 James Ridgway, Piccadilly; and all Booksellers.

Just published, in one thick volume, fcp. 8vo, (755 pp.,) price 12s. 6d. cloth,  
**A Manual of Practical Therapeutics;**  
 considered chiefly with reference to Articles of the Materia Medica.  
 By EDWARD JOHN WARING, M.R.C.S., H.E.I.C.S.  
 "Mr. Waring's Manual presents, in a concise form, the information which the medical man requires to guide him in prescribing the most suitable remedies. It will, we think, obtain favour with the medical public for the extent and usefulness of the information it contains, as well as from the fact of its filling a gap which has been felt by many."—THE LANCET.  
 London: Smith, Elder, and Co., 65, Cornhill.

Just published, price 5s., illustrated with numerous Engravings on Wood,  
**The Eye in Health and Disease.**  
 With a description of the Optometer, for the adaptation of Spectacles, for Impaired, Defective, or Aged Sight. Being the substance of Lectures delivered at the Central London Ophthalmic Hospital. By ALFRED SMEE, F.R.S., Surgeon to the Bank of England, Surgeon to the Central London Ophthalmic Hospital, &c. Second Edition; to which is added a Paper on the Stereoscope and Binocular Perspective.  
 Longman and Co., Paternoster-row; Horne, Thornthwaite, and Wood, 123, Newgate-street.

Now Ready, Part II. of  
**The Ferns of Great Britain.**  
 Illustrated by JOHN E. SOWERBY.  
 Descriptions by C. JOHNSON, Esq.  
 To contain about Forty-Six Plates, and to be completed in Eight Monthly Parts, full coloured, at 3s.; partly coloured, at 1s. 6d. per Part.

This day is published, price 2d., No. 10, of  
**The Epitomist, a Weekly Journal of Literature, Criticism, Art, Science, and Manufactures;** comprising Flotation of the highest class, Reviews of new Works, all the Scientific Intelligence of the week, a list of Patents, with abstracts of Specifications, a Domestic Miscellany, and Correspondence; 32 pages, 8vo.  
 Office, 49, King William-street (City), London.  
 Order of all Booksellers and News-vendors in the Kingdom.

**"The Times."—The "Evening Mail,"**  
 being half the price of "The Times," is published in London three times a week, on the afternoons of Monday, Wednesday, and Friday, in time for the country post. The "Evening Mail" contains all the matter of "The Times," (except the Advertisements), and includes the Second Edition of "The Times," and the Corn and Cattle Markets, &c., on the day of Publication. Subscription 32s. 6d. per half year in advance. This paper, and all the London newspapers, supplied by W. DAWSON and SONS, Abchurch-yard, and 74, Cannon-street, City, London. Established 1809.

**H. Silverlock's Medical Label Warehouse.**  
 house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.  
 The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letterpress, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.  
 Catalogues of each sort of Labels are published separately, and will be sent per post on application.

**Wanted, a Set of Quain and Wilson's**  
 ANATOMICAL PLATES, Coloured, and Good Impressions. A Bound Copy preferred.—Address, with full particulars, and price, to Messrs. H. B. Brothers, School Bookellers, 180, Aldersgate-street, London.

**Quadrilles for the Pianoforte, by the**  
 popular Composer, STEPHEN GLOVER. Each set, solo, 3s.; duet, 4s.; viz.:—The Turkish Army, the Turkish Navy, the Parrot, the Gipsy (for Dance Band, &c.), the Osborne, (for Dance Band, &c.), the Eugenie, the Green Globe, Papa's Favourite, Mamma's Favourite, the Welsh, the Nice Young Maiden's, and the Nice Young Bachelor's.

**PIANOFORTE MUSIC, by the popular Composer, STEPHEN GLOVER.**—Homage to Shakespeare, (three melodies,) 3s. Fantasia on National Airs, 3s. Papa's Favourite Galop, 2s. Mamma's Favourite Polka, 2s. Bohemian Air, Alexia, with Variations, 3d. These are choice productions of one of the most gifted Composers of the day.

**MARCHES for the PIANOFORTE, by the popular Composer, STEPHEN GLOVER.**—The Royal Militia, 2s. The Retreat, 2s. The Advance of the Crescent, 2s. 6d. The Alpine, 2s. 6d. The Bardsapalus, 3s. The Royal Hyde Park, 3s. Lord Harding's, 2s. The Royal Home, 3s. Prince Arthur's, 2s. 6d. The Hero's Last, 2s. The Great Warrior's, 2s. 6d. The Walmer Castle, 2s. 6d. The Forest Bawl, 2s. The Royal Palace Band Marches:—No. 1, (Buckingham Palace), 2s. No. 2, (Windsor Castle), 2s. No. 3, (the Pavilion), 2s. No. 4, (Walmer Castle), 2s. No. 5, (Claremont), 2s. No. 6, (Hollyrood House), 2s. Operatic Marches:—No. 1, (from La Figlia del Reggimento), 2s. 6d. No. 2, (from I Lombardi), 2s. 6d. No. 3, (from Nabuccodonosor), 2s. 6d. The Sultan's, 2s. The Turkish Cavalry, 2s. 6d. Most of the above favourite marches are elegantly illustrated.  
 London: Robert Cocks and Co., New Burlington-street, Music Publishers to the Queen.

**Water Filter for the Pocket, with DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water.** Size, 4-inches by 2. Price 3s. 9d.  
 J. SOLOMON, Wholesale Optician, and Photographic Dépôt, 22, Red Lion-square.

**Gas-heating Apparatus.—H. Mather**  
 begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Gridirons, Boiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 74, GEAY'S-LAN-LAWE, LONDON.  
 N.B.—Gas-fitting done in all its branches.

**Rice Harris and Son, Islington**  
 GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT, LOMBARD-STREET, LONDON.—PATENT SANITARY GAS SHADES.—These Shades, manufactured exclusively by RICE HARRIS and SON, on an entirely new principle, effectually destroy the effluvia and smoke, and diminish the heat, which has hitherto made the use of gas so objectionable in dwelling-houses and offices, where cleanliness and freedom from smell are of importance. They are simple and inexpensive, and may be had in a variety of forms adapted to the style of fittings or the taste of the purchaser, at the Works in Birmingham and London.

**Gold Chains and Jewellery.—**  
 WATHERSTON and BROGDEN return their grateful thanks to the nobility, gentry, and the inhabitants of Bristol and its vicinity, for the approval they have given, during the last eighteen months, to the principle sought to be established, of selling the "Gold in Chains at its intrinsic value," with the workmanship at a defined price, according to the intricacy or simplicity of the pattern.  
 WATHERSTON and BROGDEN, encouraged by the liberal patronage they have received, have made large additions to their STOCK of GOLD CHAINS, which contains every variety of pattern that can be found in the trade, including many original designs which cannot be seen elsewhere; and they take the present opportunity of inviting visitors from the country to an inspection of their Manufactory, where may be seen, in addition to Gold Chains, an elegant assemblage of JEWELLERY of the best quality, in great variety, at manufacturers' prices.  
 Manufactory, 16, Henrietta-street, Covent-garden, London.

**Patent Perambulators.**  
 C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by Appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.  
 OFFICE, 487, NEW OXFORD-STREET.  
 Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guinea.  
 CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

## The 16s. Trousers reduced to 14s.—

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 24, Regent-street.—A perfect fit guaranteed.

## Novelty in Bedsteads, adapted for

the Nursery, Sick Chamber, Sitting-room, and Drawing-room.

HAMMOND'S ORIENTAL OTTOMAN forms a Bedstead for one or two persons at a moment's notice. Price, mattress complete, 35s.—the most complete article ever introduced to the public.—

To be obtained only at HAMMOND'S Bedstead and Bedding Factory, 14, High Holborn. Designs forwarded on receipt of a postage-stamp.

## Allsopp's Pale Ale in Bottle, as

supplied to the CRYSTAL PALACE; also in casks of 12 gallons. Recommended by RAMON LIEBIG.

Address, HARRINGTON PARKER and CO., 54, Pall-Mall, London.

## Pale India Ale and Stout, 4s. 6d.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts; delivered free within four miles. Merchants supplied with Pale Ale and Porter for exportation at the lowest prices.

WOOD & WATSON, 16, Clement's-lane, City.

## Allsopp's Pale Ale.—Medical gentle-

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hoffmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 16, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BOTTLE PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTY, 132, Upper Thames-street, London.

## Good Cyder, a Preventive of Cholera.

(See THE LANCET, 16th of July, p. 33.)

This refreshing and wholesome beverage may be obtained PURE, and in the highest perfection, of WRIGHT and COOKMAN, Devonshire-wharf, Bankside, London, whose stocks are warranted the produce of the finest orchards in the best cyder districts of Devon, and made only from the choicest picked fruit.

A three dozen hamper of their celebrated pale Champagne Cyder, delivered to any railway station in London, for 33 shillings.

Wine Merchants and Victuallers supplied on liberal terms.

## Soyer's Aromatic Mustard.—"M."

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration.—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

## To Invalids and those desirous of

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO'S HOMEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

### MEDICAL MEN LOOK TO THIS!

## Mary Wedlake's "Do you bruise

your Corn?" Chaff-cutters, Oat-bruizers, and Mangel-feeding Machines. Keep two nags at the expense of one.

118, Fenchurch-street.

## Do you bruise your Oats yet?—New

Oat-crushers, £2 15s., £4 6s.; Chaff-cutters, £1 7s., £3 7s.; Mangles, £2 10s.; Flour-mills, £4 10s.—WEDLAKE and Co., 118, Fenchurch-street.—One bushel when crushed makes two.

How to Keep a Horse for 9s. a Week; or a Book on Feeding, is 4d.

### THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

## Robinson's Patent Barley, for making

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants, Children, and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS form another Diet universally esteemed for making a superior Gruel in Fifteen Minutes,—light for supper,—and alternately with the Patent Barley is an excellent Food for Children and Invalids, being particularly recommended by the Faculty as the purest and best Preparation of the kind extant, and far preferable to the Embden Groats.

Prepared only by the Patentees, ROBINSON, BELLVILLE & Co., Parveyors to the Queen, 64, Red Lion-street, Holborn, London.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets of 6d., and 1s., and in Family Cansisters at 2s., 6s., and 10s. each.

## Sp. Vin. Rect. fully 56° overproof.—

We are now invoicing this fine Spirit at 18s. 6d. per Gallon, subject to a Discount of a Shilling for Cash on delivery in London; not otherwise.

HENRY BRETT & CO., Old Farnival's Distillery, Holborn.

## Dr. Ure and Dr. Letheby, having

analyzed our EAU DE VIE, concur in pronouncing it "a Spirit of undoubted purity, applicable to every purpose for which Brandy is required," and in several respects preferable to COGNAC. Imperial Gallon, 16s. A Case containing a Dozen French Bottles, with French labels, 34s. Cash.

HENRY BRETT & CO., Old Farnival's Distillery, Holborn.

## Brett's Ginger Brandy, for Diarrhoea.

A powerful astringent, carminative, and delicious Liqueur. Imperial Gallon, 18s. In Pint and Quart Wine-bottles, 20s. and 36s., by the Dozen. Beware of deleterious counterfeits.

HENRY BRETT & CO., Old Farnival's Distillery, Holborn.

## London Hospital Medical College.—

INAUGURATION FESTIVAL.—The DINNER will take place at the LONDON TAVERN, BISHOPSGATE-STREET, on Monday, October 2nd, at Half-past Five for Six o'clock, JAMES LUKE, Esq., Senior Surgeon to the Hospital, &c. &c., in the Chair.

### STEWARDS.

NICHOLAS PARKER, M.D., Hon. Sec., Finsbury-square.

GREAT REDUCTION IN PRICE OF

# Sir William Burnett's Disinfecting

FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d.

This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street, London-bridge.—N.B. Beware of a spurious imitation.

## The Cholera Prevented by the

destruction of all noxious effluvia.

CREWS'S DISINFECTING FLUID. Recommended by the College of Physicians. The cheapest and strongest CHLORIDE OF ZINC. Quarts, 2s.; Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED. FURTHER GREAT REDUCTION IN PRICE.

## Crews's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crews's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 5s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

## Important Saving, by Pre-payment,

in the PURCHASE of

NEW WHITE MOULDED VIALS.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSELY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

## Purification of Linen—Prevention of

DISEASE.—J. BOILESSVE, 55, King William-street, City, London, solicits the attention of the Nobility and Gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

60, Marylebone-lane, London, Feb. 2nd, 1854.

SIR,—I have much pleasure in informing you, that I am entirely satisfied with the performance of your No. 3 Calorifere, lately put up for warming my manufactory; it has been in operation for a month, and I believe it to be the best and most economical means of drying yet invented, and particularly suited to my business, as there is no dust arising from its use, as there is from the old stoves. The consumption of coke is about one bushel per day.

I am, Sir, yours truly,

SAMUEL HUBERT,

To J. Boilessve, Esq. Firm of JOHN WOOLLAWS and Co., Paper-stainers.

## Warming and Ventilating, by Hot

AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOILESSVE, C.E., 55, King William-street, City of London,

respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

New Independent Chapel, Longsight, Manchester,  
January 10th, 1853.

SIR,—I am instructed by the building committee of the above Chapel to order one of your No. 3 Calorifere, for heating and ventilating the School in connexion therewith. As the sub-committee, upon examination of most of the public buildings, churches, and chapels in the town, find such general dissatisfaction with the existing apparatus and their imperfect heating and ventilation, they have examined your Calorifere as in operation, and believe it best adapted to meet their wants. It is intended, should it prove successful, to apply another apparatus to the chapel.

To J. Boilessve, Esq.

SAMUEL RIGBY, Secretary.

New Independent Chapel, Longsight, Manchester,  
April 12th, 1854.

DEAR SIR,—I am authorized to inform you that the No. 4 Calorifere, erected to warm the Longsight Independent Chapel, is in every respect satisfactory to the committee and the congregation.

Yours respectfully,

To J. Boilessve, Esq.

ROBERT RUMFET, Chairman.

## Mineral Waters.—W. Best begs to

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seidlitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-de-Cologne, Arquebuzard, and Foreign Mineral Water Depot, 23a, Henrietta-street, Cavendish-square.—N.B. Balls and evening parties supplied with German and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

## Struve's Seltzer, Fachingen, Vichy,

and other MINERAL WATERS. Under her Majesty's especial patronage.—ROYAL GERMAN SPA, BRIGHTON. The Pump-room and Promenades, offering every facility for a Course of Mineral Waters as perfect and beneficial as at the natural springs, are NOW OPEN for the 30th Season. Orders for Struve's Bottled Mineral Waters continue to be executed by George Waugh and Co., Chemists to the Queen, 177, Regent-street (west side), London, and by numerous other respectable houses in London and the provincial towns, where a printed account of Struve's Mineral Waters may be obtained gratis.

CAUTION.—Struve and Co. have no connexion with waters advertised under the general designation of "Brighton Seltzer," "Brighton Fachingen," &c., and every genuine bottle of Struve's Waters has the name of "Struve" on the label, as well as on both sides of the red-ink stamp over the cork, having the words "Royal German Spa, Brighton," under the Royal Arms.

## By Her Majesty's Royal Letters

PATENT.—T. MAYO, WATSON, and CO., 2, BERNERS-STREET, OXFORD-STREET, LONDON, Manufacturers of Mineral Erated Waters, and Patentees of the Syphon Vase and Valvular Stoppered Bottle. The objection so generally made to the common soda-water bottle, in the inconvenience attending its being opened, has induced Messrs. T. Mayo, Watson, and Co., in addition to the Syphon Vase to introduce the VALVULAR STOPPED BOTTLE, whereby the annoyance complained of is removed, the use of both corks and wire being dispensed with, and the advantages arising to those who are in the habit of drinking erated waters (more especially ladies and invalids) greatly enhanced, from the circumstance that any quantity, however small, can be withdrawn, whilst, at the same time, the application having in the bottle retains its gaseous properties unimpaired.—Applications having been made to them for agencies for the sale of the Syphon Vase and Valvular Stoppered Bottle, Messrs. T. Mayo, Watson, and Co. have now made arrangements accordingly, and will be happy to treat with parties desirous of becoming agents.

## HYGIENIC BATHS.

JENSEN'S TONIC

## DAPHNE MARINA SALT FOR BATHS

When dissolved in a Cold, Tepid, or Warm Bath, imparts so eminently strengthening and beneficial properties to the same, that, when once tried, a Bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known Sea Bath.

Sold at 1s. per packet, by the Proprietor, C. MEINTE, 103, Leadenhall-street, and 213A, Piccadilly, (near Regent-circus,) and by all Chemists, and Bathing Establishments.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lytta P.L., easily applied and removed, and will not produce strangury or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from the speaking of them in the highest terms. The 'Cantharidine Plaster' is most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction."

60, Grosvenor-street, London.

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. Brown's BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Strangury.

"ANDREW SMYTH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 43, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignees, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

**Cocoa-nut Fibre Matting and Mats,**  
of the best quality.—The Jury of Class 28, Great Exhibition, awarded the Prize Medal to T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate-hill, London.

**Metcalf and Co.'s New Pattern**  
TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 180 and 181, Oxford-street, second and third doors west from Holles-street. Metcalf's Alkaline Tooth Powder, 2s. per box.

**Darby and Gosden beg to call**  
the attention of the Medical Profession to their CHARCOAL RESPIRATORS, made according to the principle recommended by Dr. STENHOUSE, as a preservative from contagious diseases or a poisonous atmosphere. They have been approved of by the Society of Arts in Edinburgh, and many eminent Physicians and Professors of Chemistry in London.—An inspection of their powers requested.  
140, LEADENHALL-STREET, CITY.

**Elastic Supporting Belts, of the same**  
beautiful fabric as Pope and Plante's Elastic Stockings for Varicose Veins. Those for ladies' use, before and after accouchement, are admirably ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed.

Instructions for measurement and prices on application, and the articles sent by post from the manufacturers, POPE and PLANTE, 4, Waterloo-place Pall Mall, London.

**PATENT SELF-ADJUSTING TRUSSES.**  
**Salmon, Ody, and Co., most respect-**  
fully inform the Public, that their Patent Self-adjusting Trusses afford more ease and security for the relief of HERNIA than any other instrument for the purpose. They will answer for right or left side, requiring no under-strap or any galling bandage. Persons in the country are requested to send the circumference of the body one inch below the hips.

CAUTION.—As many mercenary druggists are vending an inferior article, purchasers are requested to observe that SALMON, ODY, and CO., 292, Strand, London, is marked upon the leather case.  
Sold by one or more druggists in every city and principal town in the United Kingdom.

**TO THE MEDICAL PROFESSION.**  
**Fr. G. Ernst, Anatomical Machinist**  
and MANUFACTURER OF SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam ERNST (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchement-belts, &c.

**Scientific Professional Apparatus,**  
manufactured and sold by HORNE, THORNTON, and WOOD, 121 and 123, Newgate-street, London, who invite attention to the following articles, which have given universal satisfaction:—  
MEDICAL ACHROMATIC MICROSCOPES, in Case, for Anatomical Urinary Deposits, &c., £2 10s., £5 5s., and upwards.  
ELECTRO-GALVANIC MACHINES, giving a uniform current of galvanism of great quantity, and of the only form and construction suitable for Medical Application, in portable Case, £3 3s., £5 5s., and £8 8s.  
URINOMETERS, gilt metal, 14s.; glass, 4s. 6d. In Case, for pocket, with Thermometer, Acid, &c., 21s. and 35s.  
APPARATUS and TESTS for ANALYSES of URINE and TOXICOLOGY in Cases, £3 3s., £5 5s., and £10 10s.  
\* Any required information and price-lists forwarded on application.

**Meinig's Electro-Generator,**

FOR CHOLERA.

TO THE MEDICAL PROFESSION.

Having witnessed personally the greatest benefit, in the first stages of Cholera, derived from the application of weak, continuous currents of Electricity from the spine to the abdomen, by which the warmth and action of the digestive organs is maintained, and the urinary functions stimulated; and feeling confident that in an advanced stage of the disease strong, uninterrupted Electric Currents passed along the cramped and paralyzed limbs, and along the spinal column, will be found of paramount efficacy in restoring normal circulation, Mr. Meinig earnestly invites the Medical Profession to test and investigate the effects of Electricity in the now prevalent epidemic; and so confident does he feel of the all but marvellous success of his Apparatus in this dreadful disease, that any medical gentleman who desires it may receive Mr. Meinig's warrant, to the effect that he will retake and repay, within one month after the purchase, any Apparatus which, after trial, it might be wished to return.

Prices of the Portable Generator: 5s., 10s. 6d., 15s., 20s., and 30s., according to power. Powerful Pocket Batteries, £3 3s.  
103, LEADENHALL-STREET, and 213A, PICCADILLY.

TO ARMY AND NAVAL SURGEONS.

**A Complete and almost New Set of**  
SURGICAL INSTRUMENTS of a deceased Surgeon in the Navy, to be Sold, at a very moderate price.—Apply to Mr. D. M'Dougall, 7, Sarah-terrace, Hill-street, Walworth.

**Anatomical and Dental Repository,**  
45, Museum-street, Bloomsbury, London.—JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

**Railway Travellers, and all persons**  
suffering from weakness, should obtain one of W. S. SPARKS'S newly-invented URINALS, for night and day use, for both male and female. They are made on the most approved principles, so as to prevent any unpleasantness, are very durable, and at prices within the reach of all. W. S. also manufactures all articles in India-rubber and gutta-percha for invalids, including bed-pans, sheeting, water and air cushions, pillows and mattresses, hearing-tubes, portable baths, elastic bandages, stockings, knee-caps, &c. &c. Water-beds on sale or hire. The medical profession, hospitals, and country dealers supplied on the best terms, and circulars, &c. forwarded on application.—W. S. SPARKS, India-rubber Manufacturer, 115, New Bond-street.

**Walters' India-rubber**  
URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

Made of Solid India-rubber, with Patent Valve, and adapted for Ladies, Gentlemen, and Children.

Manufacturer also of the PATENT HYDRO-STATIC TRUSS. One of the advantages of this Truss is, that the pad, being filled with water, adapts itself with perfect accuracy to the form of the body, thereby keeping up a firm but easy pressure on the internal ring.

F. WALTERS,

16, MOORGATE-STREET, LONDON.

**Mr. Bourjeaud's Registered Elastic**  
APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1.

FIG. 2.

**FIG. 1. BELT AND AIR-PAD FOR PROLAPSUS UTERI OR ANI.**—Mr. Bourjeaud begs to state that the apparatus here figured has been found extremely useful in cases of prolapsus uteri or ani, and with patients, especially females, who require support for the perineum. The compressing agent is a caoutchouc bag, filled with air; it is in the diagram hanging loose in front of the patient, and is fixed in its place by the strips of elastic tissue, the free extremity of which is seen. The latter is fixed to the lower and posterior margin of the belt, and by the elasticity of the bag and straps sufficient compression is made, and not the slightest uneasiness is experienced. This is a most valuable adjunct to surgical and obstetrical practice, and is highly appreciated by the most eminent members of the profession.

**FIG. 2.** This is a most useful belt, called the ABDOMINAL SUPPORTER. It is made of varying strength, to suit the peculiarities of patients, and is most useful during gestation or after parturition, to forestall the uncomfortable state called pendulous abdomen. During gestation, it relieves the veins from the pressure of the distended womb, and thus prevents swelling of the legs; and after the birth of the child it is most valuable to those ladies who are anxious for the look of their waists. This belt is most useful in cases of dropsy, especially when ovarian, as the pressure may be increased so as to conduce, in favourable cases, to the absorption of the fluid. Mr. Bourjeaud cannot too strongly recommend this belt to corpulent people; they will find it a real comfort.

# The London and Provincial Medical

PROTECTION and BENEVOLENT SOCIETY, 48, Lincoln's-in-fields, London. Conducted by a responsible Committee of Medical Practitioners.

PRESIDENT.

JOHN PROPERT, Esq.

TRUSTEES.

John Bowling, Esq., Hammer-smith. | Horatio Day, Esq., Isleworth.  
James Clayton, Esq., Percy-street. | J. Probert, Esq., New Cavendish-st.  
Nathaniel Clifton, Esq., Islington. | G. Webster, Esq., M.D., Dulwich.

The objects of this Society are—

1st. To secure the more regular payment for professional services, and to adopt measures for the benefit and advancement of the general interests of medical men.

2nd. To negotiate the Transfer of Practices, Partnerships, and the providing of Assistants and Pupils.

Assistants are charged Two and Sixpence for registration.

3rd. To establish a fund for benevolent purposes.

Annual Subscription, One Guinea; a firm, consisting of two partners, a Guinea and a Half; a firm of three partners, Two Guineas. No unqualified person can be admitted a Member of the Society.

The Trustees and Committee are responsible for all moneys paid to the Society, and also for the integrity of their agents.

JOHN CAPES, Esq., Secretary-Superintendent.

EAST INDIA HOUSE, August 9th, 1854.

## Notice is hereby given, that the

annexed CODE OF REGULATIONS for the ADMISSION of CANDIDATES at the First Examination, to be held in January next, for the APPOINTMENT of ASSISTANT-SURGEONS in the service of the EAST INDIA COMPANY, has been framed by the Board of Commissioners for the Affairs of India, under the provisions of the Act 16 and 17 Viet., cap. 95, sec. 38.

REGULATIONS FOR THE ADMISSION OF CANDIDATES FOR THE APPOINTMENT OF ASSISTANT-SURGEON IN THE SERVICE OF THE EAST INDIA COMPANY.

All natural-born subjects of her Majesty may be candidates for admission into the service of the East India Company as Assistant-Surgeons; they must, however, be between twenty-two and twenty-eight years of age, and of sound bodily health.

They must subscribe and send in to Dr. Scott, the Physician to the Hon. East India Company, before the 10th day of December, 1854, a declaration to the following effect:—

"I [Christian and surname at full length], a candidate for employment as an assistant-surgeon in the service of the East India Company, do hereby declare that I was — years of age on the — day of — last, and that I labour under no constitutional disease or physical disability that can interfere with the due discharge of the duties of a medical officer; and I attest my readiness to proceed on duty to India within three months of receiving my appointment."

This declaration must be accompanied by the following documents:—

1. Proof of age, either by extract from the register of the parish in which the candidate was born, or by his own declaration pursuant to the Act 6th and 6th William IV., esp. 62.
2. A diploma in surgery or a degree in medicine, provided an examination in surgery be required for such degree, from some body competent by law to grant or confer such diploma or degree.
3. A certificate of having attended two courses of lectures, of six months each, on the practice of physic, and of having attended for six months the practice and clinical instruction of the physicians at some hospital containing, at least, on an average, 100 in-patients, or of having attended one course of lectures of six months on the practice of physic and clinical instruction for twelve months.
4. A certificate of having attended for three months the practical instruction, given at one of the public asylums for the treatment of the insane.
5. A certificate of having attended for three months one of the institutions, or wards of a hospital, especially devoted to the treatment of ophthalmic disease.
6. A certificate of having attended a course of lectures on midwifery, and of having conducted at least six labours.
7. A certificate of having acquired a practical knowledge of cupping.

Candidates may also, at their option, send in certificates of attendance at any hospitals, or on any courses of lectures in addition to the above. Attendance on a course of military surgery is recommended.

Candidates producing satisfactory certificates will be admitted to an examination, to be held in January, 1855.

The examination will include the following subjects:—

1. Surgery in all its departments.
  2. Medicine, including the diseases of women and children, therapeutics, pharmacy, and hygiene.
  3. Anatomy and physiology, including comparative anatomy.
  4. Natural history, including botany and zoology.
- The examination will be conducted—
1. By means of written questions and answers.
  2. By object examinations and experiments, when the subject admits of such tests.
  3. By practical examination at the bedside of the patient, and by dissections and operations on the dead body.
  4. By *visu oculo* examination.

The persons who shall be pronounced by the examiners to be the best qualified in all respects, shall be appointed to fill the requisite number of appointments as assistant-surgeons in the East India Company's service.

All assistant-surgeons are required to subscribe to the military or medical, and medical retiring funds at the Presidencies to which they may be respectively appointed, and to the Military Orphan Asylum also, if appointed to Bengal.

All assistant-surgeons who shall neglect or refuse to proceed to India under the orders of the Court of Directors, within three months from the date of their appointments, will be considered as having forfeited them, unless special circumstances shall justify a departure from this regulation.

Candidates may apply to Dr. Scott, 13, Stratton-street, for further information, if needed.

N.B. The certificates and notices as to examination herein contained apply only to the examination to be held in January next.

Regulations regarding the requirements of candidates for future examinations will be issued after the first examination.

JAMES C. MELVILLE, Secretary.

# New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES.—449, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.

CAPITAL, £100,000.

TRUSTEES.

SIR JAMES DUKE, Bart., Ald., M.P.  
WILLIAM FERGUSSON, Esq., F.R.S.  
SIR CHARLES HASTINGS, M.D., D.C.L.  
GEORGE JAMES GUTHRIE, Esq., F.R.S.

DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.  
GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

The progress of the Company, from its commencement to the end of the year 1853, is shown at a glance in the subjoined Table:—

	Number of Policies issued.	Sums Assured.	Annual Premiums.
1851	301	£ 93,600	£ 3,499 0 1
1852	477	279,855	10,008 12 3
1853	1025	413,785	15,836 3 6

## MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DULY-QUALIFIED MEDICAL PRACTITIONERS as the MEDICAL ADVISERS of the COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.

MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. ON ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES REFLECTED THROUGH THEIR INTRODUCTION.

## EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and influential AGENTS wanted.

# University College, London.—

FACULTY OF MEDICINE. SESSION, 1854-55.—The Classes will Commence on Monday, the 2nd of October. Introductory Lecture by Professor CAKERTWYK, M.D., at Three o'clock.

Classes in the order in which Lectures are delivered during the day:—

## WINTER TERM.

Anatomy—Professor Ellis.  
Anatomy and Physiology—Professor Sharpey, M.D., F.R.S.  
Chemistry—Professor Graham, F.R.S.  
Comparative Anatomy—Professor Grant, M.D., F.R.S.  
Surgery—Professor Erichsen.  
Medicine—Professor Walshe, M.D.  
Dental Surgery—Hubert Shelley, M.B.  
Practical Anatomy—The pupils will be directed in their studies during several hours daily by Professor Ellis and Dr. Boon Hayes, Demonstrator.

## SUMMER TERM.

Botany—Professor Lindley, Ph. D., F.R.S.  
Pathological Anatomy—Professor Jenner, M.D.  
Palaeo-Zoology—Professor Grant, M.D.  
Practical Chemistry—Professor A. W. Williamson, Ph. D.  
Midwifery—Professor Murphy, M.D.  
Forensic Medicine—Professor Carpenter, M.D., F.R.S.  
Ophthalmic Medicine and Surgery—Professor T. W. Jones, F.R.S.  
Materia Medica—Professor Garrod, M.D.

Analytical Chemistry—Professor Williamson, throughout the Session.  
Logic, French, and German Languages, Natural Philosophy, Geology, and Mineralogy—according to announcement for the Faculty of Arts.

## CLINICAL INSTRUCTION.

Hospital Practice daily throughout the year.

Physicians—Dr. Walshe, Dr. Parkes, and Dr. Garrod.  
Obstetric Physician—Dr. Murphy.  
Assistant-Physicians—Dr. Jenner, Dr. Hare.  
Surgeons—Mr. Quain, Mr. Erichsen.  
Consulting Surgeon to the Eye Infirmary—Mr. Quain, F.R.S.  
Ophthalmic Surgeon—Mr. Wharton Jones.  
Assistant-Surgeons—Mr. Marshall, Mr. Statham.  
Dental Surgeon—Mr. Shelley.  
Medical Clinical Lectures by Dr. Walshe and Dr. Garrod; also by Dr. Parker, Professor of Clinical Medicine, whose special duty it is to train the pupils in the practical study of disease, and who gives a series of lessons and examinations on the Physical Phenomena and Diagnosis of Disease to classes consisting of a limited number, and meeting at separate hours.  
Surgical Clinical Lectures, specially by Mr. Quain; and by Mr. Erichsen.  
Lectures on Ophthalmic Cases, by Mr. Wharton Jones.  
Practical Instruction in the Application of Bandages and other Surgical Apparatus, by Mr. Marshall.

Prospectuses may be obtained at the office of the College.  
RESIDENCE OF STUDENTS.—Several of the Professors receive students to reside with them; and in the office of the College there is kept a register of parties unconnected with the College who receive boarders into their families. Amongst these are several medical gentlemen. The register will afford information as to terms and other particulars.

G. VINER ELLIS, Dean of the Faculty.

CHAS. C. ATKINSON, Secretary to the Council.

August, 1854.

The Lectures to the Classes of the Faculty of Arts will commence on Tuesday, the 17th of October.

The Junior School will open on Tuesday, the 26th of September.

## Lectures

ON

## DISEASES OF THE JOINTS.

*Delivered at St. Mary's Hospital.*

BY WILLIAM COULSON, Esq.

SURGEON TO THE HOSPITAL.

## LECTURE VII.

## ABSCESS OF JOINTS.

GENTLEMEN.—In my preceding lectures I have described diseases of the joints under three conditions—namely, as they may be seated in the synovial membrane, in the cartilages, or in the cancellous structure of the articular extremities of bones. You must, however, have observed, that in following this anatomical division, as it might be called, I did not lead you much beyond the earlier and middle stages of each class of diseases; and the reason of this was, that it is only in the earlier periods we are enabled to distinguish, with any degree of certainty, the particular class of the disease, or, what comes to the same thing, the particular tissue in which it may have taken its origin. But when articular diseases have continued for any length of time, they have a tendency to assume more or less of the same appearance, in proportion as the whole joint becomes involved in the affection; than a certain train of symptoms, which we may designate as the third stage, sets in. These symptoms are chiefly connected with the occurrence of abscess within the joint, and with the destruction of parts consequent thereon. They are not always present, for some articular diseases have little tendency towards suppuration; but the majority of severe diseases of the joints, if unchecked, lead to suppurative inflammation. This may occur more slowly in some cases than in others, and the subsequent phenomena may follow a different sequence in different joints, but in the end the results are the same—abscess, and greater or less destruction of the joint.

Hence it becomes necessary for us to study the third stage of articular disease, and examine the principal points connected with it—namely, abscess, secondary luxations, ankylosis, excision of the heads of bones, and amputation. In so extensive a range of subjects, I can of course merely direct your attention to the leading facts of practical importance connected with each. Let us commence with abscess.

The formation of matter, during the course of articular disease, may take place under two circumstances, which you must be careful to distinguish from each other. The abscess may depend on inflammatory action in the soft parts external to the joint, to which it is confined, having no communication with the articular cavity: this I would denominate peri-articular abscess; or the secretion of matter may be an effect of inflammation within the joint, the pus is effused in the cavity of the joint, and is either confined to that cavity, or has made its way into the soft parts by perforation of the capsule.

Abscesses of joints may also be distinguished into acute and chronic. The acute are generally either the effect of injury, or of that constitutional state known by the name of purulent infection. Chronic abscess occurs during the progress of chronic disease of the articulation, and it is to this form alone that I propose to direct your attention.

You will find it laid down in books, that the formation of matter within a joint is marked by certain general symptoms, which denote the passing of inflammatory action into the suppurative stage; but I must caution you against placing too much reliance on these rational signs, for they are often very obscure, or even absent altogether, on account of the low degree of inflammation which suffices for the secretion of pus in scrofulous individuals. In some cases, however, when the joint is large, the patient not much reduced, and the inflammatory action severe, we observe certain constitutional symptoms which indicate the formation of matter within the joint. When the pulse becomes accelerated, the pain in the joint is greatly aggravated, painful startings of the limb occur, and when the incipient symptoms of hectic fever soon follow, we may rationally conclude that suppuration has taken place. Still no decided opinion can be given without a most careful examination of the joint; and even this, it must be confessed, does not always lead to certainty of diagnosis. Many important questions are to be determined, yet our means of forming a judgment are limited.

In many cases there is no difficulty in ascertaining that the

joint contains some fluid, and then the first point we have to ascertain is, whether this fluid be pus or serum. If the history of the case should lead us to conclude that the disease has been inflammation of the synovial membrane, it is extremely probable that the contents of the joints are serum, not pus. Should any doubt exist, Sir Benjamin Brodie recommends us, in the first instance, to make a puncture with a grooved needle, and thus ascertain the nature of the fluid contained in the articular cavity. This of course can easily be done when the joint is a superficial one, but it is very difficult to determine by any mode of examination the existence of abscess, at an early stage, in the deep-seated joints of the hip or shoulder. It may also be useful to remember, that when the joint contains serum or synovia, the peri-articular tissues and integuments are much less involved and less infiltrated than when the disease is one leading to an effusion of pus.

In more chronic cases, and particularly in those of a scrofulous nature, it is still more difficult to determine, with any degree of certainty, the existence of intra-articular abscess, because the alterations which have taken place in the soft parts surrounding the joint prevent us from examining the state of its cavity in a satisfactory manner. Here the two circumstances already alluded to must be taken into consideration. The abscess is confined to the cavity of the joint, or it has perforated the capsule, and is making its way to the external surface. In the former case, that is to say while the fluid is still confined within the articular cavity, it is impossible to be certain whether it be pus, or a mixture of serum with other secretions. The general condition of the patient, and the history of his disease, are the main points on which we must rely in forming an opinion. If the general health of the patient is bad, if he exhibits any signs of a scrofulous constitution, then, in all probability, the fluid contained within the joint is pus. Again, you must look to the nature of the lesions which have preceded or which accompany the effusion of fluid within the joint. If inflammatory action in the outset has been followed by symptoms of ulceration of the cartilages, or by the still more characteristic signs of destruction of the osseous tissue, you may be certain that the fluid is of a purulent nature.

When the capsule of the joint has been perforated, and the matter is making its way towards the external surface, the same difficulties of diagnosis no longer exist. Fluctuation is now more easily determined, and when this is accompanied by the changes which take place in the soft parts during chronic disease, we may be certain that the fluid is pus, for no other fluid secretion is mixed with the adventitious structures deposited around scrofulous joints. The nature of the fluid, then, may be ascertained in most cases; but it is not always easy to say whether the abscess is an intra-articular one, making its way towards the external surface, or whether it be a peri-articular collection, extending on the one side towards the integuments, and on the other towards the joint. In cases of this latter kind, great attention must be paid to the history of the case, and to the order in which the different lesions have followed each other. We must endeavour to ascertain whether the formation of the external abscess was preceded by symptoms indicating suppuration within the joint; we must follow the course of the abscess, and try to determine whether it takes a sinuous course, or leads more or less directly towards the cavity of the joint; lastly, we must examine the state of the joint itself, and ascertain, as far as we can, whether it be uninjured, or whether the signs of ulceration, &c., be present. In the latter case, we may conclude that the abscess is a perforating one; but even here there is a source of error, for I have seen cases in which, after perforation of the joint, and effusion of nearly all the pus into the surrounding tissues, the articular cavity appeared to be so free from disease that one might readily conclude the abscess was confined to the parts external to the joint.

The treatment of abscess of joints involves many points of great practical importance, yet we must admit that it has not arrived at anything approaching perfection, if we reflect on the very different opinions entertained by the best surgeons in this and other countries. The principal questions on which practitioners are divided are, the propriety or expediency of opening abscesses connected with joints, and also the manner in which such opening should be made. Some prefer leaving the abscess entirely to nature; others recommend small and repeated punctures, aided by compression; while other surgeons, again, with whose opinions I agree, advocate free and early incisions. That this is the best method we can adopt for the treatment of peri-articular abscesses which do not communicate with the cavity of the joint, I entertain little doubt, and I am inclined to believe that it may be extended also with advantage to many cases of perforating abscess of the

articulations. It is a necessary condition of this practice that the joint should be freely opened, for there is then less danger of that general inflammation of the cavity which surgeons so much dread.

The changes which take place in a joint during the existence of abscess, and generally speaking in the latter stages of articular disease, are extremely various. During a certain time they will depend, in some measure, on the primary form of the disease, and on the tissue in which it has commenced. They may, as I have said, gradually proceed to complete destruction of the joint, or they may become arrested, a reparative process setting in, and a cure effected by ankylosis. Let us now consider this mode of termination. Ankylosis is the name applied to the greater or less immobility of the joint which succeeds disease, and depends on a fibrous or osseous union between the parts entering into its composition. It is, in a word, a mode of reparation like that resulting from the formation of a cicatrix or the deposit of callus; it may follow various lesions of the joint, and have its seat in different tissues; it may be external to the joint or internal; it may be entirely osseous or fibrous, or a mixture of both. All these differences will depend on the nature and extent of the previous disease, and probably on the age or constitution of the patient. After extensive destruction of the articular cartilages of a joint, the new osseous matter may be thrown out in such quantity as to produce complete adhesion between the opposite denuded surfaces; in other cases, one of the bones seems lodged in a kind of cavity formed in the other, or the osseous matter may proceed from the outer shell of the bone, forming a bridge or splint, and sometimes a complete circle, which locks the bones together in a kind of case. Soft ankylosis is produced by adhesions or bands of unyielding fibro-cellular tissue, which pass from one bone to another, or are deposited in the ligamentous structures external to the joint. Finally, we may have a false ankylosis, in which the bones are unchanged, and the ligaments but little altered, the stiffness and immobility of the joint depending on fibrinous deposit exterior to the capsule, but chiefly on a rigid and contracted state of the muscles connected with the joint.

The diagnosis of ankylosis presents no difficulty; for it is easy to see that the joint is rigid or immovable, but this teaches us nothing in a practical point of view. The surgeon's main object is to afford relief; and in order to direct his efforts in a rational manner, he must endeavour to ascertain, with some degree of precision, the nature of the lesions which impede the motions of the limb. It is evident that nothing but disappointment could be the result if we were to apply to a complete osseous ankylosis the treatment suited for immobility depending on fibrinous deposit or altered muscular action. The first question, then, which you will have to determine, is the degree of immobility caused by the ankylosis; and this point alone, if properly investigated, will throw much light on the whole nature of the case. The patient should be encouraged to move the limb; and, if quite unable to do so, the surgeon must make the experiment himself, care being taken that one of the bones is firmly fixed, while an effort is made to move the other with the hand. The extent, however, to which the heads of the bones are movable can seldom be ascertained without the assistance of mechanical means, in the use of which the utmost caution must be observed. The impediment to motion, as I have said, may depend on contraction of the muscles, on fibrinous deposits in the soft parts or bones, or osseous union; hence your attention will be directed to these three points. To ascertain how far the muscles are involved, you must test their condition with the fingers, while attempts are being made to move the joint. If they are not hard and contracted, and if their relaxation has no influence on the mobility of the joint, you may reasonably conclude that they offer no impediment to its motion. The slightest motion in the joint is sufficient to show the absence of osseous ankylosis; but we cannot safely reverse the proposition, and affirm that bony union exists because the joint is completely immovable. This latter condition may be the result of fibrinous ankylosis, combined with irregularities of the osseous surfaces, which permit one bone to become encased as it were within the other. Fibrinous ankylosis is an ordinary result of scrofulous disease, and we may be pretty certain that we have to deal with this form when the ankylosis has supervened after the healing of fistulous abscesses and subsidence of scrofulous tumefactions of the joint.

The treatment of ankylosis will vary according to its nature, whether osseous or fibrinous. In the former case, little or nothing can be done, for I cannot advise you to imitate the practice of M. Louvrier, nor has experience yet pronounced on the method proposed by Mr. Barton, an American surgeon,

who made an artificial joint by dividing the shaft of the bone below the ankylosed joint. In cases of fibrinous ankylosis, our first object is manifestly to restore, as soon as possible, the natural motions of the joint; and it is consoling to know that a great deal may be done in this way by judicious management. As long as any trace of active disease exists within the joint, we must abstain from artificial motion; but when this has disappeared, gentle motion should be commenced, sometimes with the hand, sometimes with instruments, and the movements gradually prolonged, care being taken to interrupt them whenever they excite any pain. Stimulant frictions, shampooing, douches, and the vapour-bath, may also be employed with great advantage. When the limb has become ankylosed in a false position, special contrivances must be had recourse to for the purpose of bringing it back to an useful if not normal direction. This also must be effected in a slow and cautious manner; and when we have obtained the object, I am of opinion that all has been effected which it is prudent to undertake. In many old cases of ankylosis, especially when the knee-joint is the seat of deformity, the flexor muscles are so rigid and contracted, that gradual extension by instrument either fails to straighten the limb, or must be abandoned from the excessive pain it produces. Here great benefit has been derived from division of the tendons of the retracted muscles and aponeurotic bands; and the great success which the late Professor Dieffenbach obtained by this method would certainly appear to claim for it more attention than it has received in this country.

The extensive destruction of cartilages, bony structures, and ligamentous tissues, which sometimes takes place during the progress of articular disease, may so far diminish the bonds of union between the opposite surfaces of a joint, that the bone escapes from the articular cavity, and secondary luxation is the consequence. I have already described to you the circumstances under which these luxations are produced, and the various kinds of displacement that may occur in each joint, I shall now, therefore, merely add a few remarks relative to their treatment. This is either preventive or curative; and I need hardly remind you that the former is of infinitely greater importance than the latter, from which little can be expected. During the treatment of chronic articular disease, you must always bear in mind the possibility of its giving rise to secondary displacement of the joint; and you must also reflect on the principal circumstances which favour such displacement, for it is by avoiding or removing the causes that we have the best chance of obviating their results. Now when the connecting parts of a joint have been destroyed by disease to a certain extent, the principal causes which may subsequently produce secondary dislocations, are muscular contractions and faulty positions of the affected limb. Indeed, both these causes are generally combined in effecting the displacement, and the means proper for avoiding the one will be applicable to the other likewise.

I have already described what I conceive to be the best position for each articulation, and I shall now briefly allude to the general rule—viz., that in determining this you have to consider what position is least likely to cause undue pressure on the ligaments or capsule of the joint so as to favour separation of the articular surfaces from each other; and also what position is best calculated to insure, in case of ankylosis, an useful direction of the extremity. It fortunately happens that, generally speaking, the same position which is the best in cases of ankylosis, is also the best calculated to obviate the effects of muscular contraction and the tendency to displacement. Thus, for example, when the lower extremity is kept nearly straight, with its axis in the same direction as that of the trunk, when any undue degree of rotation is avoided, and the foot sustained in such a manner as to form a right angle with the leg, then is the danger of secondary luxation diminished as much as possible, and if ankylosis should take place, the limb is in the most favourable position. When luxation has once taken place, it becomes a matter of serious consideration whether it admits of any relief from the hands of the surgeon. For my own part, I believe that in the great majority of cases, if large joints be implicated, little or nothing can be done to remedy the deformity. The elbow-joint is perhaps the only one to which attempts at reduction of secondary dislocations can be applied with much prospect of success. Here the head of the radius may be dislocated outwards and backwards, and no very great difficulty may be experienced in restoring it to its place, by bringing the arm to a middle state between pronation and supination, while firm pressure is at the same time exercised on the head of the bone. A proper apparatus must then be applied, and its use continued for a considerable time. When you reflect on the great destruction of the

various parts of a joint which must have taken place before its articular surfaces can be separated from each other, on the diseased condition of the bones, and on the contracted state of the muscles or ligamentous fibres which exists whenever the dislocation is of any standing, you can easily perceive both the difficulty of effecting a reduction, and the probable inutilty of such a proceeding, even if it can be carried into execution. In the knee-joint, for example, the resistance of the fibrous bands can seldom be overcome; and the irregularities of the bony surfaces, from extensive destruction, are such that little or no advantage would be gained by bringing them again into juxta-position after displacement. Secondary luxation of the head of the femur usually takes place on the dorsum ilii; occasionally, also, into the obturator foramen. I shall presently, in speaking of excision, notice the changes by which such displacements are accompanied, and shall endeavour to appreciate their influence on any mode of treatment employed; for the present we may ask—Is it possible to reduce a secondary luxation on the dorsum ilii, and if so, is it advisable that such an attempt should be made under any circumstances? These are questions not easily decided in the actual state of our knowledge, for little has been done towards solving them, in this country at least, where the attention of surgeons has been exclusively directed to the subject of excision. I have, however, related, in my work "On the Hip Joint," a very remarkable case, which seems to prove that even spontaneous reduction may take place. The head of the femur could be felt on the dorsum ilii, and the limb was shortened by about three inches. In order to relieve the pain excited by irregular muscular action, but without any idea of reducing the dislocation, counter-extension was employed uninterruptedly for four days, and then given up from the irritation it produced. Seven weeks afterwards, while the nurse was assisting the patient to turn in bed, she felt "the bone rushing past her hand," and on the following day it was discovered that the limb was restored to within half an inch of its natural length, presenting no appearance of inversion or eversion, and quite free from pain. This case seems to place the occurrence of spontaneous reduction beyond doubt: while the excellent work of M. Humbert proves that secondary luxations of the femur on the dorsum ilii may, under certain favourable conditions, be not only reduced, but permanently cured. In one of the cases related by M. Humbert, the limb was shortened to the extent of four inches and three-quarters; in another, nearly two inches. To effect the reduction, special apparatus, somewhat similar to those employed in cases of congenital luxation, must be used, and the extension is to be effected in a gradual manner. The time required will depend on the readiness with which the displacement yields. I fear that the number of cases to which this method is applicable will be considerably restricted in practice. To afford any chance of permanent benefit, the patient's health must be in a more favourable condition than we usually find towards the close of a chronic hip disease; the head of the femur must have undergone little alteration, and the cavity of the joint must be in a much better state than experience would lead us to infer after the destruction of parts which precedes spontaneous dislocation. The cases related by M. Humbert deserve, however, more attention than they have received; for in eight of them we find that the practice adopted was followed by complete and permanent success.

In this country, as I have already observed, surgeons are more inclined to adopt the method of excision, on which I shall now offer a few remarks. Whatever opinion we may form of excision when applied to joints, the articular surfaces of which are not separated from each other, I do not think that we are justified in having recourse to it in the cases now alluded to, namely, where the head of the femur has been dislocated on the dorsum ilii, in consequence of hip disease. In the first place, the disease under which the patient, in a great majority of cases, labours, is a constitutional one; and, in the next, it is almost always impossible to remove the whole of the diseased portions of bone, without which no permanent cure from the operation can be expected. There might, perhaps, be some strong ground for extirpating the head of the bone, if the complaint were confined to this part, but if we consider the general state of a patient during the last stage of hip-joint disease, we shall be at once convinced that any danger to life which may exist arises from the general condition of the subject; and that although the local malady may, to some extent, aggravate the general symptoms, yet it is not their cause, neither will its removal prove their remedy. Besides, let us consider a few of the conditions under which it is said the operation is justifiable. The head of the bone must be displaced, and lodged on the dorsum of the ilium. But, in a great majority of cases, it will be found that the shortening of the limb does not depend on displacement of the head

of the bone—a part which, in fact, has ceased to exist—but on destruction of the head from ulceration, and a drawing up of the trochanter to a level with the brim of the acetabulum. Another condition is, that the acetabulum should be free from disease; but, I would ask, do we really possess any means of ascertaining whether the socket of the hip-joint may not be diseased, as well as the head of the femur—whether the acetabulum may not be extensively involved in the affection, ulcerated, carious, or necrosed? And if this were the case, what advantage can we expect from removing the head of the femur, when we leave other and more important parts behind untouched by the operation, though equally, if not more so, involved in the disease? You are to understand that what I have just said applies to dislocation of the head of the femur; and not to excision, when applied to the smaller joints, or in cases where the whole of the diseased bones can be removed, with some hope of the limb being tolerably useful afterwards.

The last point, gentlemen, which we have to consider, is amputation. This last resource in cases of articular disease is now more rarely necessary than it was considered some years ago, and before you think of employing so severe a measure, you must be well convinced that the only chance of saving the patient's life is to sacrifice his limb, or that the disease before you is absolutely incurable. To pass a decided opinion upon this point, much judgment and experience are required, for it is astonishing to what a degree articular disease may sometimes proceed, in young and scrofulous patients especially, without being necessarily incurable. I have seen many cases where amputation appeared to be the only resource, yet, by waiting a little, and by carefully attending to the general health, the patients have recovered with tolerably useful limbs. Before deciding on the question of amputation, you must carefully reflect on the general condition of the patient, and on the nature and degree of the lesions in the affected joint. You must have made up your mind that the local disease is incurable, and you must also have a reasonable hope that the removal of the limb will be followed by a restoration of health. With reference to this point, you will have to consider what effects the long-continued local disease may have produced on the general health and strength of the patient, but above all things you must assure yourselves that he is free from signs of pulmonary or abdominal tubercle. If these be present, amputation can only hasten death. On the other hand, patients often recover in a rapid manner, and from an apparently hopeless state, after removal of the diseased limb. But you may ask, at what period of the disease, and under what conditions of the joint, should amputation be performed? This is a difficult question to answer in a general manner. I may, however, state, that when complete disorganization of the joint is evidently going on, and cannot be arrested by the usual means,—when extensive abscesses exist around the joint, and the drain or irritation begins to tell on the patient's health,—when it is clear that the articular cartilages are more or less destroyed, the ligaments softened, the bones displaced, and when, after waiting for some time, you can perceive no tendency to ankylosis,—in all cases of this kind the propriety of having recourse to amputation is placed beyond doubt.

## OBSERVATIONS ON CHOLERA.

By M. J. RAE, M.D.,

PHYSICIAN TO THE CARLISLE DISPENSARY.

As cholera has reappeared again in various places with renewed violence, and in all probability will prove as destructive in its course during the approaching autumn as it was at the commencement of the present, or in either of the former epidemics, any measures, sanitary or medicinal, which have been known to have moderated its virulence, and have appeared to have restrained its course and development, ought to be recorded, that out of the accumulated experience of many observers more enlightened views of its nature may be obtained, and broader foundations established, upon which sounder and more successful modes of treatment may be reared.

It is not my intention, at present, to examine the many theories that have been propounded of the essential cause of cholera, but merely to make a few observations on that one of them which refers the essential cause to contagion; believing at the same time that the profession is not yet in a position to determine positively either the contagious or non-contagious nature of the disease, it will require a much greater amount of information, and more extensive and accurate observation respecting cholera than we already possess, before a definite

and really conclusive opinion can be formed on the subject. My own experience of cholera, and all that I have either read or heard respecting it, inclines me to believe in the contagious rather than in the non-contagious nature of the disease. Its mode of progression favours the supposition of its being contagious more than it does that of its being a non-contagious disease, dependent on some telluric or atmospheric influence for its development. It travels more or less slowly from town to town; overruns one country after another, taking often years to traverse a whole continent; now diverging, then retrograding, or appearing to be arrested in its course. It advances along the great lines of communication that exist between different towns and countries, along the tracts of trade, and the "highways of commerce;" and overspreads a country more or less quickly, just in proportion to the facilities of intercourse existing between its respective towns. This is the way that one would expect an infectious epidemic fever to propagate itself. How different from this is the mode in which influenza develops itself, a disease unquestionably not contagious, and depending, in all probability, on telluric or atmospheric influence? This epidemic spreads itself with the utmost rapidity, affecting different countries almost simultaneously, and bringing whole continents under its influence at nearly one and the same time. But cholera took sixteen years to travel from Hindostan to Britain in 1832; it accomplished the same journey more rapidly in 1848; and the epidemic has reached us again, after an interval of only five years; facts which militate against the idea of its atmospheric origin, and show that its progress is regulated, to a great extent, by the freedom and frequency of communication existing between the towns and countries which are the scenes of its ravages. It reached us sooner in 1853 than it did in 1832, because the facilities of intercourse between Britain and the continental countries and the East have been greatly increased within the last twenty, but more especially within the last ten, years. In fact, the rapidity of the march of the epidemic of 1853 over that of 1832 bears a strict proportion to the increased means of intercourse that have taken place during that interval between this country, the countries of the continent and the east; and were the means of intercourse between the different countries of Europe and Hindostan still freer, were the same freedom and frequency of communication to exist between them as occur between the large towns in this country, there is nothing improbable in the supposition that we should have the epidemic not after intervals of sixteen or five years, but have one epidemic following another in close succession, until the disease became endemic amongst us. Nay, for anything we know to the contrary, this may actually become the case with cholera.

Again, cholera has never been known to have reached any place sooner than the means of communication existing between it and an infected town could have conveyed the contagion. And it has often taken a far longer time to arrive at a place comparatively near to an infected town, but where slow and unfrequent means of communication existed, than it has taken to traverse extensive tracts of land and ocean intervening between towns and countries having free and rapid intercourse with an infected part.

In the first epidemic of cholera, the disease appeared in Naples—which enjoys free intercourse with Marseilles, where the epidemic existed—about twelve months before it made its appearance at Rome. It took six months to spread from Oporto to Lisbon, owing to the siege having interrupted the free communication by water between them; while it crossed the Atlantic from Europe in a few weeks. This is strongly in favour of the contagious nature of cholera. The spread of cholera in a town has some striking points of resemblance to that of a contagious epidemic, as scarlet fever for instance, which must have been remarked by every one who has seen much of both diseases.

Cholera, like scarlet fever, gradually spreads itself over a town, invades first one portion of it and then another, with greater or less rapidity, until the whole, or greater part of it, is brought under its influence. It does not sweep over a town at once, spreading simultaneously in all directions; nor does it always make its first appearance in the filthiest, lowest, and most over-crowded parts of a town, all of which one would expect it to do were it dependent on telluric or atmospheric agency. Cholera may abate in, or disappear from, a place, and then break out in it again with renewed violence during the same epidemic; and the same circumstances may be observed in scarlet fever. There may be sporadic cases of cholera before it prevails, and after it disappears, in the epidemic form; and there may be single cases of scarlatina, both before it assumes the form of an epidemic and after it has lost that character.

Again, when cholera enters a house, how seldom are its ravages confined to one member only of the family? not oftener, perhaps, than occurs in scarlet fever; but, generally, one member of a family is seized with symptoms of cholera, another, and then another is affected in succession, until all, or nearly all, the members of it become affected with the disorder. Some of them die, others escape with difficulty, while the remainder either get off with a comparatively slight diarrhoea, with cramps, or remain altogether unaffected. So, when scarlet fever invades a family, one individual of it may have the disease in all its severity, and others may have it in turn, with every modification, from the most malignant form of the disorder, down to a simple fever, with a slight sore-throat; while the other members, though equally exposed to the influence of the contagious agent, escape taking the disease.

And in cholera, as in scarlatina, the attacks amongst the members of a family generally succeed each other with more or less regularity. When one dies, or is recovering from the disease, another is attacked by it. But cholera being a more active and more rapidly fatal disease than scarlet fever, the period of incubation may be shorter in the former than in the latter; and the poison or noxious agency may be more freely and quickly generated in the one than in the other, and that consequently, the energy of the epidemic to continue itself may cease sooner in cholera than scarlet fever, just as a tree of profuse and rapid growth exhausts its vital principle or energy sooner than does one of a different species which arrives more slowly at maturity. This may account for the more rapid manner in which cholera, in comparison with scarlet fever, exhausts itself. It may also partly explain the quicker diffusion of the former over a town, and the shorter time required by it to run through a family than the latter. Cholera may spread itself over a large town in a few weeks, whereas scarlet fever may take months to bring it under its influence. The one may exhaust itself in a district in a few weeks or months, the other may linger in it for one or two years. The former may run through the members of a family in a few days, the latter may require several weeks to finish its course amongst them. Judging, then, by the mode in which cholera spreads itself over the earth; by the quickness of its progress through countries whose towns enjoy free and frequent intercourse with one another, in comparison with the great slowness of its march in countries where the opposite circumstances as to free communication obtain, but whose towns were in as bad, if not in a more defective, sanitary condition, and ought therefore, according to the atmospheric or telluric theories of the disease, to have, if not quickened, at least not to have checked, the onward progress of the epidemic; and judging further of the fact, that cholera invariably breaks out first in the frontier, and not in the central towns of a country, in seaports either nearest to the infected places or in those holding the freest communication with these parts, and not in inland and seaport towns having little or no intercourse with the infected districts, but which were just as filthy and as deficient, if not more so, in all sanitary appliances as the towns in which cholera first made its appearance, I am disposed to believe in the contagious nature of the disease, because it offers a far more reasonable explanation of the above and other circumstances concerning the progress of the epidemic than the non-contagious or atmospheric theories afford.

The above circumstances, together with the consideration of the immunity from cholera enjoyed by the inmates of public establishments isolated from infected districts, and the breaking out of the epidemic in similar establishments where no such regulations existed; the many well-authenticated and probable cases of the importation of cholera into towns and villages by parties from infected localities; its gradual diffusion over a town and through a family; its march, so different from that of influenza, and so similar in many respects to that of epidemics, known to be contagious;—such conditions as these should make us pause before we dogmatically proclaim cholera to be a non-contagious affection. It would be more prudent, and more in accordance with the spirit of true philosophy, to act upon the supposition that it is contagious until it has been proved not to be so, which I affirm has not yet been done. Nay, the evidence respecting cholera supports the opposite conclusion, that it is a contagious disease, and that it never breaks out spontaneously, or through telluric or atmospheric agency, in any town, however filthy or otherwise defective in every sanitary improvement; that the contagion must always be imported into a town from an infected part by infected parties or otherwise; and that in whatever part or parts of a town the contagious matter or principle is deposited, be these the cleanest, most airy, and healthy, or the most impure, overcrowded, and worse drained parts of it; that from these

centres or foci the disease will generally spread itself all over the town with greater or less rapidity, just in proportion to the nature of its situation, external conditions, and the state of its inhabitants; and that cholera, like scarlet fever or small-pox, if imported into a town as defective in sanitary arrangements as Newcastle was said to have been at the time the present epidemic broke out in it, will spread itself more rapidly and with greater virulence over such a place than it will do over a town superior to it in point of cleanliness and sanitary regulations. The evidence with respect to the progress of cholera favours the supposition, that impure air, defective drainage and ventilation, and the use of water contaminated with decaying vegetable and animal matters, are never the cause, if they are ever even the occasion, of the irruption of cholera into a town; that they act as predisposing causes of cholera, and in all probability in the case of this disorder as in that of other contagious epidemics, render it more deadly in character, and give more permanent and extensive bounds to its ravages, by concentrating, intensifying, and probably diffusing, the choleraic contagion. And therefore every endeavour should be made to remedy the defective sanitary condition of our towns, and every hygienic precaution adopted which might lead to the improvement of the general health of the inhabitants, and to the purification of all the probable mediums through which the choleraic poison may be conveyed into the system; so that, should cholera prevail in them, it may prove less destructive in its course and shorter in its duration.

Admitting the contagious character of cholera, it would be useless, in the present state of our knowledge respecting the disease, to attempt to point out the laws of the propagation and diffusion of the contagion, its introduction into the system, the period of its development there, and the time or manner of its elimination. It is probable that the choleraic poison generates itself in the system, becomes fully developed at a particular period of the attack, and is eliminated with greater freedom at one time than at another; and that the poison so generated and eliminated is capable of infecting some, and is innocuous to others, who may be exposed to its influence. It is also every way likely that all individuals in attendance on, or in frequent communication with, cholera patients or their dwellings are brought within the influence of the contagious elements; but that while some of them withstand its power, others succumb to its influence; and that those slight attacks of diarrhoea, with spasms, which so frequently occur during the prevalence of the epidemic, are really mild and modified forms of cholera, owing either to some peculiarities of individual constitution, or to some circumstances connected with the morbid agency itself; for these slight cases bear just as strong a resemblance to the severest forms of cholera, as do those cases of almost imperceptible febrile disturbance with a few pustules which occur in the small-pox epidemic, to the most malignant forms of that disease. And as an apparently mild and almost unheeded case of small-pox may speedily assume a most malignant and fatal aspect, so we find that an exceedingly slight attack of diarrhoea may be suddenly converted into a dreadful and rapidly fatal case of cholera. Hence the necessity of early attention to any slight irregularity of the bowels that may occur during the course of the epidemic.

(To be continued.)

## SMALL-POX OCCURRING TO THE FŒTUS IN UTERO.

MR R. AULSEBROOK, Esq., M.R.C.S.E. & L.S.A.

I AM desirous of placing upon record the following case of small-pox occurring to the fœtus in utero, which came under my observation in the year 1834, the entire particulars of which I have not been able, from circumstances, to gather together until the present time, but which, having now obtained, I venture to think will be of sufficient importance to be placed in the pages of THE LANCET.

Varicella existed in Birtton, near Aylesbury, Bucks, in November, 1833, contiguous to the residence of Jacob W—, a baker in that village. His son, who had never been vaccinated, caught the disease, as it was supposed, from the family of a neighbour, and the eruption was observed in him on Saturday, November 30th. On Sunday, December 1st, Mrs. W— and all her other children were vaccinated, for the first time, by Mr. W. Hayward, surgeon, of Aylesbury, with whom I was then resident as visiting assistant. The vaccination was successful in all, excepting one daughter, who, however, was successfully re-vaccinated by me at the end of a week. Mrs.

W— had but one vesicle; but there is now (June, 1854) a tolerable scar visible. Fourteen days before her confinement, Mrs. W— states that she remembers most distinctly on that day that a most nauseating and depressing effect was produced in her by the odour of one of the stools from her variolous son, whom she was nursing; and on the 4th of January, 1834, a fortnight from the above sensation produced in her, and five weeks, minus one day, after her vaccination, she was delivered of the child the subject of this notice. On examining the infant almost immediately after its birth, I observed on the abdomen some spots, differing in size and appearance; others were discovered on the loins and back, and on the face and neck, those on the latter parts being most numerous. At the inner angle of one of the eyes was a pustule, nearly matured, of the size of a common small-pox pustule, and others of the same size were found on the hands. On the following day the eruption was considerably more out; each pustule had a distinct red inflamed base, was depressed in the centre, and had unequivocally the true variolous character; a cluster of them existed at the left side of the tongue near the apex, and one on the dorsum of that organ towards the root.

The child was feeble, did not suck, nor take scarcely anything by the mouth, and early on the third day expired. Mrs. W— had herself no illness, nor any manifestations of the disease apart from the nausea arising from the effluvia before mentioned, which she perceived on the fourteenth day prior to her confinement, and at which time it is perhaps scarcely questionable the taint was communicated to the fœtus in the womb.

Having had the honour of an acquaintance for many years with Mr. Robert Ceely, of Aylesbury, and knowing how extensive the labours of that gentleman have been on this general subject, constituting him, indeed, by common consent, the greatest living authority upon it, I mentioned this case to him, and he has pointed my attention to two examples recorded by Dr. Jenner, in the "Medico-Chirurgical Transactions" for 1809, p. 269, in which the fœtus in utero became affected, the mother escaping any external manifestation of the disease. Dr. Jenner adduces those cases to show the continued susceptibility to variola through life; but as the cases differ as to particulars, I shall briefly state them.

In one of those cases the mother had small-pox herself many years before, but had never been vaccinated; and on meeting in the street, very shortly before her confinement, a child covered with the disease, and loathsome in appearance, she was very sensibly affected. The sensations passed off, and she had no outward manifestations of the disease; but five days after her delivery, pustules appeared on the infant, and the disease went through its usual stages, though in a mild form.

In the other case related, small-pox had been introduced into the house by the parish surgeon (1806) inoculating three of the sons of the family, but the mother was vaccinated by another surgeon. The vaccination was successful, and in five weeks after its performance (during four weeks of which time she had been exposed to the variolous infection of her three sons) she was delivered of a female child, which on its birth was found affected with the small-pox eruption. The surgeon, (Mr. Gervis, of Ashburton, Devonshire,) whose case the above was, distinctly states that at no period after the exposure of the mother to the variola in the house did she evince any sign of being affected by the effluvia; yet the disease was transmitted through her system to the constitution of the infant, herself clearly escaping any kind of manifestation.

In the case I have related, and which came under my own notice, the mother, it will be borne in mind, had been vaccinated, and successfully; but, notwithstanding, had, fourteen days prior to the birth of the child, and three weeks after her vaccination, "a most nauseating and depressing effect produced on her by the odour of one of the stools from her variolous son."

This strong perception of the variolous infection was not, however, sufficient against the protective influence of the vaccine matter which had been introduced into her system, to produce any development in her of the small-pox, and the infection passed to the fœtus in the womb.

The value of this case, in so far as it may be considered by the readers of THE LANCET to possess interest, consists, it may perhaps be said, in this, that it sets forth, at one and the same time, and in a more palpable way than any previously recorded, the continued susceptibility to variola after vaccination; and yet the protective influence of the vaccine lymph in operation, guarding the system so far in this instance as to prevent any eruption appearing, or any other than a transitory affection of the health.

Hamwell, Middlesex, August, 1854.

ON  
THE CONSTITUTION OF CHOLERAIC LIGHT,  
AND THE TRANSITS OF THE EPIGONIC  
POWER.

By WILLIAM JOHN THOMAS, Esq., M.R.C.S., Kirkdale,  
Liverpool.

I OBSERVED, in THE LANCET of the 19th inst., the announcement that Asiatic cholera is on the increase in London. In my communication, which was published on the 6th of May, I submitted to the readers of THE LANCET a series of eighteen propositions on the sanitary conditions of light. Now is the time to test in the metropolis of the world, where the elements of science converge, the truth of those propositions. I consider that a solemn duty is imposed upon every member of the profession who entertains original views on the subject of the *occult* causes of the pestilence, to lay those views before the profession. It may be said, "If the polarity of light is altered, what can we do to amend it?" This is not the proper question to propound in the infancy of our researches into the sanitary conditions of light. The practical question is this:—Is the polarity of light altered?—and how does that alteration operate upon the powers of life? When we have decided these questions, then will arise the therapeutic problem. First let us ascertain the cause of the pestilence, then we may consider the proper remedies. At present the pestilence is widely diffused. In the eastern hemisphere it ranges from 30° to 60° north latitude; in the western hemisphere from 20° to 50° north latitude. It approaches nearer to the equator in the western than in the eastern hemisphere of the globe. And what does this indicate? It appears to point out the fact, that certain alterations have taken place in the great polar elements circulating in the globe. In my former paper I ascribed the alteration to the pressure of non-polarized light in the interior of the globe, caused by certain changes in the luminous atmosphere of that grand cosmical magnet—the sun. These changes, whether they be secular or periodical, we must admit to be of primary importance. The pressure of non-polarized light would increase the velocity of the internal magnetic forces circulating in the globe.

We know, from mathematical demonstration, that if the velocity of the forces be increased, so as to be in a less proportion than as the square of two to one, the orbit becomes changed from the circle to the ellipsis. If exactly in the above mentioned proportion, the configuration assumed is that of the parabola. It would appear that the magnetic elements of the earth have been excited by the solar influence into increased rapidity of action. At the present moment, assuming one centre of operation, it would seem that a parabola of invisible magnetic light has been formed, the western vertex inclined towards the equator, the abscissa of the parabola of course participating in the equatorial inclination. Assuming this to be correct, all that portion of the parabola above the lesser ordinate defined by a segment of the earth's periphery, will come into opposition with the solar atmospheric light, and diamagnetize its most refrangible rays.

Let me entreat the indulgence of your readers whilst we trace, step by step, the resulting phenomena. The eruption of terrestrial magnetism would operate, in the first place, to deflect the violet ray from the unity of the normal luminous forces. Now, it has been ascertained by experiment, that in the violet ray resides a peculiar power, which deflects and affects the dip of the magnetic needle. The green, yellow, orange, and red rays give no indications of the possession of this remarkable power. This power to affect the needle, for the sake of brevity, I will call "the epigonic power." It is especially resident in the violet ray: the indigo and blue rays giving fainter indications of its presence. It appears, therefore, that the blue rays are the lines of demarcation of the epigonic power. It would seem that the presence of the epigonic power in light is essential to the integrity of animal and vegetable life. If then, as may be anticipated, a portion of the solar light is diamagnetized by *jets de feu*, of invisible terrestrial light, that portion must of necessity be the first in order—the most refrangible rays. If the diamagnetism and deflection of the most refrangible of the solar rays are the results of the collision with the *jets de feu*, one of the two following effects must ensue. Either the epigonic power will be peripolarized with respect to the polarity proper of the inferior rays of light—the green, yellow, orange, and red rays—the least refrangible: or, secondly, a series of transits of the epigonic power must ensue. These transits may be either progressive or retrograde, through the epipolarized rays of the solar spectrum. If the epigonic power be peripolarized, then the shock on the periphery of the nervous

centres, producing cholera, may be accounted for. In the normal conditions of light the epigonic power is a *constant* of the luminous forces. But in the abnormal condition, we have a *b-b*, and the former is impaired by the absence of the latter. According to the law of compensation, and the doctrine of the equilibrium of forces, the vital forces of animal and vegetable organisms ought to quit their respective organizations to supply the magnetic vacuum in the luminous forces. This we find to be the case; for in cholera, whether in the animal or vegetable kingdom, the organizations are broken up. Such is the external demand upon the floating and stored-up capital of the vital forces of organisms, that even the permanent capital of latent vitality, invested in the vito-crystalline lines of organic symmetry, is drawn upon; and the symmetrically organized lines of latent vitality are disrupted for the supply demanded by the extraordinary depreciation in the vital forces of light. In this respect the cholera may be viewed as a vast power capable of analyzing living organisms; acting in opposition to the laws of construction, and compelling the organized bodies to refund the electrical equivalents that bind in vital union the lines of organic systasis. Allow me, in conclusion, to suggest that, during the prevalence of Asiatic cholera in London, daily calotypes should be taken of the solar spectrum, not only through the prism in the ordinary way, but through various chromatic media: that special attention should be paid to the isolation of the violet ray, and that the action of that ray upon the magnetic needle should be made the subject of minute examination. The quantity and intensity of the epigonic force should be noted, and any variations accurately minuted. If any retrograde or progressive transits of that power are observed, either to the more luminous rays, or to the actinic, parathermic, or red rays, such transits should be accurately recorded; that the sustaining power of the magnet during the progress and crisis of the epidemic should be observed attentively; and that all variations in the formation and colouring of the spectrum should be registered. A number of valuable facts would be thus acquired, which might be made subservient to purposes of practical utility. As these observations cannot be undertaken without expenditure of funds and time, it appears to me to be the especial duty of the Government at the present moment to undertake them for the welfare of the public. If Viscount Palmerston would nominate Robert Hunt, F.R.S., to undertake the investigation, it could not be assigned to a more competent or experienced philosopher. His published works are a sufficient guarantee for the propriety of such a nomination.

Kirkdale, Liverpool, August, 1854.

## CALOMEL AND BICHLORIDE OF MERCURY IN CHOLERA.

By J. WEARNE, Esq., M.R.C.S., &c.

I HAVE been long attentively considering the present treatment of cholera as described in THE LANCET, and have been forcibly struck with the still prevalent impression in favour of the use of calomel. A vast host of medical men would rejoice, I presume, if they could induce the peculiar action of mercury *with sufficient rapidity*; but I think that when they consider how slow is the action of calomel, even when the system is less interfered with than it is in cholera—how much the desired action must be prevented by the vast outpouring of fluids from the viscera—and when they reflect further on the pertinacity with which it *has been tried*, in all doses, I can hesitate but little to ask, Whether there be not a more soluble and more active form in which mercury can be exhibited? I have seen the calomel come away in the evacuations of cholera patients in sufficient abundance to be collected in teaspoons, without benefit to any one but the manufacturing chemist. I have seen it given also, to the utter exhaustion of the patient's chance, on a system allied to that of Dr. Ayre's; but never have I seen the disease sufficiently protracted to admit of the evident existence of mercurial action; and my own impression is, that to the present day no decided merit can be ascribed to calomel.

A more active form of mercury, more soluble, more easily absorbed—I might say more antiseptic—is the bichloride of that metal. I allow that another adjective which must be employed, in giving it a true character, is that it is *dangerous*; but is it *too dangerous* to be tried, with anxious care and watching, in cholera?

I can only say that, should I again have the melancholy opportunity of treating cholera, I should consider it my duty to give this medicine a fair trial, in combination with opium,

in small and frequent doses, plentifully diluted with tepid water.

Practitioners of thirty years' standing can probably recollect—as I am sure that I can—the occurrence of cases of spasmodic cholera, treated with calomel and opium, exhibiting cold surface, blue skin, and the most awful spasm, but from which recovery was the general rule. Such cases still occur in this *ultima thule*, and I doubt not elsewhere. The voice was also suppressed in severe cases of the old spasmodic cholera; and I remember with the utmost clearness how strongly the first sight of a rice-water evacuation in 1833 enabled me to distinguish that peculiar fluid from every other that I had ever seen emanate from the human body. Would it not be well, then, that the existence of this symptom should be the indispensable title of every case to be ranked as cholera, and that such symptom should be present in every case subjected to experimental treatment?

I should also be glad to see the day arrive when the profession will be less anxious to publish infallible remedies for approaching supposed cholera. Suppositions cases might be left to the apprentices, while their masters should be devising some remedy for the real and patent dangers of the rice-water stage and its immediate antecedents.

Helston, Aug. 1854.

ON

## THE PRESERVATION OF THE HEALTH OF THE BRITISH SOLDIERS AND SAILORS, AND THAT OF OUR ALLIES.

By J. H. TUCKER, Esq.,

HONORARY SECRETARY TO THE EPIDEMIOLOGICAL SOCIETY.

At a time like the present, when our soldiers, as well as those of our allies, are, or have been, suffering from epidemic bowel complaints, cholera, dysentery, &c., I hope I may be excused for suggesting, through your journal, the use of dilute sulphuric and nitric acids, or sulphuric acid alone, as a means of prevention of cholera and dysentery.

In my paper, read before the Epidemiological Society on the 3rd of July, I alluded to these acids as prophylactics of cholera, and quoted Dr. Fergusson, who mentioned nitric acid as well as the juices of acid and sub-acid fruits, as preventive of dysentery.

It has been proved that in cider counties, where that drink is the common beverage, the inhabitants are in great degree exempt from epidemic bowel complaints; and Mr. Herapath, of Bristol, the analytical chemist, has shown that cider resembles sulphuric and nitric acids, with water, sugar, &c. — See *THE LANCET*, August 2nd, 1851.

Sir Gilbert Blane, M.D., in his work "On the Diseases of Seamen," Dr. Fergusson, and others, have spoken of the value of vinegar, both amongst patients in the navy and army, as preventive and remedial of disease, and both allude to the use of this article by the ancient Romans as a means of the preservation of the health of their armies.

Dr. Bryson, R.N., recommends quinine and wine as a means of prevention of fever, &c., but as these valuable articles cannot be rendered available, I presume, to our soldiers located where they are, and as the acids I have named can be, I hope I may not be deemed presumptuous in drawing attention to their efficacy. Dilute sulphuric and nitric acids, or sulphuric acid alone, in porter or ale, would not, I think, be objected to by our brave soldiers and those of our allies, especially when they understood the benefit to be derived from the recommendation of their medical officers.

Barners-street, August, 1854.

## SULPHATE OF BEBEERINE IN DIARRHŒA.

By WM. CLARENCE MATTHEWS, Esq., M.R.C.S.

At a time like the present, when our doors are besieged by patients labouring under severe attacks of diarrhœa, which, to say nothing of its being a premonitory symptom of that scourge, cholera, is in itself a dire malady, and will, as I can personally bear testimony, in the course of a few hours so reduce a patient as to render him almost unable to cross the room,—at a time like this it behoves us all to bring before the public anything which may occur to us as an antidote.

I am not aware that bebeerine has ever been extolled for its virtues as an astringent in this complaint. Remedies I am

aware are numerous, and tolerably efficacious, but none have I found to supersede this, and I have used it extensively both this season and last. Something, I admit, may be due to its combination, but the following I find a very near approach to a specific, and that with very few doses, as a rule; indeed, in many instances its effects are magical, for in the course of half an hour I have seen a patient restored from intolerable anguish to perfect ease:—Sulphate of bebeerine, twelve grains; sulphuric acid and rectified ether, of each twelve minims; to six ounces of cinnamon-water; make a mixture, one ounce to be taken every four hours. I generally first give a pill consisting of two grains of calomel and half a grain of opium, and if there is great pain, or the vomiting is urgent, order a sinapium to the scrobiculus cordis, then follow up with the bebeerine mixture. In almost all cases of diarrhœa which fall under my care I adopt this treatment, and in no instance has it failed.

Longsight, near Manchester, August, 1854.

## TREATMENT

OF

## CHOLERA AND DIARRHŒA

IN THE

VARIOUS HOSPITALS,\* INFIRMARIES, AND DISPENSARIES IN THE METROPOLIS.

No. III.

We are glad to say that since we closed the report inserted in the last number of this journal, the epidemic has not progressed with the gigantic strides with which it had advanced during the last four weeks; this is certainly a good sign, and we harbour the hope that a rapid decrease will soon take place. The alarm of the public mind is not of that distressing and lowering kind which is so unfavourable in trying times; the medical profession do their duty, sometimes under very painful circumstances, and the prospects are getting less gloomy.

Efforts are being made at home and abroad to improve the treatment, and new agents are being tried, with moderate success. Amongst these we should mention strychnine, which has now been extensively used in Paris, both in the form of simple alkaloid and the sulphate. It is M. Abeille who has principally extolled this remedy, which had already been used endermically at St. Petersburg, in 1832, by M. Dreyfus. Those practitioners who have followed M. Abeille's plan have not been quite so successful as the advocate of strychnine: we find, for instance, M. Hérard stating, in *L'Union Médicale* of the 26th of August, that he has tried the remedy (the sulphate of strychnine) in twenty-four cases, thus subdivided:—fourteen very severe, seven severe, and three moderately so. The dose varied according to the severity of the cases, from the fifth of a grain to half a grain; and out of the fourteen patients of the first subdivision eleven died and three recovered. In the second, two recovered and one died; and as the four remaining ones became worse with the strychnine, they were given ipecacuanha, and got well. The three patients of the last division recovered, like all those, (says M. Hérard,) whose symptoms are not severe, whichever be the means employed.

So much for strychnine. Still practitioners should not therefore maintain, or allow it to be stated, that no therapeutical agents have any effect on cholera; the main point to be kept in view is the distinction between the stages. When a patient presents all the symptoms of the last stage, our art is powerless; but we would ask, as M. Richelot justly does, in the journal above quoted, "What effect have remedies in the third stage of pneumonia?" How many patients recover with whom that stage becomes fully developed?

Sinapisms have been highly spoken of by M. Legroux, physician to the Hôtel Dieu, and his article in the *Gazette Hebdomadaire* seems to us extremely sensible. He states,—“We possess no direct action against the unknown cause of cholera; nor any remedy for this malady when fully developed. To combat the disease we have no weapons but those to be found in general therapeutics, and the treatment should therefore be based on the indications deduced from the principal phenomena, and the morbid changes which are taking place.”

M. Legroux thinks we should principally promote reaction in opposition to the algid concentration, and do so by moderate means of calefaction. We should, in the first instance, do no

\* We place the hospitals in each series from east to west.

*harm* in our treatment, recollecting that many patients recover who take nothing but cold water; and we should call back the heat of the body, not by bringing it in contact with a high temperature, but by stimulating the natural sources of animal heat. Nothing better for this purpose than sinapisms placed alternately over the trunk and extremities.

The author emits the following propositions:—1. Cholera patients can recover only by a series of organic efforts; there is no panacea for the disease in the confirmed stage. 2. Great heat is in general painful to cholera patients; when the heat to which they are exposed is continuous and exaggerated, as advised to be used by the authors of popular tracts, the patient is very likely to die. 3. Sinapisms always afford relief, and when properly used they form an essential basis of treatment. 4. Cold fluids are mostly accepted with gratitude by the sick, and act as a sedative; emetics, purgatives, and opium fulfil special indications. 5. Popular writings on cholera should be modified, revised, and brought to the level of the experience of modern times.

Leaving the Continent, and returning to the efforts made at home to diminish the mortality from cholera, we may observe that it is curious that Dr. Johnson's plan of evacuating with castor-oil (see last week's *LANCET*, page 164) should have been thought of almost at the same time by Mr. Crammey, of Middlesbro'-on-Tees, whose letter will be found in our issue of last week, page 178; nor should we pass unnoticed the suggestion of our correspondent "M.D.," who, in a letter printed at the same page with Mr. Crammey's, advises *mechanical pressure* to the *flooding bowel*. The author is probably largely engaged in midwifery practice.

### LONDON HOSPITAL.

#### CASES OF CHOLERA.

THE east districts of the metropolis (Shoreditch, Bethnal-green, Whitechapel, St. George's-in-the-East, Stepney, and Poplar,) have returned less deaths from cholera for the week ending August 19th, 1854, than the west district, (Registrar-General's Report,) the numbers being respectively 105 and 184. When we consider that the east districts have about 100,000 more inhabitants than the western, and when we recollect that the latter districts comprise the wealthy sub-divisions called Chelsea, St. George's Hanover-square, Westminster, St. Martin-in-the-Fields, and St. James's Westminster, we cannot help feeling some surprise, especially as the high-water mark is almost the same, (twenty-eight feet for the west, and twenty-six for the east.) Pleased as we must have been by Dr. James Bird's excellent paper, "On the Laws of Epidemics," (London: John Churchill, 1854,) we hardly can, with the facts just mentioned before us, read the following passage without feeling a little doubt as to the soundness of some of the opinions expressed:—"Regarding the peculiar blood-predisposition of individuals, communities, or races, which facilitate the production of epidemic cholera, nothing very definite has as yet been ascertained by minute chemical experiment, though it may be generally stated, as laid down in my pathological summary of the disease, published in 1849, that it consists 'of a diminution or altered quality of its fibrin and other normal ingredients, impairing its formative and vital power, caused by unhealthy assimilation and improper food, malarious influence, damp, ill-ventilated apartments, unhealthy exhalations from drains, and certain occult epidemic conditions of the atmosphere.'"—p. 28.

Although it is clearly proved that the present epidemic exercises its deadly influence both on the most forlorn and most exalted members of the community, probably in consequence of the "occult epidemic conditions of the atmosphere," mentioned by Dr. Bird, we would nevertheless freely subscribe to this author's advice when he says (page 31):—"Since cholera and other epidemics, then, may be potent for evil in proportion as the accessory circumstances which attend the attacks remain unchanged and unremoved, it is the duty of every wise and paternal government to prevent the market sale of improper articles of diet, or meat in a state of incipient decomposition; as well as to provide for the population houses of refuge, with a supply of good and unsalted water; to prevent dwellings for the poor being built in very damp and unhealthy localities, where they are surrounded by septic emanations from decomposing vegetable and animal matters; to improve, as much as possible, the condition of those already built, by draining, ventilation, whitewashing, and general cleanliness; and, as a wise precautionary measure, to allow of no more intercourse between the sick and persons well in health than may be necessary for their comfort, nursing, and proper medical treatment."

In fixing our attention upon the London Hospital, and keeping in view the facts to which we have above alluded regarding the eastern districts, we find that thirty-six cholera patients were admitted from the 24th of July to the 25th of August. These were placed under the different physicians of the institution, and the treatment carried out has been the same as that carried out in the epidemic of 1849—viz., the initiatory, emetic, mustard poultice to the stomach, &c. &c. Of the thirty-six patients just mentioned, nineteen have died; and on our visit to the hospital (August 25th) there were seven patients in the men's ward, but none on the female side. Four women have, however, been treated; of these two have died. One nurse employed in the receiving-room, and an occasional assistant, were attacked; of these two women, one perished of the disease. It is a singular fact that the husband of the deceased died of cholera in 1849, so that her place of abode, more than the hospital, is likely to have been concerned in the development of the disease.

In this hospital the cholera patients have been, as in other charitable institutions, placed in a distinct ward, which latter possesses over some of those which we have seen a very great advantage—viz., remarkable spaciousness. The ward occupied by these seven patients could easily contain twenty beds. It will be perceived that the proportion of deaths is larger here than in some other hospitals; this fact is, however, deceptive, for the results must mainly depend on the stage in which the patients are brought to the ward.

### ROYAL FREE HOSPITAL.

#### CASES OF CHOLERA.

THE first case of cholera treated in this hospital during the present epidemic was admitted on August 10th; and it is not a little remarkable that cases were so long in presenting themselves, seeing that in other institutions cholera patients were received as early as July 18th. The case to which we are alluding as being the first, referred to a little boy, who was taken ill in Gray's-inn-lane, and at once brought to the hospital. It appears from the data which we obtained from Mr. Curgenvin, house-surgeon to the institution, that from August 10th to August 26th, forty-two patients have been admitted suffering from Asiatic cholera. Of these only seven died, and hence we must conclude that but a small proportion were brought in the last stage of cholera. All had severe vomiting and purging, with cramps, and had suffered from diarrhoea for some days previous to their admission. We have by these facts a clear proof of the efficacy of remedies, when the disease is not allowed to reach the last stage.

At this hospital, as well as in other charitable institutions, the cholera patients have been placed in distinct wards. On our visit (August 26th) there were ten beds occupied, and it was confidently expected that most of the patients would recover. Two of these were collapsed, cold, and shrivelled, when admitted, but they are nevertheless now doing well.

The line of treatment here adopted is to give, when the patient is not too far collapsed, a scruple of calomel, followed up, six hours afterwards, by a draught of one ounce of castor oil and one ounce of tincture of rhubarb. These measures were generally followed by five or six copious evacuations, after which most of the symptoms were considerably mitigated. When the patients were much collapsed on admission, a saline powder was administered, composed of two drachms of common salt, seven grains of chlorate of potash, and a scruple of carbonate of soda. This usually caused violent sickness, and a great commotion of the whole system. The patients were subsequently allowed as much fluid as they wished to take, in the shape of barley-water, beef-tea, &c. Those who took the calomel and castor oil were given, after full operation, simple saline mixture, and some patients thus treated left the hospital in a few days, after having presented very distressing symptoms. We did not perceive that large doses of opium or brandy were administered in this hospital. It is worthy of observation that on August 11th one cholera case was admitted into the general ward, (all the others were subsequently placed in a separate room,) and on August 26th a patient of that general ward was attacked with the disease; she is now recovering.

### UNIVERSITY COLLEGE HOSPITAL.

#### CASES OF CHOLERA.

EXCEPTING Charing-cross Hospital, this is the institution in which the fewest cases have been treated. Since the beginning of the epidemic up to August 28th, only three cases of con-

firmed cholera were admitted. Of these, one patient died on August 28th; and by the kindness of Mr. Robertson, the physician's assistant, we had an opportunity of seeing the only case in the house, a man now in a fair way of recovery. The treatment adopted has principally consisted of two grains of calomel every ten minutes, with small doses of opium. This was given in the shape of a draught, with chloric ether when the cramps were very strong.

In the case which ended fatally, the patient was getting worse under the calomel treatment, and the hyposulphite of soda, which had proved useful last year towards the end of the epidemic, was tried. This salt is given for the purpose of allowing sulphurous acid being evolved in the stomach, this taking place by the contact of the salt with organic acids. To aid this process, sulphuric acid lemonade was also administered. The hyposulphite of soda was given in half-drachm doses every half-hour; but as the patient was becoming paleless, recourse was had to saline injection into the veins. The proportion of saline matter was as follows: three drachms of common salt, seven ounces of carbonate of soda, and ninety-four ounces of water. Of this fluid, seventy ounces were thrown into a brachial vein, by which measure the patient, who had been in a state of deep collapse, revived considerably; he spoke and seemed sensible, but in about five hours he again became moribund. The injection was then repeated, and forty ounces thrown up, but the patient died whilst the operation was being performed. A distinct ward was here also set aside for persons attacked with cholera, and it was noticed that no female suffering from the disease was brought to the institution.

#### ST. GEORGE'S HOSPITAL.

##### CASES OF CHOLERA.

In referring to the Registrar-General's Report for the week ending August 19th, 1854, (and those concerned deserve all praise for the very lucid and instructive manner in which it is drawn up,) we find that the west districts are being more severely visited than the north and central districts; the west presenting 184 deaths, and the north and central respectively 88 and 32, the population of the two latter being nevertheless larger than that of the former. The difference is accounted for, in the Report, by the unequal elevation above Trinity high-water mark, the north and central districts being 135 and 49 feet, and the west districts only 28 feet above the mark. Nor can the influence of the elevation be for a moment doubted, when we find 370 deaths in the south districts, which are only six feet above the high-water mark.

St. George's, situated at the extreme west, has admitted more cases than King's College and Charing-cross, and this circumstance fully coincides with the remarks made in the Registrar-General's Report respecting the cases returned in the central and western districts. In St. George's Hospital, about fifteen cases have been treated from the beginning of the epidemic to August 21st. Out of these, six have died, and on the date just mentioned there were in the house only two cases of actual cholera, as also one of choleraic diarrhoea.

In this institution the cholera patients have not been placed in separate wards, and here, as at King's College, persons admitted for other complaints have been seized with the disease after some cases had been brought from without. But it should be observed that the occupants of beds nearest to the cholera patients were not attacked. The question of contagion, we need hardly say, is still *sub judice*, but it may perhaps be said that it is safer to err on the safe side; at all events we are sorry to find that two nurses took the disease, which proved fatal to one of them. It should also be observed that several of the attendants have suffered from diarrhoea; but this is, at the present time, an affection from which very few people are free.

The treatment adopted by Dr. Bence Jones has principally been acetate of lead and opium, also tincture of capsicum, &c. Dr. Wilson has used the dilute sulphuric acid with chloric ether, and when, after five or six doses, the patients improved, they were ordered to take sulphur in combination with carbonate of soda. For frictions to the legs, when the cramps were very painful, Dr. Wilson has employed a liniment in which entered chloroform. The latter agent was also prescribed to be taken internally in an emulsion with yolk of egg. A pregnant woman, who was very severely attacked, partially recovered under this treatment; but she subsequently miscarried, and died. One of Dr. Bence Jones's patients also recovered from the original attack, but died of the consecutive fever. Dr. Nairne has mostly used the mustard emetic at first, and when a certain amount of reaction had taken place, he

gave scruple doses of calomel if the vomiting continued. When the irritability of the stomach was allayed by these large doses, two grains of calomel were taken every second hour. For pains in the stomach, the usual mixture is composed of appropriate doses of carbonate of soda, sulphate of magnesia, and antimonial wine in mint-water. Brandy and opium are not largely given here, nor is the warm bath so much used as in other institutions.

#### ST. MARY'S HOSPITAL.

##### CASES OF CHOLERA.

From the commencement of the epidemic—viz., since about the middle of July—six cases of confirmed cholera were received into this hospital. Of these, three have died, and two on the day of our visit (August 21st) were in the house. One of the latter patients was at that time recovering, and only suffering from a slight attack of bronchitis; the other, a female about twenty-five years of age, had been admitted on the same morning, and was, when we saw her, in a state of deep collapse.

In this case we had an opportunity of seeing the injection of a saline fluid into the venous system, performed by Dr. Sibson with the usual cannula and shield and the pumping apparatus. The fluid used was composed of one grain of carbonate of soda and ten of common salt to one ounce of water. About a pint of this fluid was injected, but the collapse was too deep, very little impression was produced, and the patient died soon afterwards. A separate ward has here also been set aside for persons suffering from cholera, principally on account of the alarm created in the other patients by the sight of the symptoms presented in cholera cases.

The treatment adopted in this hospital consisted principally in the adoption of such means as would allay the vomiting—viz., effervescent saline draughts, prussic acid, &c. In purging, the remedies varied, according as the matters evacuated presented acidity or alkalinity: in the first case, sulphuric acid was used, and in the second, chalk mixture. We did not perceive that calomel or opium were employed. Warm air was had recourse to in one case with apparent advantage, and patients were allowed the free use of ice. With some, both brandy and frictions were tried, but without success, as the collapse was of a decided character. No children were admitted with the disease; the females greatly predominated, and it is worthy of remark, that no cases occurred spontaneously within the walls of the hospital.

#### FARRINGTON GENERAL DISPENSARY.

No case of cholera has been reported at this institution, but diarrhoea has been very prevalent. 800 cases of diarrhoea were relieved here in the four weeks previous to the 15th of August. 200 cases occurred during the following week, none of which have terminated fatally. The patients are directed to take, every hour, a tablespoonful of a compound chalk mixture, each dose of which contains, tincture of opium, five minims; aromatic confection, six grains; prepared chalk, three grains; water, half an ounce. This is the dose for adults. Children take half the dose. The opium is omitted when the diarrhoea occurs in infants. In some cases sulphuric acid has been given, but then the patients frequently return to the dispensary complaining that the medicine does not relieve the complaint. In addition to the epidemic diarrhoea, biliary affections and various forms of dyspepsia have been unusually frequent and obstinate.

#### KENSINGTON DISPENSARY.

MR. GUZZARONI writes:—"The treatment generally adopted by me in cases of cholera consists in giving an emetic, composed of one tablespoonful of mustard and two of salt, (unless the vomiting has been previously very severe and long-continued.) After the stomach has been thoroughly cleared out, I usually give a scruple dose of calomel, which is repeated in a short time if the first dose is rejected. If the cramps are severe I order ten or fifteen drops of chloroform or chloric ether every quarter of an hour; and, with the view of checking the purging, I administer from fifteen to twenty-five drops of dilute sulphuric acid every half hour. If the sickness be very severe and protracted, I give the patient iced brandy and water, *ad libitum*, and a mixture composed of prussic acid and sesquicarbonate of soda. I likewise direct mustard cataplasms to be applied to the pit of the stomach and calves of the legs, and bottles of hot water to the feet, &c.

"I have treated altogether eight cases of cholera in the week—

house; the first occurred in a man, aged thirty years, brought into the house about three weeks since by the police in a state of collapse, and who died about seven hours after admission; the next was in an old woman, aged eighty-three, which likewise terminated fatally; the two following in old women, respectively aged seventy-six and seventy-seven, with the like result; the fifth in a man, aged twenty-four, who died about ten hours after being seized; the sixth in a woman, aged sixty-six, which terminated fatally; and the seventh in an infant, nine months, with the like result. The eighth is at present under treatment; she is a young woman, aged twenty-two; the symptoms were well-marked, and when I saw her she was in a state of collapse. I gave her a mustard emetic, and, shortly afterwards, ten grains of calomel, and three grains every half hour after, which she has persisted in up to to-day, having taken, altogether, three drachms of calomel. Under this treatment reaction has come on, but she is now suffering from secondary fever. With regard to the hiccups, which often succeed an attack of cholera, and are frequently very harassing, I find the following formula useful:—Camphor, one scruple; spirit of sulphuric ether, two drachms; sesquicarbonate of soda, one drachm; acacia mucilage, half an ounce; distilled water, six ounces. Mix. Two tablespoonfuls to be taken every three hours."

#### EASTERN DISPENSARY.

MR. JOHN BARRY writes:—"Up to this date (August 26th) no cholera has made its appearance at our institution, although diarrhoea has been on the increase in the district, and generally more obstinate in its character. The number of cases treated since my last communication, on the 18th inst., being 164.

"I have observed this fact—viz., that in places where the drainage is defective, consequently giving rise to noxious effluvia, then diarrhoea is of the most obstinate nature, for there remains the exciting cause.

"The noxious smells arising from decayed animal and vegetable matters are in some parts exceedingly offensive, and at all times a sure source of disease. It would be well if the proper authorities were to constantly see to the removal of these exciting causes, and not wait until the eleventh or twelfth hour.

"I should like the Board of Health, with Sir Benjamin Hall at its head, to make a tour of inspection through the courts and alleys of Whitechapel, not forgetting Petticoat-lane. I feel confident they would gain more experience respecting the real state of things thus, than by shutting themselves up in that very clean respectable house of theirs in Whitehall."

#### PIMLICO AND WEST LONDON GENERAL DISPENSARY.

MR. WM. GROVE GRADY, the surgeon to the above institution, has forwarded the following:—

"In contrasting the phenomena and symptoms of the present epidemic with that of 1849, I do not perceive any material difference, except as regards the type, which I do not consider so very virulent. In all the cases of cholera I have met, diarrhoea was a prominent symptom, and so exceedingly mild and unattended with pain as to throw the sufferer off his guard, and not to warn him of his danger till collapse supervenes. If the diarrhoea proceed unchecked for a few hours, vomiting succeeds it, and in a little time after this cramps and collapse follow in succession as a matter of course.

"Though I have paid particular attention to the laws which govern the disease now as well as in 1849, I have not discovered any diagnostic by which I can discriminate choleraic diarrhoea from non-choleraic, but I have looked on those cases of diarrhoea which resisted my treatment for a considerable time before they yielded to leave no doubt in my mind as to their true nature; and I have always, where the atmosphere is charged with malaria, as it is at a season like this, given the patient the benefit of the doubt, and treated the case in such a way as not to trifle with life till collapse sets me at defiance. The alvine evacuations and gastric discharges are to be looked on as most deceptive in judging of the nature of the case in the early stage, but not so when the disease is fully established; it is not to be depended on, for I have seen all the stools of the natural colour, when perhaps the very next presented the rice-coloured, with all its formidable consequences; and it is only during such time as the stools are of a natural colour that you can hope to save life; a point of great practical importance to be attended to, because I have known men not look on the case as cholera till they noticed the serous discharges, a period of great danger, for it is then that the serum and salts are passed off from the blood,

causing a fatal collapse, and which no artificial means that I am aware of can restore. It is of importance that we should lose no time in hermetically sealing up the bowels, (if you allow me the term,) and if we can do so we shall have no occasion to be puzzling ourselves about trying to cure fatal collapse. In 1849 I found all the cases admitted into the hospital were still purging, and as soon as I checked it the patients got well, and were discharged cured. As we very generally are not called till the last moment, and when perhaps another evacuation may determine the fate of our patient, it is of paramount importance that we should have at hand a remedy, and administer it at once, that will have the desired effect, and this can be accomplished by administering large doses of acetate of lead and opium; it is wasting time and loss of life giving the ordinary astringents in such cases. I have, indeed, long since discarded them from my practice, and never think of using them. Vomiting is a very embarrassing symptom; for while it lasts there is little chance of getting our remedies to rest on the stomach, and much valuable time is lost. I have invariably succeeded in removing the vomiting by administering creosote in considerable doses. In small doses this remedy is not effectual, and will fail. Against collapse we have no remedy. We should use the best means in our power to arrest the premonitory symptoms from the onset, but a patient in this formidable state should not be forsaken, for I have seen a few extraordinary recoveries quite irrespective of medicine; but I would warn those who are disposed to administer heroic doses of calomel to be cautious, for I have witnessed cases in which several hundred grains of calomel had been given, and some of the patients only recovered to tell a miserable tale, and to soon die a wretched spectacle.

"As the success of treatment in cases of cholera entirely depends on the promptness with which the medicine is administered, it should be at hand, and given the moment you visit your patient. In this way I have saved many a life. It is not my intention to enter into the minutiae of the treatment of cholera, but merely to draw attention to remedies of great practical importance and public utility, at a time when thousands are dying around us. In every case in which I have prescribed the above-mentioned medicines, I have been informed by the patient that the bowels have never been moved after the first dose, so powerfully astringent is it; but I have, for caution's sake, always continued its administration for some hours after, when I deemed it expedient, and in my hands it has never caused one unpleasant symptom."

#### PIMLICO ROYAL DISPENSARY.

MR. J. C. PIGG, the resident medical officer, writes, "That from July 26th to August 28th, nearly 1500 persons have been supplied with medicine for diarrhoea, the institution having latterly been open at all hours for that purpose. Fifteen cases of Asiatic cholera have proved fatal; in three of these, after a partial recovery from a state of collapse, they subsequently sank from the consecutive fever. With but two exceptions all had suffered from diarrhoea for a few days previous. In mild cases of diarrhoea the following are our formulæ:—

"Chalk mixture, P. L., one ounce; tincture of opium, five minims; pulverized kino, ten grains. Mix for a draught. Or, aromatic confection, ten grains; prepared chalk, ten grains; compound tragacanth powder, one scruple; tincture of opium, three minims; tincture of capsicum, five minims; compound spirits of ammonia, ten minims, peppermint-water, one ounce. Mix for a draught.

"For children: Chalk mixture, P. L. two ounces; tincture of catechu, half a drachm. Mix. One drachm to be taken three times a day.

"Dr. Ogle has ordered with considerable benefit the dilute sulphuric acid, as follows; dilute sulphuric acid, two drachms; dilute nitric acid, one drachm; adding peppermint-water to make half a pint. Mix. One ounce to be taken every four hours.

"When attended with pains, cramps, or vomiting, large mustard sinapisms have been applied to the whole abdomen. In most cases of diarrhoea the disease has in a short time succumbed to the above remedies."

#### BLOOMSBURY DISPENSARY.

MR. THOMAS CHAPLIN, the resident medical officer, gives us the following information, in addition to that which we received from him last week:—"From the 16th to the 30th of August, 1854, 129 cases of diarrhoea were admitted. They have all terminated favourably, the treatment employed being that described by Dr. Pidduck, the physician to the dispensary, in

THE LANCET of August 19th. One fatal case of cholera has occurred, the patient being a woman upwards of 80 years of age. The treatment consisted of grain doses of calomel, with two grains of rhubarb, every hour, and castor-oil. One other patient, in whom the true cholera symptoms manifested themselves, recovered under the saline treatment."

## Reviews and Notices of Books.

*Clinical Lectures on Paralysis, Diseases of the Brain, and other Affections of the Nervous System.* By R. B. TODD, M.D., F.R.S., Physician to King's College Hospital. London. Churchill. Fcp. 8vo, pp. 462.

THERE must be a fatality in the readiness with which physicians who devote much time to physiological study yield themselves up to strange vagaries of opinion on the preservation of health and on the treatment of disease. Dr. Carpenter, for instance, believes "that simple water is the best of things." Dr. Todd, we here see, is frightened at the sight of blood; and a greater man still may probably, for all we know, be brooding over "a Cilia theory." We were rather startled, some time since, in learning from a lecture published by the author of the present work, that he was in the habit of treating pneumonia with cooling drinks of Spirit of Minderus, and we now find him advocating the same do-nothing system of therapeutics in the treatment of apoplexy.

"There is a practice, unfortunately too common, but which I think is every day becoming less common—namely, that of following an attack of apoplexy by depleting measures very much as a matter of course. However applicable such a mode of treatment may be to strong, young, hale, and plethoric subjects, I presume no one will say that it is very well adapted to patients who have passed the meridian of life; whose blood and tissues are more or less contaminated by morbid matters, and with whom a morbid state of the arteries of the brain has already greatly weakened the nutrition of that organ. The case, indeed, which I have just detailed to you, is one of many which *proclaim aloud* that a depletory system ought not to be pursued indiscriminately, or even generally, in apopleptic cases."—p. 117.

The case thus referred to is that of a man who died of cerebral hæmorrhage, apparently without having received any treatment whatever. We cannot, for the life of us, see on what foundation the dead man's loud proclamation is supposed to rest. It is the rush from one extreme to the other. Dr. Todd cites in proof of his opinion against the use of depletory measures in apoplexy, 155 cases collected and published by Mr. Copeman, of which 129 were bled, and 26 were not; of the 129, 51 recovered, and of the 26, 18 survived. But Mr. Copeman's cases prove nothing, as we showed in reviewing his work some years ago; for granting, what is extremely doubtful, that all his cases were apopleptic, unless he is able to show that the 26 cases were of as severe a character as the 129, or, in other words, that the larger proportion did not recover, owing to their milder nature, the statement stands without proof. Clever people may prove anything by statistics, either in medicine or politics; and we do not doubt that Dr. Todd will be able to show by their aid the success of his own treatment. If, however, he really desires that a fair comparison should be made between the plan of depleting process in apoplexy, and the plan which we may call *flex-tomy*, the materials can easily be found in the case-books of the hospital to which he is physician, or in the cases under his own care and those under that of his colleagues.

It is true that Dr. Todd permits the use of depletory measures for apoplexy occurring in "strong, young, hale, and plethoric subjects," but how often do such persons become the subjects of this disease? He would forbid such in persons past the meridian of life, in whom cerebral hæmorrhage was owing to heart disease, or to the giving way of a cerebral artery from degeneration of its coats. No doubt many of such cases are not to be saved by bleeding, nor by any other means and

when such patients die, the disorganization produced by extensive cerebral hæmorrhage may be said to "*proclaim aloud*" against a depleting system. But are there not other cases of this kind which may be saved by a judicious use of the lancet? We believe that there are such cases, and that Dr. Todd's teaching in this most important respect is unsound, and full of danger.

Dr. Todd earnestly warns his students against the *nimidia medici diligentia*—"It is a lesson hard to learn, and more difficult to act upon, that nature can do more than the physician."—(p. 104). It is a lesson, however, of which Dr. Todd's pupils are not likely to be ignorant. In our opinion, if there be the Scylla of a too active medical interference in disease, there is also the Charybdis of a scientific *laissez faire*, which will recognise the most mysterious secrets of pathological change, but which will scarcely put forth a finger to arrest its progress.

We are compelled to differ from Dr. Todd's cerebral pathology in several instances; for example, we cannot agree with the following conclusions:—

"You will find, I think I may say invariably, that the accumulation of fluid in the ventricles, when it exceeds a certain amount, produces coma. . . . On the other hand, the increase in the sub-arachnoid fluid is not accompanied by any special symptoms," &c.—p. 56.

According to our experience, fluid seldom accumulates in the sub-arachnoid tissue without accumulating to some extent in the ventricles also; and its accumulation, either in the one or the other locality, or in both, produces coma, or does not produce it, according to the rapidity with which its effusion has taken place. The brain appears to be at least equally capable of bearing pressure without loss of function from the accumulation of fluid within its ventricles, as from a similar accumulation external to its convolutions.

We have always thought, notwithstanding the experiments of Matteucci and Raymond, and the interesting observations collected by Eckhard, that to attribute either physiological or pathological phenomena to galvanic or electrical forces is but a new-fashioned mode of refusing to plead ignorance, not less objectionable than the old one of attributing all manner of unintelligible phenomena to "vital force." We regret seeing Dr. Todd associating himself with the electricians. Thus—

"You must recollect that we treated him with galvanism, and as is usually the case where there is recent rigidity of the paralysed muscles, they were more affected by the galvanic current than those upon the sound side—a circumstance which is due, as I think, to the exalted polarity of the nerves supplying the rigid muscles"—p. 43.

Again—

"Hence the polarity was much below par, and the galvanic stimulus, which excited free action in the sound limbs, produced little or no effect on the paralyzed limbs."—p. 55.

We do not underrate the importance of such experiments as those above referred to, but up to the present moment the information we possess scarcely establishes a logical probability, far less any approach to proof, that the nervous and the electrical agencies are identical; and any theories founded upon their assumed identity must be considered as but a cloak which intellectual pride casts over the ragged reality of scientific ignorance.

Dr. Todd, as might have been expected, explains the phenomenon of epilepsy on the same galvanic principles. These, he says,—

"Depend upon a disturbed state of the nervous force in certain parts of the brain—a morbidly excited polarity. This undue exaltation of the polar force induces subsequently a state of depression or exhaustion."

On the morbid anatomy of the disease, too, our doubts are called forth:—

"This state of exhaustion is very apt to continue as one of weakened nutrition, in which the brain tissue is more or less in the condition of white softening. If the parts involved in

this be the convolutions, mental power—memory, perception—suffer; if the deeper parts, as the deeper parts of the white matter of the hemisphere, and the corpora striata and optic thalami, then we have hemiplegic paralysis.”—p. 396.

We do not believe that the author can have seen much of the morbid anatomy of epilepsy, or he would not have fallen into the grave error of stating atrophy of the brain to be a frequent coincident in the disease. A pretty extended experience has shown us that the very contrary is the truth, the nutrition of the brain being preserved in epilepsy to a very late period and in a very remarkable manner.

Of course, Dr. Todd has a perfect right, in these days of minute classifications, having seen a few cases of epilepsy with hemiplegic symptoms, to found a new variety of disease, as “Epileptic hemiplegia.” He would, however, find it very difficult, by reference to any considerable number of cases, to prove more than the occasional coexistence of the two affections.

The same may be said of his “choraic hemiplegia.” We are satisfied that we have taken no objections to Dr. Todd’s views which are not supported by fair and sufficient reasons. In taking up this his last production, we had hoped to have found far more to instruct than to challenge criticism. But we really have not found these clinical lectures either sufficiently simple for the comprehension and instruction of students, or sufficiently developed in order and argument to be deemed an acquisition by the experienced practitioner. We entertain grave doubts, too, whether the clinical teacher in our hospital schools can conscientiously discharge the duty before him if, instead of devoting his energies to the necessary instruction of his young pupils, he permits himself to enter upon “questionable disputations,” and to address, in truth, the wide circle of the profession through the more limited one of his own clinique.

*A Manual of the Practice of Medicine.* By T. H. TANNER, M.D., Licentiate of the Royal College of Physicians, Physician to the Hospital for Women, &c. &c. Second Edition, re-written and enlarged. London: H. Renshaw, 358, Strand. 1864.

MOST of our readers will remember Dr. Spillan’s “Manual of the Practice of Medicine.” It appears that this little production, although long out of print, is in constant demand; so much so, that Mr. Renshaw was induced to ask Dr. Tanner to prepare a small work on the Practice of Medicine, modelled on the same plan.

The scope and objects of Dr. Tanner’s work are thus briefly described in the preface:—

“In fulfilling my task, I have endeavoured to make the following pages the medium of as much practical information as the limited space at my disposal would allow, my aim having been to obtain brevity, not so much by omission as by a strict avoidance of all reiteration, by on all occasions saying what I mean in the fewest number of words possible, as well as by a careful selection of those points only which can aid the practitioner in the discharge of his duties at the bedside; in short, I have endeavoured to paint the features of disease, not imperfectly, but as it were in miniature.”

The task entrusted to Dr. Tanner has been exceedingly well-executed. The work, which is a foolscap octavo of 340 pages, embraces all the more important facts in medicine, clearly arranged, and tersely expressed. The practitioner or student wishing at any time to refresh his memory in the theory and practice of Medicine, may do so by means of this work at a very trifling cost of time, labour and money.

*On the Ferns of Great Britain.* Illustrated by JOHN E. SOWERBY, Esq. The Descriptions and Synonyms by CHAS. JOHNSON, Esq., Botanical Lecturer at Guy’s Hospital, London: Printed by Taylor and Francis, Red Lion-court, Fleet street.

It sometimes happens, although not so frequently as could be desired, that the same tastes and pursuits are inherited by different members of the same family. This is the case to a

remarkable extent with that of the Sowerbys, several members of which have long been favourably known to the public as laborious, successful, and withal modest, cultivators of various departments of natural science.

The tribe of ferns is unsurpassed for elegance of form and construction by any other vegetable productions, and on this account, as well as the readiness with which many species are grown in Wardian cases, they have been great favourites, not only with professed naturalists, but with most persons possessing a taste for flowers, plants, and other natural productions; so that now a collection of living ferns constitutes one of the most elegant and common of drawing-room ornaments.

Beautiful as the British examples of the fern tribe are, it appears that no good coloured representations of the different species have as yet been published. This want the beautiful work of Mr. Sowerby is intended to supply at a very moderate cost. The plates contained in the part before us are most admirably and naturally coloured.

## MORTALITY AND SICKNESS IN THE ARMIES AT MADRAS.

To the Editor of THE LANCET.

SIR,—I beg to forward for insertion in your journal a copy of the following extract from the *Fort St. George Gazette*:—

“Return showing the *Sickness, Mortality, and Invaliding, in Her Majesty’s and the Hon. East India Company’s Armies in the Presidency of Madras, from the 1st of April, 1862, to 31st of March, 1863.*”

	Average strength.	Admissions into Hospital during the year.	Deaths from ordinary causes.	Deaths from disorders.	Invalided.	Ratio per cent. of ordinary deaths to strength.	Ratio per cent. of deaths by disorders to strength.	Ratio per cent. of deaths from disorders to strength.	Ratio per cent. of invalids to strength.
Her Majesty’s Army:									
Europeans .....	4542	8226	203	101	219	4.50	2.30	6.70	4.80
Hon. E.I.Co.’s Army:									
Europeans .....	6986	8199	123	54	80	1.76	0.77	2.53	0.70
Natives .....	55709	49089	614	125	783	1.10	0.28	1.38	1.30

Assistant-General’s Office, Fort St. George, April 23, 1864.

A medical authority of much repute a few months since asserted, that a want of more inspectors during war accounted for the numerous casualties that then took place amongst Her Majesty’s troops serving in India, but, if so, why is it that during peace, when they hold the best stations, their mortality so greatly exceeds that of the Company’s European troops? Out of 4542 men, 523 died or were invalided in one year; whilst, out of 6986 of the Company’s Europeans, during the same period, the like return only gives 227 men, or, in round numbers, the casualties were about one in eight in the former, and one in thirty-one in the latter.

Trusting soon to see the Company allowed to raise all their own European battalions, or that the medical department of the Queen’s service will be placed under the authority of the Company’s superintending surgeons and medical boards, who understand the diseases of tropical climates,

I remain, Sir, your most obedient servant,  
Madras, July, 1864. A MEDICAL OFFICER.

**ROYAL ORTHOPÆDIC HOSPITAL.**—The half-yearly meeting of this institution, founded in 1836, for the cure of club foot, lateral curvature of the spine, and other contractions, was held in the hospital, Bloomsbury square. The report for this half-year, as read and agreed to, showed that the number of patients admitted during that period had been 981, being an increase over the preceding half-year of 231. Total number admitted since the opening of the hospital, 16,227.

## THE LANCET.

LONDON: SATURDAY, SEPTEMBER 2, 1854.

SINCE our former observations on the origin and constitution of the new Board of Medical Examiners to the East India Company, we have obtained additional information upon the matter, and regret to state that it is far more discreditable to all the parties concerned, and more humiliating to the profession, than we at first believed. We have now before us facts, derived from more than one official source, which must either destroy the newly-formed Board in its infancy, or entirely deprive it of all claims to efficiency, and public or professional respect.

The profession will remember our congratulations upon the promise held out by the India Bill passed in the last session of Parliament; that in future all medical appointments in the Company's Service would become the reward of merit as tested by examination, instead of being, as heretofore, gifts in the patronage of the Directors. We then stated that, promising as the scheme appeared, everything would necessarily depend upon the mode in which it was carried into operation.

The Act of Parliament provided for the appointment of a Board of Examiners, who should ascertain the qualifications of candidates for the rank of Assistant-Surgeon. When the Act came into operation, the Board of Directors applied themselves to the duty of selecting the Board for recommendation to the Government and to the President of the Board of Control, Sir CHARLES WOOD. It should be mentioned that the Directors have always kept a very particular record of the services and qualifications of every medical officer in their employment, so that they were in possession of the data upon which to make a proper selection. After due consideration, the Board of Directors decided on recommending the following gentlemen to Sir CHARLES WOOD, their names being placed in the order in which they are now printed:—Mr. J. R. MARTIN, who was the professional adviser of four Governor-Generals, who was for many years at the head of the medical profession in the East, and who held the offices of Presidency Surgeon and Surgeon to the Native Hospital, Calcutta; Dr. JACKSON, late Apothecary-General to the Bengal Presidency, Staff-Surgeon of the first class, and the medical head of the dépôt of the East India Company in this country; Dr. GOODEVE, formerly Professor of Midwifery in the Calcutta Medical College; Mr. KIRK, Medical Superintendent on the Madras Establishment; Principal of the Madras Medical College, and Secretary to the Council of General Education in India; and Mr. EBBEY, a very distinguished Surgeon of Calcutta, and Surgeon to the Bengal Eye Hospital. This list, which must be considered unexceptionable, was sent to Sir CHARLES WOOD, but that honourable Baronet thought proper to entirely set aside the recommendation of the Directors, and nominated Dr. PARKES, and Messrs. PAGET, BUSK, and HOOPER, with Dr. SCOTT as Registrar of the Board. We are assured upon good authority that Sir CHARLES WOOD committed this gross injustice and blunder at the instigation of Dr. SCOTT, the present Examining Physician to the East India Company's Service, aided and abetted by others, to whom reference was made by

the President of the Board of Control. In this way, one of the worst jobs it has ever been our duty to place on record has been concocted, and for the time carried into execution. Professional opinion in this country and in India will, we doubt not, mark its sense of the conduct of all the chief parties implicated in this affair.

There were two plans according to which the intentions of the Legislature and the spirit of the recent India Bill might have been carried into operation. The examinations and the constitution of the Board might have had reference either to the special acquirements of candidates in the subjects of ordinary medical education and examination, or to the special qualifications required in the medical officers of the Indian army and service, these qualifications having reference to military surgery and the study and treatment of tropical disease. The Board of Directors took the latter view, and selected a board of gentlemen of the highest standing and character in the Indian service. We are bound to say that we think the Directors were right, and that their selection was at once a just recognition of the claims of the medical officers who have acquired distinction in the Company's service, and of the qualifications which should properly be tested by an Indian Medical Examining Board.

Sir CHARLES WOOD and his advisers must have held a different opinion. They have evidently considered that examination in the ordinary subjects of medical education would be the best test of fitness for the Indian appointments. Accordingly, the programme of the examinations set forth nothing but the usual subjects of the different examining boards. But has Sir CHARLES WOOD taken the best means of carrying out this view? We believe the profession will consider that if he had ignored the claims of Indian military practitioners, a point on which we have already expressed a strong opinion, he was bound to take the very best men from the various examining boards of this metropolis. This should have been done if the object had been to raise the qualification of knowledge still higher than that now given for licences and degrees in this country. We see that all candidates are required to be members of some College of Surgeons; or to possess a degree of some University in which an examination in surgery is imperative. Now it is something approaching to farce, that men who have already taken the Fellowship of the College of Surgeons; or the degree of Doctor of Medicine in the University of London, should have to go before Dr. PARKES, and Messrs. PAGET, BUSK, HOOPER, and SCOTT, to be examined on the very same subjects as those which have preceded their Fellowship or M.D. before the distinguished Examiners of these institutions.

We contend that the provisions of an Act of Parliament, which might have proved of the highest value, have been made the foundation of a gross job. The appointments made are a great injury to the Indian Medical Service at large, and especially to those whose distinction might have entitled them to honourable employment, as well as to the candidates who might have expected an examination at the hands of a Board whose examinations should confer honour on all those passing its ordeal with success. This job has been perpetrated during the recess, or its authors would already have been called to account within the walls of Parliament. Before the next session the indignation of the Indian Medical Service will have made itself felt, and the Minister who has been imposed upon will have to.

render some public account of the grounds upon which the Board recently announced to the profession has been selected. We need hardly say we shall return to this subject. A more disreputable transaction has seldom happened. The *medical* offenders in this case must be made known to the profession.

It is probable that the worst evils to which the profession of Medicine is exposed have their origin in the attributes which tend most to adorn and ennoble it. The bitterest enemies to our calling have never dared to attack us upon the score of our humanity, or of the unpaid services which we render to the community. Ever ready to respond to the call of the suffering and distressed, the practitioners of Medicine in this country have earned for themselves a reputation for benevolence to which the followers of no other calling can justly make the slightest pretension. Never, we fervently hope, may we lose this honourable distinction. But it is not an unmixed good. Unfortunately our readiness upon all occasions to exert ourselves in the cause of humanity has been made the means of inflicting upon the great mass of the working members of the profession the most unjust and intolerable injury. The poor and the needy have a right to look to us in the hour of their tribulation and their sorrow for that relief and comfort which it is in the power of none else to administer. Hence arose the system of gratuitous advice. Hence arose, through the length and breadth of the land, the hospitals and dispensaries which confer such signal services upon the great mass of the poor. In no country in the civilized world is so much unpaid-for service rendered to those requiring it, as by the medical practitioners of this kingdom. Most desirable, then, is it, not so much for the interests of those who give as for those who receive, that such noble and disinterested charity should not be abused. Especially is this to be desired, not only on the ground that no really deserving and destitute person should be left without medical aid at any moment that he may require it, but that they who comprise the great mass of the profession, struggling often for existence, should not be robbed of their fair and legitimate reward. Ostentatious, but self-interested, acts of "charity," upon the part of "physicians and surgeons," we regret to say (but the truth must be spoken) are exercised at the expense of those who have been denominated the "subordinates" amongst us. The readiness with which the *opinion* of a "physician or surgeon" can be obtained gratuitously, by those well able to afford moderate payment for medical advice, we unhesitatingly declare, so far at least as large towns are concerned, has been one of the most fertile sources of degradation and poverty to which the surgeon in general practice has been exposed. What is the remedy for such an abuse? We feel heart-sick at referring to the "labours" of "committees" upon this subject. The committee under the auspices of the metropolitan *clique* of the Provincial Association have done nothing! Unfortunately some of its members are too deeply interested in carrying on the abuse to effect even the slightest amelioration of so direful and ruinous a system. Gladly then do we place before our readers the Report of the Colchester Committee.

#### "GRATUITOUS PRACTICE IN COLCHESTER.

##### REPORT.

THE Committee appointed at the anniversary meeting of the Colchester Medical Society 'To consider the subject of gratuitous practice in Colchester, and report thereon at the next meeting,' in accordance with the terms of their appointment, report,—

That they have met, and have directed their attention and inquiries to the important matter referred to them.

It appears to your Committee that the subject may reasonably be viewed under two heads—viz., the system of gratuitous advice, which is given too indiscriminately at our public institutions, as the Hospital and the Idiot Asylum; and, secondly, that system of private gratuitous practice, which seems to have been carried to an extent not altogether required by the supposed necessitous circumstances of the individuals receiving it.

Your Committee beg to submit for your approval a series of resolutions to which they have agreed, and in so doing respectfully remark that the subject appears to be surrounded with some difficulties, but at the same time your Committee do not doubt that if the profession proves true to itself individually, and will in all cases act with that sense of duty which is due to the general body, that conduct so shaped will ultimately tend to check that indiscriminate system of gratuitous advice which is now prejudicing the common interests of the profession. And your Committee further believe that such a course will prove highly advantageous to the profession, by inducing amongst its members a more friendly feeling.

##### RESOLUTIONS.

1. That gratuitous advice and medical attendance are given too indiscriminately in Colchester.
2. That such indiscriminate gratuitous practice leads to injurious consequences to the profession.
3. That your Committee have every reason to believe that such indiscriminate practice may be made a means of obtaining patients in respectable circumstances, who would otherwise remain with their usual attendants.
4. That inasmuch as the so-called "gratis attendance" is carried on to an unjustifiable extent, and sometimes (it is feared) for the purpose of individual notoriety and benefit, to the injury of the profession, your Committee cannot but express their strongest reprobation of a system that ceases to be philanthropic where so perverted.
5. That your committee cannot avoid bringing before this Society the erroneous principle of gratuitous attendance at public institutions.
6. That the notice of your Committee has been called to the fact that a large number of the hospital patients, and particularly of the out-patients, are of a class who are able to pay for medical and surgical aid, and that it invites the Society to call the attention of the Committee of that institution, through the 'hospital staff,' to the subject. And,
7. That your Committee has directed its attention to the fact that a large number of the hospital patients, and particularly of the out-patients, are of a class who are able to pay for medical and surgical aid, and that it invites the Society to call the attention of the Committee of that institution, through the 'hospital staff,' to the subject. And,

(Signed) E. WILLIAMS, M.D.  
GEORGE B. CLARK, Surgeon.  
P. M. DUNCAN, M.B. Lond.  
WILLIAM WAYLEN.  
D. PHILBRICK MORRIS.  
SAMUEL A. PHILBRICK, Sec."

Is there a single town in Great Britain which cannot justly echo the truthful sentiments so forcibly enunciated by our brethren in Colchester? We believe not. Is it not possible that we can unite in a cause which interests nineteen-twentieths of the profession, and that majority, too, the real workers amongst us? We believe it is, and in no way can this be more effectually carried out than by stigmatizing as the common enemy, the man, whatever his position, who makes indiscriminate gratuitous medical advice the stepping-stone to his own advancement at the expense of his brethren.

THE town of Morpeth is blessed or cursed, according as the matter is judged by official partiality or by the experience of the ratepayers, with a Board of Health. This Board it appears has zealously adopted the little tubular drainage pipes so strongly recommended by the late authorities at Gwyder House, and the efficacy of which was so strikingly illustrated at Croy-

don. The most certain means of carrying off the soil from houses, if we may be allowed to draw our conclusions from the *practice* of the Board, which we presume is based upon their theory, is this:—lay down a little pipe, say a four-inch, but be careful not to exceed that dimension, for a main-drain; let seven smaller pipes, communicating with as many houses, empty their contents—that is, if the contents will flow—into this main-drain, and the result will be, that the system of sewerage is perfect, according to the Morpeth Board of Health. It may be, and indeed probably will happen, that the little pipes will get choked up, and that the houses will become very unpleasant from the regurgitation of fecal matter and effluvia. But then that ought not to happen, and if it does, it is the fault of the inhabitants and not of the Board of Health, whose system is constructed upon the most scientific principles. But somehow these little pipes *will* get choked up, the soil conveyed a little way into them from the water-closets dries, hardens, and the result is an obstruction. It appears that Mr. O'CONNOR, a surgeon in the town, not appreciating as he ought the admirable system of the Board of Health, and finding that the health-pipe designed to carry off the sewage from his house into the four-inch main was completely obstructed, hit upon the simple but unscientific expedient of flushing it. Now, flushing, it would seem, is no part of the system of the Morpeth Board of Health. So grave an offence called for exemplary punishment. Mr. O'CONNOR was cited before the magistrates to answer for his treasonable conduct. The magistrates, not taking the same view of the enormity of Mr. O'CONNOR's crime as the Board of Health, acquitted him. But they with, as we think, some inconsistency, refused to order him his costs. But although the magistrates had thus decided that it was not a "wilful waste of water" to flush the little tubes of the Board of Health, in order to keep them clear, it was not to be expected that the Board, which is more enlightened, and which has a system, should be convinced. Mr. O'CONNOR has therefore been served with a notice, which is so admirable an illustration of the views entertained by the Morpeth Board, as to the uses of water, and the absurd prejudice every Englishman cherishes, that his house is his castle, that we are induced to publish it.

"Morpeth Local Board of Health.

"To MAURICE JAMES O'CONNOR, Esq.

"Notice is hereby given to you not wilfully or negligently to waste, or cause to be wasted, or unlawfully to flush, draw off, or take any water from the Water Works belonging to the said Local Board; and notice is hereby given to you at all reasonable hours to permit DAVID GIBSON, who is duly authorized by us in that behalf, to inspect the works upon your premises for the supply of water.

"Dated this sixteenth day of June, 1854.

"(Received the 2nd of August, M. J. O'C.)

"(Signed)

WM. TROTTER.

THOS. JOBLING.

ANTHONY CHARLTON.

JOS. SHEW.

FRANCIS R. GREY.

"W. WOODMAN, Clerk."

From this document we gather that the conviction of the Hon. and Rev. FRANCIS R. GREY and his colleagues, that flushing water-closets is a sinful waste of water, is so strong, that they think the sanctity of private dwellings ought to be violated in order to guard against so shocking a crime.

But we suspect the Morpeth Board will have to encounter a somewhat obstinate and perverse opposition to their new system of "privy espionage." People will hardly submit

quietly to have an inspector at their elbows to put down the water-closet handle, when it shall seem to the said inspector that enough water has been allowed to flow. We doubt very much whether *any* time will appear "reasonable" to indulge the agent of the Board of Health in the gratification of such an inquisitorial and indecent curiosity. If the Board persist in such a course, it must alter its title. A Board that is bent on obstructing drain-pipes, and preventing the escape of sewage, cannot, with any propriety, be called a Board of Health. The Board of Filth would be a more appropriate appellation.

There is something so supremely ridiculous in the proceedings we have referred to, that it is impossible to treat them in a serious tone. But it is not a light matter that an estimable member of society should be subjected to annoyance, expense, and persecution, because he chooses to criticise in a spirit of freedom the principles and conduct of a public board. This is the disgraceful aspect of the case. It argues little for the wisdom of the Board, or the accuracy of the principles of the sanitary contrivances it has adopted, that it should be so sensitive to criticism, and so prone to defend its policy by appeals to law and the violation of constitutional rights.

## Correspondence.

"Audi alteram partem."

### NECESSITY OF LECTURES ON MILITARY SURGERY.

To the Editor of THE LANCET.

SIR,—I am indebted to Mr. Beveridge, of the navy, formerly a pupil of the class of military surgery in our University, and now serving in the Black Sea fleet, for the enclosed memorandum of a somewhat novel mode of bloodletting practised by the Circassians.

This was transmitted to me a few days ago, along with a very instructive case of conservative surgery, in which a forearm of considerable utility was preserved, after a wound in which the radius was broken, and the whole of the ulna, with the exception of a fragment at its upper and lower ends, was shot away.

Notwithstanding the numerous and convincing articles which have appeared in your own and in other journals, on the expediency of instituting additional chairs of military surgery, I hear of no effort making to establish, under the patronage of the Government, such a chair in your metropolis. You are aware that a sum of money has been voted by Parliament more than sufficient to endow two additional chairs of military surgery on the same moderate scale on which I have, with infinite pleasure and with some success, conducted the duties of the chair of military surgery in the University of Edinburgh for upwards of thirty years past. I will not believe that the public is indifferent to such a measure, were it even more remotely connected with the health of its fleets and its armies; and a heavy responsibility rests upon those who, with means at their command, are allowing the experience of another war to pass over our heads without a more adequate provision to treasure up its results for the instruction of those who are to come after us.

Is there such a lack of professional zeal that no man will step forward, under the present interesting circumstances, to claim his share of the Parliamentary grant? to supply what the late Baron Larrey termed a "*lacune*" in the arrangements of the Parisian school? to teach this popular branch of medicine? and to receive, to record, and to make known the experience of our army and navy surgeons now serving in the Baltic and on the confines of the Black Sea—perhaps at this moment in the Crimea—fields in a great measure new to British enterprise and professional experience?

My friends, Mr. Tuffnell, of Dublin, and Dr. Mackenzie, of Edinburgh, are present with the army in Turkey, no doubt enriching themselves with important materials for their respective courses of lectures, and, as opportunities offer, with drawings and preparations. I, who am now too old to be equal to a similar employment of my time, must be content

receive from my old pupils communications similar to that which has given occasion to this letter. Of this I have ample promise, and feel confident that I shall not be disappointed. I have never rested the expediency of additional lectureships on military surgery on what has been done, but on what has been *lost*; and every year convinces me more and more, from personal experience, that "much tangible and available information is elicited by incidental observations in the course lecturing, and that numerous important communications, both verbal and written, are voluntarily given to a professor, which would never be called forth by authority. It is in this way that the experience of the existing generation of army and navy surgeons will be most advantageously handed down to their successors in office; and it is the loss annually sustained by the profession and the public, from the want of additional establishments of this kind, which I deeply deplore."

I am, Sir, your very obedient servant,  
Altamont, Perthshire, Aug. 1864. GEORGE BAILLINGALL.

"*Novel Mode of Venesection.*—On the 19th inst., at Ghelinkjek, a Circassian was observed to be bled in the following manner: he applied a handkerchief tight round his neck till the veins of his forehead became turgid, when his comrade made several punctures with a sharp instrument. The bleeding was stopped by removing the handkerchief from the neck and tying it round the forehead over the orifices. On inquiry, it appeared that he was suffering from headache.

"I learn that the Circassians are much subject to rheumatic arthritis, possibly from night exposure while asleep on the ground, (their wandering habits being proverbial,) and have seen several cases of obstinate cutaneous affections; they are not liable to fever or ague, as those belonging to the squadron employed on their coast have been."

## THE OPERATION OF TRACHEOTOMY.

To the Editor of THE LANCET.

SIR,—The operation for opening the trachea proposed by "Delta" in the last number of THE LANCET, is precisely that so recently recommended by Dr. Marshall Hall. Sir Charles Bell, who was the first to perform the operation, with the view of applying the nitrate of silver to ulcerations of the larynx, as suggested by me, was in the habit of using the scalpel. He made his incision with the blade of that instrument, and then dilated the wound by introducing the handle.

I prefer Dr. Marshall Hall's operation—firstly, because it is more simple and more easily performed; secondly, because it is attended with less effusion of blood; and thirdly, because the dilatation may be effected with his scissors to any required extent.

I am, Sir, yours very respectfully,

J. BEDDINGFIELD.

Longville-house, Needham-market, Suffolk, Aug. 1864.

## CHOLERA IN NAPLES.

To the Editor of THE LANCET.

SIR,—The cholera continues its ravages in Naples and its vicinity. The daily returns now give the deaths at about 200, exclusive of military convicts and those private cases of the higher class who wish to be buried separately in the new "Campo Santo." Their deaths are generally returned as from typhus. The masses are thrown into large pits dug in the old burying-ground. Of the English visitors and residents ten have already died—one under peculiarly disagreeable circumstances. Captain Jones, of a regiment now quartered at Sorfù, cruising in his yacht, was seized with the epidemic at Castellammann, and died after a few hours. The municipal authorities of Castellammann refused permission to take his remains into Naples to be buried in the English burying-ground; being a Protestant, neither was he allowed burial in the Castellammann Campo Santo; so they buried him in the sandbank (by the sea-side) which forms the embankment of the railway. Amongst the military the disease has been particularly fatal; as many as 100 of the garrison have died daily, and three general officers. In Palermo the disease has appeared, and the popular excitement has been raised to such a pitch there by reports of "poisoning the wells," that it has been found necessary to put the town in a state of siege.

I am, Sir, your obedient servant,

Chinje, Naples, Aug. 1864.

ROBERT WHYTE, M.D. Edin.

## THE CHOLERA.

OUR comments of last week were intended to show that, although in this country in by far the majority of cases of cholera the invasion of the disease is gradual, yet that in a few instances here, and more frequently in hot countries, its outbreak is sudden, and not marked by prodromata of the ordinary character.\* To assert that *all* adduced examples of sudden invasion could be shown to have been ones of the ordinary kind, if properly investigated, because some have been so, would be as false in logic as we believe it to be in fact. They might or might not, by further inquiry, be settled; but if such further inquiry is impossible, we must rest satisfied with such evidence as we are provided with, and infer the truth accordingly. Now, to our minds, there is sufficient warranty for believing that cholera may invade the system at once and suddenly. But, even if that view be adopted which would maintain there is no sudden outbreak of diarrhoea, spasms, and vomiting, without some prodromata and prodromata, of whatever kind they may be, *practically* the result must be admitted to be identical; for while allowing, in the majority of cases, that the patient has marked and evident diarrhoea for some hours, or even days, which is a great many cases is so bad as to be subjected to treatment, or, if not, yet well known to exist both by the patient and his friends, nevertheless there occur instances in which a person dies of cholera who not only never came under treatment for premonitory diarrhoea, but who affirmed that nothing was the matter with him before the perfect development of the disease, and of whom, moreover, his friends, with ample opportunity for observation, had no suspicions. If in such cases as these, then, it still be maintained there existed diarrhoea, &c., or other known prodromata, we would reply—first, their existence is not proved; and, secondly, if they did exist, they were denied, or thought nothing of, either by the soon dead person or his acquaintances. Practically, then, there would be no difference. "A trumpeter of the 51st Regiment blew the trumpet for the officers' dinner so strong and so correctly as to be the subject of remark, and yet only a few minutes after he was seized with cholera, and died before the officers' dinner was over." This case has been more than once brought forward as a proof of the suddenness (without diarrhoeal prodromata) and rapid fatality of cholera. A strenuous advocate of views opposed to our own observes upon it, that he had the authority of Mr. Mout, surgeon of the 9th Regiment of foot, to say that he remarked how strong and correct this man sounded his trumpet, and that an hour or an hour and a half after he saw the man in collapse, but that he also had his authority to mention that he did not inquire whether this man had or had not a diarrhoea previous to the attack of spasms, &c. But, after all, what is really shown by this case? It is *negative* in evidence as regards the premonitory diarrhoea; of course no one

\* In addition to our previous extracts from the "Weekly Returns," we add the following from last two weeks' reports:—

"6, Vittoria-cottages, South Lambeth, on 19th of August, the daughter of a lamp-lighter, aged sixteen years, malignant cholera, collapse, (11½ hours.)" Dr. Ayres, the medical attendant, says:—"In this case there was no premonitory diarrhoea; the attack commenced with copious vomiting, and the patient was already (as far as I can ascertain by the most careful inquiry) in commencing collapse when the first purged motion occurred. The bowels had been moved *only once* on the preceding day."

"At South Villa, Oval, 13th of August, the widow of a physician, aged fifty-five years, malignant cholera, (12 hours.)" Mr. Wright, the medical attendant, adds on his certificate:—"No premonitory diarrhoea."

"At 161A, Strand, on 14th of August, the son of a government clerk, aged sixteen years, cholera, (24 hours.)" The informant states, that no diarrhoea preceded the attack.

"At 2, Portland-street, Wandsworth-road, on 21st of August, the son of a coach-painter, aged three years, Asiatic cholera, (9 hours.)" The medical certificate says, "Premonitory diarrhoea none."

"At 53, Brompton-street, Caledonian-road, on 20th of August, a silversmith, aged forty-four years, Asiatic cholera, (17 hours.)" He was seized suddenly whilst at his workshop, went home as soon as possible, and died the following day.

"At 10, Princes-terrace, Caledonian-road, on 21st of August, a (celebrated) cricketer, aged sixty-two years, epidemic cholera, (18 hours.)" He had no premonitory symptoms. He was attacked at two o'clock A.M. on the day of his death. He had been bowling at a match at Canterbury during the previous week.

"At 59, Queen's-road, on 22nd of August, the son of a carpenter, (deceased) aged five years, cholera maligna, (34 hours.)" In these two cases of father and son there was no premonitory diarrhoea; both went to bed about ten o'clock at night as well as usual, and were seized about two in the morning. The father had two motions before sickness came on, the child none, but was attacked with incessant vomiting; when that was stopped purging came on; at nine in the morning both were in collapse, although the child at that time and throughout was not much purged. They died as if poisoned. This statement is from the surgeon's remarks."

could affirm it really existed. But it is *positive* in this, that a man was considered by others to be well, was at duty, did that duty so perfectly as to excite comment, (a duty, it should be remarked, connected with *strength and correct mastership of voice*), was very ill (as to be known to be so) a few minutes after, and died before the dinner was over to announce which he blew the trumpet! There is no denying these facts, and these are the only *certain* ones about the matter. It may be true that there "is no proof in reality he was not labouring under a diarrhoea—perhaps for some days or some weeks; but we would ask—Where is the proof that he was? One of the first steps to a preparation for a sounder and more eclectic revision of the phenomena of cholera will be the desire, on the one hand, to embrace a knowledge of facts happening beyond the sphere of one's own personal and limited range of observation; and, on the other, the intention to consider and discuss them as free from flippancy and dogmatism as is possible.

We do not mean that the latter necessity is made evident by any remarks which have fallen from the writer we have just quoted from. It has been forcibly revived, however, by the perusal of a pamphlet now before us,\* and which we regret to say is not alone in betraying those characteristics we deem it proper, in our editorial duties, to express our regret at. Dr. Tucker informs us that his position as the medical superintendent of a dispensary gave him "an opportunity of observing the effects of the saline treatment of cholera, which, under Divine Providence, were marked with such signal success as to call forth an expression of thanks from the governors of the institution, and the testimonial of a public meeting specially convened in October, 1849."—p. 4.

Dr. Tucker, having blown his own trumpet in this manner, next "ventures to endeavour to counteract the evil and erroneous impression that 'confirmed cholera is incurable,' and to re-establish public confidence by the circulation of the comparatively consoling fact that, under proper treatment, cholera is less fatal than typhus fever or the malignant scarlatina." (p. 4.) Having shown us how Drs. Watson, Graves, and others treated their patients, and also that "the fatal result of this unsound system of medical practice was the 'booking' of their patients for the ocean of eternity," (p. 11,) and afterwards having admired "the scientific views and the striking facts which are exhibited by Dr. Stevens in his recent publication," (p. 14,) the author proceeds seriously to work, the result of his labours being represented in the following *resumé*:—"Facts and fair experiments prove that the deadly poison, or the proximate cause of the new pestilence, causes death by its destructive action on the vital electricity—that is, the life of the blood in the material bodies of human beings; and, from what I have seen myself, I believe that the saline plan of treatment of cholera, or the use of the vital electricity that is contained in saline matter, is not only a great improvement in the practice of medicine, but a certain specific in the new pestilence." (p. 49.) We are reminded, however, by the second edition of another tract just laid upon our table,† that Dr. Tucker's "certain specific" has to wage war with another, which has an advantage his has not had, that of being introduced to our notice by more calm and sensible writing:—"Should it be proved, as I anticipate, that sulphur is an antidote to the cholera poison, it is not unlikely that the same remedy may be available for other epidemic diseases."—p. 15.

We wish we could join Mr. Grove in such anticipation. Whilst he finds safety in sulphur, and Dr. Tucker in "the vital electricity that is contained in saline matter," Mr. J. H. Tucker‡ cries *eureka* in respect to cider and sulphuric and other acids. We can recommend the perusal of his essay as giving "a bird's-eye view" of the "acid plan" in the treatment of several intestinal disorders. We have also received the "Notification of the Central Board of Health of Jamaica," a sensible and well drawn up code, and which has been ordered to be reprinted by the Secretary of State for the Colonial Department. The members of the "Central Board" "declare it to be their decided belief that the presence of the prevailing epidemic in Kingston cannot be traced to recent importation, nor to direct communication through human intercourse," (p. 4;) that "this disease is rather one of place than of person," (p. 4;) and also that "it is an admitted fact in the history of cholera, that the establishment of hospitals for the reception and treatment of the sick has been, on the whole, unsatisfactory." (p. 11.)

Relative to the progress of cholera in the metropolis, we condense the following from the "Weekly Return" of the Registrar-General for the week ending August 26th:—

Districts.	Elevation above watermark.	Population (1851).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	53
Central (St. Giles, &c.).....	49 "	393,256	36
Western (Kensington, &c.)	28 "	376,427	179
Eastern (Shoreditch, &c.)...	26 "	485,522	119
Southern (St. Saviour's, Lambeth, &c.) }	6 "	616,635	460
			847

In the corresponding week of 1849, cholera carried off 1272 persons. In the present summer, its weekly progress is traced in the following numbers: 5, 26, 133, 399, 644, 729, and 847. In the first seven weeks of the epidemic of 1849, the deaths were—9, 22, 42, 49, 124, 152, 339. In that year it commenced about the end of May, the healthiest part of the year; it began six weeks earlier than the present epidemic, and its progress was slower; but in the fourth week of August, as has been shown, it had reached a higher rate of mortality than the disease which now prevails has yet attained. 2783 persons have already died of cholera; and 1706 of the number have fallen on the low grounds of London, out of 596,119 people whose dwellings are not ten feet above the Thames; 705 have died out of 645,819 on the higher ground, extending from ten to forty feet above the same level; and only 345 out of the 1,070,372 who live on the ground that has an elevation extending from forty to 350 feet. The mortality from cholera to 100,000 living at the three elevations is 287 at the lowest, 169 at the middle, and 32 at the highest region.

Mr. Vaughan, the summoning-officer of St. Matthew's, Bethnal-green, has forwarded information to Mr. Baker, the coroner for East Middlesex, relative to the deaths of two children, in Pleasant-place, North-street, Waterloo Town, who died from malignant cholera. The inquiry has been called for by the ratepayers, in consequence of the nuisances in the neighbourhood, where the epidemic is making rapid progress amongst the poor. There were other persons in the same house lying ill from diarrhoea and the usual symptoms of cholera.

The following letter has been addressed from Limehouse to the secretary of the Government Board of Health:—

"May we request the favour of your calling attention to the abominable nuisance we suffer in this parish from the discharge of gas refuse through the common sewer into Limekin Docks, more than sufficient to cause cholera and disease in this poor and thickly-populated neighbourhood.

"At this moment the stench is unbearable, and is supposed to arise from some communication existing from the gas works on Bow-common with the common sewer.

"We have frequently called the attention of the authorities to this subject, and it has ceased for a time. It is, however, now in force stronger than ever, and unless some immediate steps are taken, the worst consequences may be apprehended.

"We have had nearly 160 men and boys who work close to the docks more or less severely attacked during the last three weeks."

A correspondent also writes:—"I reside at Battersea, supplied by the Lambeth and Vauxhall Water Company. From Friday last to Monday I had no supply. We have the cholera raging in our parish, and three persons died from typhus fever not fifty yards from my house. With a family of children who require a quantity of water on Saturday night, it is invariably our lot to be without water on Sundays, and we have to send to the parish pump for a supply."

We are sorry to announce the death of Major-General Bush, which took place, from the prevailing epidemic, at his residence in Sloane-street, on Sunday evening. General Bush was at the head of the London Recruiting District, and was promoted to the rank of Major-General in the last Brevet.

A letter has been received within the last few days, by a gentleman in Waterford, from Captain Grant, late superintendent there of military pensioners, announcing the death, at Varna, by cholera, of Captain Dubordien, late sub-inspector of constabulary at Tremore. This melancholy event occurred the day after the lamented gentleman's arrival at that place.

Lillywhite, the well-known cricketer, has also fallen before the disease.

The reports from the northern districts of Ireland are happily more cheering. In Belfast the pestilence has not increased, and the medical men there have come to the con-

clusion that the type of the disease is less malignant than that of former years. A local paper (the *Chronicle*) thus reports:—"We have been rather surprised to see a statement in one of our local contemporaries that the deaths from cholera have been sixty per cent. of the cases. Those who have taken the trouble to investigate the matter will have perceived that, instead of sixty, there were not more than sixteen per cent. deaths of *bond fide* cholera cases. There is, no doubt, much cholera in town; but that is no reason why we should rank every serious disease which ends fatally under that head. There really has been little or no increase in proportion to the population. From twelve o'clock (midnight) on Sunday to nine o'clock last night there were eleven new cases of cholera and two of diarrhoea, with but one death. We still agree with Dr. M'Gee, that the disease is of a milder type than usual, or the deaths would bear a much more signal proportion. There is not a single case in Hollywood, so far as has yet been known, although there has been a keen eye for detection of the premonitory symptoms. On Thursday the official returns will exhibit the disease from its commencement this year."

The *Gazette des Hôpitaux*, of the 19th, publishes the following strange story:—Dr. Roger (de l'Ore) having been called upon to visit a patient in the worst stage of cholera, prescribed, but with scarcely the slightest hope that it would be efficacious, an emetic of one and a half grammes of ipecacuanha, to be taken in three doses, (*prises*), at intervals of half an hour. The person who was charged to administer the ipecacuanha, seeing the word *prises*, and finding that the medicine was a powder, imagined that it was a kind of snuff, and that the three *prises* meant three pinches. He consequently made the patient sniff up a third. The ipecacuanha thus administered, instead of making the patient vomit, caused him to sneeze with such force, and for so long a time, that a violent reaction took place. Heat returned to the surface, all the symptoms of cholera ceased, and when the physician paid his next visit he found the patient cured.

## THE WAR.

(FROM OUR SPECIAL CORRESPONDENT.)

MONASTIR, AUG. 7TH, 1854.

CHOLERA SPASMODICA has continued amongst the troops of the Light Division, but the cases have assumed more of a sporadic type, and, generally speaking, have exhibited a milder and more manageable character. In the outbreak which occurred at Devna, and in those cases in which the cholera poison may be supposed to have been imbibed there, all the symptoms were present in their most virulent form—cramps, incessant rice-water vomiting and evacuations, suppression of all secretory action, prostration, turgidity of surface, speedy death, and muscular irritability continuing for some time after all vital functions had ceased. It would be idle to enumerate the various remedies resorted to, for in none of these cases was the *morbis ipse* reached at all; symptoms only were reached, and in most instances these were alleviated but slightly before the last and fatal stage set in. Neither in these instances, although disorders of the bowels had been prevailing for some time previous throughout the whole division, would there appear to have been traced any marked premonitory stage. In a few cases slight acts of indiscretion were discovered which seemed, like a spark to gunpowder, suddenly to irritate the latent disease into full action. As to the cases which have latterly occurred, in some the symptoms before named have been all present, but less violent in character and slower in progress; in others, some of them have been wanting altogether. The chief difficulty in many of these has been in treating the secondary fever, or raising the patient from the extreme debility consequent on the attack. It is in this stage more particularly that in the field hospital the absence is felt of many of those conveniences which are always to be found in civil hospitals, and which cannot be obtained here amongst a community so little civilized, and whose habits are so much at variance with those which prevail in other parts of Europe.

The prevalence of diarrhoea, and all the train of gastro-enteric irritation and dyspeptic symptoms, continues unchecked. Moreover, there is an amount of general debility far beyond what can be accounted for simply by temperature and climate, for it exceeds what is usually experienced after a much longer period passed in a tropical climate where the benefit of cool evenings and nights is not enjoyed. It is an important question how much influence the diet of the troops may have exerted in producing this result. The bread is dark-coloured and heavy. The corn-fields abound with weeds of all descriptions, and no care is taken to separate the seeds

of those from the corn preparatory to grinding. One of the contractors said that he could procure flour as fine as English or American flour, but a much higher price must be paid for it, for much more labour would be required in preparing it. From its appearance, the bread would seem to have a considerable proportion of rye-flour in it; but it is stated that it is wholly made from the wheat known as the bearded wheat, which is universally grown in this part of Bulgaria. The beef, which for a long time past has been the chief diet of the troops, seems universally condemned. It is coarse and tough; in short, the ox, being essentially a beast of draught and burden, is not proper for food. There is the principal portion of a Turkish regiment of cavalry, 400 strong, (the remainder being encamped with our cavalry brigade at Yeni-Bazaar,) attached to this division. They are now encamped lower on the plain than the line regiments, near to the royal horse artillery. They have not had a case of cholera in the regiment. Their chief meat, they say, is mutton; they avoid beef as much as possible. The men are a fine, hardy set of fellows; some of them really grenadiers in size; so that, glancing from them to their horses, it becomes a matter of surprise how so small a servant can carry so heavy a master, with his heavy lance and accoutrements. These soldiers would form an excellent example for argument in an oration by a temperance advocate.

To compensate for the deficiency in nutriment of the beef, the commander of the forces has ordered, by a general order of the 1st instant, that the ration of meat should be increased from one pound to one pound and a half during the present unhealthy season. By a previous order (July the 19th) a daily issue to each man of two ounces of rice or Scotch barley was authorized; so that if sufficient vessels for cooking are provided, the soldier ought now to have a substantial and nutritious soup. On the 31st of July, by another general order, half a gill of spirits was directed to be issued by the commissariat department for each non-commissioned officer and soldier, and the coffee lately ordered for the troops was directed to be used so as to produce a cup in the morning before going out on any duties, and another in the evening before going to rest. These arrangements, it is hoped, will produce much benefit.

The village of Monastir, near which this division is encamped, was formerly inhabited by Bulgarians of the Greek church, and their stone crosses still remain amongst the grave-stones of the neighbouring cemetery. It is said that they were ejected without any compensation or ceremony by the Turks. It consists of a collection of houses little better than mud-huts, with thatched roofs, placed without any regularity, and each with its surrounding vegetable garden or orchard enclosed by a high fence. No flower-beds are visible, nor any trace of refinement or industry. In the lanes between the houses are large dung heaps, the apparent accumulation of years; weeds grow on every side, and the whole place is stamped with the characters of indolence and neglect. One only redeeming point, and that which binds us to its neighbourhood, is its fountains. Of these there are several; small streams of water carefully carried through small stone conduits, from the ends of which the water flows constantly into a succession of stone troughs, placed at such a height that all animals, from the sheep or goat to the horse, can drink freely from them, or rather could drink before our arrival brought such a crowd of applicants to the spring. It is the difficulty of finding water which has prevented our camp from being again shifted before this date, to try the effect of a further move in ridding us of the disease which is amongst us. We are not yet out of the influence of the Devna plain. The face of the mountain bounding the lakes and marsh on the south looks down upon us; for the ridge of sloping land which separates us is much less elevated. Not unfrequently in the early morning the dense white vapour which rises from the lake forms a fleecy cloud above this intervening ridge, and obscures all, except just the summit, of the mountain beyond. The sea breeze rises, sweeps up the valley from Varna, and with the aid of the powerful heat of the rising sun the vapour is soon dispersed. The prevailing direction of the wind since arriving in this encampment has been from the south and south-east, just that which would drive any miasma that might float upwards from the marshes into a stratum of air higher than the intervening hills, directly upon us.

One great improvement in the present condition of the camp is the separation which has taken place in the encampments of the different regiments, and the consequent more free circulation of air. When the disease broke out at Devna, the two brigades of the Light Division, with the battalion of Rifle Brigade attached, were encamped closely together. The frontage of the whole camp for these seven regiments was, in all, about 850 yards; 144 paces, or about 120 yards, being

allowed for each regiment; the depth, on the average, was about 140 yards; so that, in a space of 840 by 140 yards, were dwelling upwards of 6000 men, and about 550 horses. The regiments of the two brigades are now separated as widely apart as is consistent with convenience for obtaining water and rations, and more space is allotted between the several tents of each regiment.

Flannel belts have been issued to a considerable number of the men, and it is expected that a further supply will shortly be received, so as to enable every man in the division to wear one. The great difference in the temperature before and after sunset renders this protection to the loins a most desirable acquisition. Medicines and medical stores have not been proportionate to the demand, notwithstanding every exertion on the part of the medical officers. It is understood that the difficulty of finding available transport has been the chief cause of the deficiency in this respect. The purveyors complain of want of clerks and assistants, to enable them to comply with the requisitions constantly made on their stores—a complaint constantly heard, too, and with apparent reason, amongst the officers of the commissariat department. The ambulance corps still continue at Varna; and in respect to sick or wounded, should transport be required for them, we should be as badly off in this division as we have ever been. The slow, ill-made, cumbrous bullock-wagon of the country would be our only resource in such an emergency.

The order from England for wearing the moustache was issued to the troops at Monastère this day, (August 7th.) It has been already, for some time past, adopted in other divisions,—it is presumed, with the sanction of the generals commanding them. That part of the order which enjoins the under lip, chin, and upper part of the throat to be shorn, as well as a fixed space on each side of the angle of the mouth, will prevent a fair test of the advantages which were anticipated, in a medical point of view, from the growth of the hair in this situation, whether as a respirator affecting the air passing to the lungs, or as an external protection under all circumstances of exposure to the upper part of the throat. In consequence of the number of men and officers who have suffered here from sore lips and chins, it is reported that the commander of the forces will, for the present, dispense with the use of the razor altogether. This will in many ways be a comfort and advantage to the soldier. Cleanliness may be preserved without razors, and one pair of scissors will cut the beards of a whole squad into a becoming shape without much expense of time or labour. Exposed as the British soldier constantly is, by his duties, to night air,—changing from the heated guard-house to the slow movement along his allotted beat,—and to all vicissitudes of climate, from the sun of the tropics to the extreme cold of Canada, not forgetting the damp fogs of England,—few can doubt that the growth of hair on the lower part of the face and upper part of the throat would be a valuable protection. But whether this growth can be permitted without detracting from that propriety of appearance and uniformity which the military eye requires—some persons are said to have a military eye *par excellence*, just as others have “an eye for a horse,” or “an eye for a picture”—is a matter which must be settled elsewhere.

The necessary preparations for the embarkation of the troops is described as going on with great rapidity in the transports and fleet. Yesterday a rumour went through the camp that cholera had broken out in some of the ships, but could not be traced to any reliable source. It is believed to be making considerable havoc in the French camps, and the deaths at Varna from the same cause are said to be numerous.

Assistant-Surgeon E. Alfred Jenkin, Senior Assistant in the 23rd Royal Welch Fusiliers, has died from an attack of the prevailing disease. He was one of the medical officers left behind at Devna, in charge of the sick who were unable to be moved at the time the Light Division quitted that encampment for Monastère. The Hospital Sergeant and the Hospital Orderlies of the 33rd, or Duke of Wellington's Regiment, who were also left behind to attend upon the sick at Devna, have all since died from cholera.

## Medical News.

**ILLNESS OF THE DUKE OF CAMBRIDGE.**—PARIS, Tuesday evening.—By Telegraph from Turkey, *vid Trieste*, it is stated that the Duke of Cambridge has been attacked with erysipelas. It is also reported that the *Ripon* had arrived at Malta with 160 sick on board.

**ROYAL COLLEGE OF SURGEONS.**—The following members of the College were admitted Fellows at the last meeting of the Council:—

ALDRIDGE, JOHN PETTY, Dorchester, June 6th, 1834.

BOWKER, RICHARD BYTHER STEER, New South Wales, May 7th, 1838.

BURGESS, FRED. JOSIAH, Bishops' Waltham, May 5th, 1834.

COOPER, THOMAS SANKEY, Canterbury, April 24th, 1839.

DALRYMPLE, DONALD, Norwich, August 19th, 1836.

FURNESS, THOMAS ALLASON, Newcastle-upon-Tyne, May 22nd, 1839.

HILL, SAMUEL, Clifton, Yorkshire, February 5th, 1836.

JOHNSON, CHRISTOPHER, Lancaster, February 22nd, 1839.

LOWES, FREDERICK JOHN, Gosport, May 13th, 1839.

MASSY, ISAAC, Nottingham, April 15th, 1831.

PART, JAMES, Camden-town, December 7th, 1832.

PURNELL, JOHN JAS., Charter-house-square, June 24th, 1839.

RUSSELL, GEORGE IRELAND, Gravesend, diploma of membership dated January 7th, 1820.

SLEEMAN, PHILIP ROWLING, Bristol, June 3rd, 1839.

STATTER, WILLIAM, Wakefield, February 3rd, 1829.

TURNER, SAM. MAYER, Newcastle-under-Lyne, May 6th, 1839.

At the same meeting —

D'OLIVER, ISAAC ARTHUR, of Tredegar-square, Bow-road, and EASTWOOD, THOMAS, of Oldham, Lancashire,

were admitted *ad eundem* members of the College.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, August 24th, 1854.

KERSHAW, BENJAMIN, Rochdale.

KING, DAVID, Ayr, N.B.

MORRIS, WILLIAM WHYTEHEAD, Stalbridge, Dorset.

PHILPOTT, HENRY GRAY, Brighton.

TURNER, THOMAS, Langport, Somerset.

WINDSOR, THOMAS, Manchester.

**UNIVERSITY OF LONDON.**—EXAMINATION FOR HONOURS.—*Anatomy and Physiology:* J. G. Blake, B.A., (Exhibition and Gold Medal,) University College; Henry Maudsley, (Gold Medal,) University College; Walter Barnett Ramsbotham, University College; Uriah Perrin Brodribb, B.A., Guy's Hospital; Edwyn Andrew, University College; Thomas Buzzard, King's College, John Lumsden Probert, King's College, and James Fitzjames West, St. Thomas's Hospital, equal; Samuel Giles, B.A., Guy's Hospital.—*Chemistry:* A. R. Kilroy, (Exhibition and Gold Medal,) London Hospital; John C. Thorowgood, (Gold Medal,) University College; Wm. Turner, St. Bartholomew's Hospital; Henry Maudsley, University College; James Gibbs Blake, B.A., University College.—*Materia Medica and Pharmaceutical Chemistry:* Wm. Turner, (Exhibition and Gold Medal,) St. Bartholomew's Hospital; Henry Maudsley, (Gold Medal,) University College; John Charles Thorowgood, University College; Uriah Perrin Brodribb, B.A., Guy's Hospital; James Gibbs Blake, B.A., University College, and Wm. Tiffin Iliff, Guy's Hospital, equal.—*Botany:* Jas. Gibbs Blake, B.A., (Gold Medal,) University College; Edwyn Andrew, University College, and Uriah Perrin Brodribb, B.A., Guy's Hospital, equal; Wm. Newman, St. Bartholomew's Hospital.

**APPOINTMENTS.**—Dr. Waller Lewis has accompanied the Right Hon. the Secretary of State for the Home Department and Viscountess Palmerston to their seat at Broadlands, in Hampshire, as their medical attendant during the existence of the present epidemic.—M. J. H. Sylvester, (Associate, King's College,) who held the studentship in Human and Comparative Anatomy at the Royal College of Surgeons in 1852 and 1853, and who was presented with an assistant-surgery in the East India Company's service last year, went out to India last January, and after being only a few months in Bombay, was nominated by the Governor (Lord Elphinstone) temporarily to fill the chair of Anatomy and Physiology in the Grant Medical College, and to be Curator of the Museum.—W. Dalton, Esq., F.R.C.S., has been appointed surgeon to Cheltenham College, vice J. Fortnom, Esq., resigned.—Dr. Quinlan has been appointed medical superintendent of the Borrisoleigh Dispensary, in place of Dr. Pinchin.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, AUGUST 26TH.**—In the week that ended last Saturday, the number of deaths arising from all causes was 2039. In the ten corresponding weeks of the years 1844-53, the average number was 1114, which, if raised in proportion to increase of

population, becomes 1225. The prevailing epidemic has produced an excess, amounting to 814, above the corrected average. In the thirty-fourth week of 1849, which ended August 25th, the total number of deaths registered was 2456. In that week the mean temperature was 62°·9; last week it was 61°·2, which is 1°·1 above the average. From cholera the deaths last week were 847, while those from diarrhoea were 214.

### Obituary.

On the 27th inst., of cholera, in the discharge of his professional duties as resident medical officer of the Westminster General Dispensary, Mr. CHARLES WATKINS TILLY, aged thirty-five. The deceased was admitted a member of the College, June 6th, 1842, and died regretted by all who had the pleasure of knowing him.

On the 28th inst., in London, after fourteen hours' illness, GEORGE COWLEY, of Winslow, Bucks, M.R.C.S. and L.S.A. As in life he was universally respected, so in death his loss is as widely and intensely deplored.

At Paris, WILLIAM HILL, M.D., aged thirty-two, late of Ballyhigh, Ireland.

At Bergeworth, Worcester, Dr. BEALE COOPER, in his eighty-second year. The deceased was mayor of Evesham for several years. He never practised much as a physician, his whole time being devoted to the interests and welfare of his native city. For a few years preceding his death he had been somewhat retired, not taking much part in public affairs.

At his residence, Liscreagh-cottage, Cork, EUGENE O'SULLIVAN, M.D.

Mr. E. A. JENKINS, Assistant-surgeon of 23rd Royal Welsh Fusiliers, of cholera.

### The BRITISH MEDICAL DIRECTORY for 1855.

ALL duly-qualified Medical Practitioners are respectfully requested to forward, as soon as possible, their "ENTRIES" or "RETURNS" for this Annual Volume. References to the Entries in the Directory for the current year, (1854,) stating that they are correct, will be sufficient. When alterations are required, they should be distinctly specified, and in all cases the names of the writers should be written clearly, and at full length.

Address to the Editors at the "BRITISH MEDICAL DIRECTORY" Office, 423, Strand.

### TO CORRESPONDENTS.

The Students' Number of THE LANCET will be published on the 16th of the present month. Prospectuses of Schools, Hospitals, and other Institutions, intended for insertion, should be forwarded immediately to the Office.

*An Inhabitant of the Edgeware-road.*—Such proceedings on the part of the road commissioners are to be deprecated at the present moment. We are fully aware of the very filthy state of the macadamised road in this locality, the under surface of which is in such a state of decomposition that it most engender disease. Cholera is already rife in the neighbourhood, and there is every reason to fear it will spread still more extensively if the works are carried on.

*Tyro.*—The work is published by Parker and Son, West Strand. Vol. 1, 18s.; vol. 2, not completed.

*McA.*—There is no clause in the University of London Medical Graduates Act empowering members of the Scotch Universities to practise in England.

#### THE CHOLERA.

To the Editor of THE LANCET.

SIR,—The successful treatment of cholera by Dr. G. Johnson, at King's College Hospital, by the administration of castor-oil and the application of heat, induces me to beg your insertion of this note, inasmuch as I have for some time given my attention to a suitable appliance for the application of heat, and I have succeeded in making a cushion or pillow of prepared india-rubber, that will resist the temperature of boiling water, and is so constructed as to dispense with the necessity of being removed from the body to alter the temperature; it may be applied wet or dry, so as to be equal to a warm bath, or dry air, or vapour bath, with a cataplasm or blister, or alone. Should any party be sceptical on the points adduced, I will be willing to send one, free of expense, to remove all doubt.

I am, Sir, your obedient servant,

PHILIP EAST, August, 1854.

W. HOOVER.

*A Juror, and others.* (Whitehaven.)—We have perused the report of the inquest on John Dixon, jun., contained in the *Whitehaven Herald*. Such scenes as that described by one of the medical witnesses are always injurious to the interests of the profession. Dr. Dixon is certainly not entitled to practise as an apothecary in England on his Glasgow qualification. Is it possible that the medical evidence given at the inquest by that gentleman is correctly reported? If so, it may be well asked, What was the object sought for from the means employed?

*Chirurgus.* (Brighton.)—Provided the case were not a medical one, an empiric could recover in the County Court "for work done and goods supplied." There is no law to prevent it. A member of the College of Surgeons, in the present state of matters, would stand in the same position.

*Chirurgus.*—We cannot recommend the work.

*A.*—Information will be found in the Students' Number, which will be published on the 16th instant.

#### TREATMENT OF CHOLERA BY PURGATIVES.

To the Editor of THE LANCET.

SIR,—About six weeks ago you published a letter of mine, signed "A Surgeon Afloat and Ashore," in which I stated that, by treating cases of cholera in the East Indies by purgative medicines, whatever might be the amount of purgation, I had never once failed in arresting the symptoms of that fatal disease, and restoring my patients to health within eight and forty hours. The medicines I employed were rhubarb and ipecacuanha, with a few grains of mercury with chalk, adding, in severe cases of spasm, some of the aromatic powder with soda, where there was acidity of the prime viæ, and always applying a large mustard poultice over the abdomen, made, where there was much pain of the bowels, with tincture of Spanish fly.

I perceive in the *Times* of Saturday last, that a Dr. George Johnson, of King's College Hospital, has adopted my plan with considerable success, and the article is headed, "Novel Mode of Treating Cholera." It would have been creditable to this gentleman had he acknowledged the source whence he derived his novel ideas, which, singularly enough, are precisely similar to those I published in your columns—viz., looking upon the disease as an effort of nature to throw off some offending matter, in which she was to be assisted by opening medicines and relaxants, instead of being frustrated by astringents and stimulants. Dr. Johnson, unwilling to adopt the medicines I advocated, has simply taken the principle of the practice, and has substituted castor-oil for rhubarb. I contend that the latter medicine is preferable to the former, as producing less debility. About three weeks ago, when in Paris, I wrote an account of my plan of treatment to the physicians of the *Hôtel Dieu*, "wha, should they adopt it, will, I have no doubt, be liberal enough not to arrogate to themselves the merit, if there be any, of a plan of treatment directly opposed to that hitherto in general use amongst surgeons."

I am, Sir, your very obedient servant,

J. BURKE.

*One of your Oldest Friends and Subscribers.*—Applotion should be made to Mr. H. Gilbert, Suffolk-street, Pall-Mall.

*Anti-Humbag.* (Weymouth.)—After carefully perusing the report of the proceedings at the meeting of the supporters of the Weymouth Sanatorium, we are unable to discover, either in Dr. Smith's speech or elsewhere, any statements to bear out the strictures of our correspondent.

*Bene Veno.*—Certainly.

*Dr. Stillman* will perceive the subject is noticed. It is probable we may still further refer to it.

*A Lady.* (Bristol.)—Chloride of lime, chloride of zinc, or common lime, would answer the purpose. The medicines named would stop the premonitory symptoms.

*A. B.*—The Town Hall would be a suitable place.

*Justitia.*—The report will most probably be commenced next week.

*G. S.*—1. No.—2. On the 1st of October.

*W. M.*—The cholera queries of the Cholera Committee of the Epidemiological Society may be obtained of Dr. Bryson, 8, Duke-street, St. James's; Dr. McWilliam, 14, Trinity-square, Tower-hill; or of Mr. Tucker, 38, Berners-street.

#### TARAXACUM.

To the Editor of THE LANCET.

SIR,—Will any of your correspondents tell me what ought to be a fair charge for a pound of the fluid extract of Taraxacum? One would think that for this article at least there should be something like uniformity of price, but I find it varies from 3s. 9d. to 22s. I observe this excellent remedy very freely advertised, but before ordering a thing we like first to know the cost.

I am, Sir, yours obediently,

A COUNTRY PRACTITIONER.

August, 1854.

COMMUNICATIONS, LETTERS, &c., have been received from — Sir George Ballingall; Mr. J. Beddingfield; Dr. David Nelson; Mr. John Baring; Mr. John Smith, (Ramsbottom); Mr. J. Burke; Dr. Pyemont Smith, (Leeds); Dr. Bedford; Dr. W. Alexander; Secretary of St. George's Hospital; Dr. R. White, (Naples); Mr. LeStrange; Dr. Foote; York School of Medicine; Queen's College, Birmingham; Tyro; Dr. Waller Lewis; Delta; Mr. J. Stansbury; Mr. Tusker; Dr. Macdonald, (Glasgow); Anti-Humbag; M. A.; A Subscriber, (Guernsey); Mr. Reeves, (Carlisle); X. Z.; Mr. Humble; Mr. James Figg, (Royal Dispensary, Pinlco); One of the Oldest Subscribers to THE LANCET; Dr. J. L. Crawcour; Mr. W. Stillman, (Whitehaven); Mr. Waters; Dr. Hope, (Seaford, with enclosure); Mr. J. Cogan, (Wheatley); Mr. R. B. Marriott, (Ipswich); Mr. T. Parrott, (Stratford); Mr. M. Curtler, (Gloucester, with enclosure); Mr. J. Fisher, (Ashull Moor); Mr. D. Cope, (Birmingham); Mr. Charles Taylor; Mr. T. Lowe, (Solihull, with enclosure); Mr. Oumming; Dr. Matthew Rao, (Carlisle); Mr. French; Dr. Goate, (Jersey, with enclosure); Mr. J. W. Way, (Southsea, with enclosure); Chirurgus, (Brighton); A Juror, (Whitehaven); Mr. W. Hooper; Justitia; G. S.; A Lady, (Bristol); A. B.; Enquirer; One of your Oldest Friends and Subscribers; A.; Chirurgus; Bene Veno; An Inhabitant of the Edgeware-road; Dr. Stillman; A Country Practitioner; Mr. John Brown; Mr. T. B. Tatham; Mr. Baines; &c. &c.

## Oleum Jecoris Aselli.

DR. DE JONGH'S LIGHT-BROWN  
COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES,  
NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

The most effectual Remedy for Consumption, Bronchitis, Asthma, Gout,  
Chronic Rheumatism, and all Scrofulous Diseases.

Approved of and recommended by BERZELIUS, LIEBIG,  
WÖHLER, JONATHAN PEREIRA, FOUQUIER, and numerous  
other eminent medical men and scientific chemists in Europe.

Specially rewarded with Medals by the Governments of  
Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the  
Continent, in consequence of its proved superior power and  
efficacy—effecting a cure much more rapidly.

Contains iodine, phosphate of chalk, volatile acid, and the  
elements of the bile—in short, all its most active and essential  
principles—in larger quantities than the pale oils made in  
England and Newfoundland, deprived mainly of these by their  
mode of preparation.

A pamphlet by DR. DE JONGH, with detailed remarks upon  
its superiority, directions for use, cases in which it has been  
prescribed with the greatest success, and testimonials, forwarded  
gratis on application.

The following are selected from some of the leading Medical  
and Scientific Testimonials in favour of Dr. de Jongh's  
Cod-liver Oil.

## BARON LIEBIG,

Professor of Chemistry at the University of Giessen, &c. &c.

"SIR,—I have the honour of addressing you my warmest  
thanks for your attention in forwarding me your work on the  
chemical composition and properties, as well as on the medicinal  
effects, of various kinds of Cod-liver Oil.

"You have rendered an essential service to science by your  
researches, and your efforts to provide sufferers with this  
Medicine in its purest and most genuine state must ensure you  
the gratitude of every one who stands in need of its use.

"I have the honour of remaining, with expressions of the  
highest regard and esteem, yours sincerely,

(Signed) "Dr. JUSTUS LIEBIG.

"Giessen, Oct. 30, 1847.

"To Dr. de Jongh at the Hague."

The late

## Dr. JONATHAN PEREIRA,

Professor at the University of London, Author of the "Elements of Materia  
Medica and Therapeutics," &c. &c.

"MY DEAR SIR,—I was very glad to find from you, when I  
had the pleasure of seeing you in London, that you were  
interested commercially in Cod-liver Oil. It was fitting that  
the author of the best analysis and investigations into the  
properties of this Oil should himself be the Purveyor of this  
important medicine.

"I feel, however, some diffidence in venturing to fulfil your  
request by giving you my opinion of the quality of the Oil of  
which you gave me a sample, because I know that no one can  
be better, and few so well, acquainted with the physical and  
chemical properties of this medicine as yourself, whom I regard  
as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of  
responding to your application. The oil which you gave me  
was of the very finest quality, whether considered with refer-  
ence to its colour, flavour, or chemical properties; and I am  
satisfied that for medicinal purposes no finer oil can be procured.

"With my best wishes for your success, believe me, my  
dear Sir, to be very faithfully yours,

(Signed) "JONATHAN PEREIRA.

"Finsbury-square, London, April 16, 1861.

"To Dr. de Jongh."

Sold Wholesale and Retail, in bottles, labelled with Dr.  
de Jongh's stamp and signature, by ANSAR, HARFORD,  
and Co., 77, STRAND, Sole Consignees and Agents for the  
United Kingdom and British Possessions; and by all respect-  
able Chemists and vendors of Medicine in Town and Country,  
at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... ... 4s. 9d.

IMPERIAL MEASURE.

"Hospitals and other Charitable Institutions requiring large  
quantities may be supplied on considerably reduced terms.

## Drug Price Currents forwarded free

of Postage, on application, by Messrs. HEWLETT and GODDARD,  
Wholesale Druggists, 46, Arthur-street West, Upper Thames-street, near  
London Bridge, removed from Hatton-garden; containing the ready Cash  
Prices for Drugs and Pharmaceutical Preparations of the purest quality,  
Messrs. H. and G. solicit the attention of the Medical Profession resident in  
the Provinces, Infirmary Committees, Dispensaries, &c. &c., to the advantages  
attendant upon the above Price Current.

## Pure Coco-Oleine, as prepared by

PRICE'S PATENT CANDLE COMPANY, for use at the Hospital for  
Consumption, Brompton. It has no unpleasant smell or taste, and is sold at  
about half the price of Cod-liver Oil, for which it often proves an efficient  
substitute. It may now be had in sealed quart and pint bottles, from all  
retail chemists and druggists, and wholesale from the principal wholesale  
druggists, and from Price's Patent Candle Company, Belmont, Vauxhall,  
London.—Imperial Quarts, 8s. 6d.; Imperial Pints, 2s.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN  
HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties  
being so beneficial where opiates are inadmissible: also to his MEDICINAL  
EXTRACTS, prepared from the fresh plants (*Hippocyanus Niger*, *Conium*  
*Maculatum*, *Atropo*, *Belladonna*, *Cotyledon Umbilicus*, &c.) also to his Liq.  
Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Farietaris (diuretic),  
and Liq. Belas (prepared from the *Egle Marmelos*, or *Indian Bead*), for Dy-  
sentery and Diarrhoea.

W.T. has a large supply of *ERIAN RAZEL* on hand.

2, Edwards-street, Portman-square.

## JOZEAU'S COPAHINE MEGE

Or SACCHARATED CAPSULES, approved of by the French College of  
Physicians, successfully administered in the Paris and London Hospitals, and  
acknowledged by them to be the best remedy for the cure of certain diseases.  
(See THE LANCET of November 6th, 1852.) Price per 100, 4s. 6d.; 50, 2s. 6d.

To be had of the Inventor, GABRIEL JOZEAU, French Chemist, 49, Hay-  
market, London, whose name is printed on the Government stamp; and all  
the principal Chemists.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS,  
(vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations  
specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Insipiated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's) Liquor, or Fluid Extract, prepared by Spontaneous  
Insipiation, possesses every characteristic of the Fresh Juice, and has proved  
highly efficacious where the ordinary Extracts have proved inert. Dose, a  
liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge,  
33, Great Russell-street, Bloomsbury.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

## Major's Remedies for the Horse,

the best and most effectual ever discovered, superseding the "burning  
iron" and the torture of the "cautery."

MAJOR'S BRITISH REMEDY, for the cure of ringbone, spavins, splints  
&c. A single bottle sufficient to cure from four to six spavins, 11 15s.

MAJOR'S SYNOVITIC LOTION, (the Remedy, No. 2.) for grogginess,  
weak joints, sprains of the back sinews, ruptures of the sheaths of tendons,  
suspensory ligaments, shoulder lameness, and inflammation; also for the cure  
and prevention of breaking down, &c.—In bottles, large size, 11 1s.; small,  
10s. 6d. each. The above invaluable remedies can now be forwarded to any  
part of the United Kingdom. Pre-payment by check or post-office order,  
made payable to Joseph Major, Post Office, Charing-cross.

JOSEPH MAJOR, Horse Infirmary, British-yard, Cockspur-street,  
Charing-cross.

DOUBLE PATENT.

## Briet's portable Gazogene,

OR SODA-WATER APPARATUS,

for the immediate production of Soda-water, Ginger-  
beer, sparkling Wine, Lemonade, &c. &c.

SPECIAL POWDERS for generating Gas in the  
same, cheaper and more effective than any other  
preparation.

SELTZER POWDERS, prepared from a recent  
analysis of the fresh water from the spring by a cele-  
brated German chemist.

PATENT REFRIGERATOR, or Gazogene-Cooler

PATENT PORTABLE FILTER, a cheap and  
useful article, not occupying more than four to six  
inches in space, and filtering from six to ten gallons  
per twenty-four hours, suitable for Military, Navy, and  
Travellers in all Climates.

Sole Wholesale Agents, GEBHARDT, ROTTMANN  
and Co., 21, Bartlett's-buildings, Holborn, London.

NOTICE is hereby given, that proceedings will be  
adopted against all parties selling or exposing for sale  
the imitations of the above-named articles, as the said  
imitations are infringements upon these patents.

## London Hospital Medical College.—

The WINTER SESSION will Commence on Monday, October 2nd, when an Inaugural Address on the opening of the New College will be delivered by Dr. LITTLE, at Three P.M.

Medicine—Dr. Little.  
Surgery—Mr. Curling, F.R.S., and Mr. Critchett.  
Descriptive and Surgical Anatomy—Mr. Adams.  
General Anatomy and Physiology—Dr. Carpenter, F.R.S.  
Practical Anatomy—Mr. N. Ward, Mr. Wordsworth, and Mr. Gowland.  
Chemistry—Dr. Letheby.  
Pathological Histology—Dr. Clark.  
Dental Surgery—Mr. Barrett.

SUMMER SESSION, 1855, commencing May 1st.

Midwifery—Dr. Ramsbotham.  
Materia Medica—Dr. Davies.  
Forensic Medicine—Dr. Ramsbotham and Dr. Letheby.  
Botany—Mr. Bentley.  
Comparative Anatomy—Mr. Coles.  
Practical Anatomy—Dr. Letheby.

General fee to the Lectures, £50; to the Hospital Practice and Lectures, eighty-four guineas, payable in two instalments of forty-two guineas each, at the commencement of the two first Winter Sessions. Applications by post to be made to the Honorary Secretary.

## St. Bartholomew's Hospital and MEDICAL COLLEGE.—The WINTER SESSION will Commence on

October 2nd, with an Introductory Address by Dr. BURROWS, at seven o'clock P.M.

### LECTURES.

Medicine—Dr. Burrows.  
Surgery—Mr. Lawrence.  
Descriptive Anatomy—Mr. Skeay.  
Physiology and Morbid Anatomy—Mr. Paget.  
Chemistry—Mr. Stenhouse.  
Superintendence of Dissections—Mr. Holden and Mr. Coota.

SUMMER SESSION, 1855, Commencing May 1st.

Materia Medica—Dr. Roupell.  
Botany—Dr. F. Farre.  
Forensic Medicine—Dr. Baly.  
Midwifery, &c.—Dr. West.  
Comparative Anatomy—Mr. M'Whinnie.  
Practical Chemistry—Mr. Stenhouse.  
Natural Philosophy—Dr. Martin.

HOSPITAL PRACTICE.—The Hospital contains 650 beds, and relief is afforded to nearly 90,000 patients annually. The in-patients are visited daily by the Physicians and Surgeons, and Clinical Lectures are delivered weekly; those on the medical cases, by Dr. Roupell, Dr. Burrows, and Dr. Farre; those on the surgical cases, by Mr. Lawrence, Mr. Stanley, Mr. Lloyd, and Mr. Skeay. The out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

COLLEGIATE ESTABLISHMENT.—Warden, Dr. BLACK. Students can reside within the Hospital walls, subject to the rules of the Collegiate system, established under the direction of the Treasurer and a Committee of Governors of the Hospital. Some of the teachers and other gentlemen connected with the Hospital also receive students to reside with them.

SCHOLARSHIPS, PRIZES, &c.—At the end of the Winter Session, examinations will be held for two Scholarships of the value of £15 for a year. The examination of the classes for prizes and certificates of merit, will take place at the same time.

Further information may be obtained from Mr. Paget, or any of the Medical or Surgical Officers or Lecturers, or at the Anatomical Museum or Library.

## King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1854-5, will Commence on Monday, October 2, 1854.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.  
Physiology and General and Morbid Anatomy—Professors W. Bowman, F.R.S., and Lionel S. Beale, M.B.  
Chemistry—Professor W. A. Miller, M.D., F.R.S.  
Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.  
Principles and Practice of Surgery—Professor William Fergusson, F.R.S.  
Logic and Natural Philosophy, as required by the Army Medical Board.

### KING'S COLLEGE HOSPITAL.

The new Out-patient Department, and a large portion of the new building, will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by Professors Partridge and Fergusson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience for the attainment of Practical Chemistry, and for the prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the next Winter Session will have the exclusive privilege of contending for three Warneford Scholarships of £25 per annum, for three years. The subjects for the examination, which will commence on September 30, are, Divinity, Classics, Mathematics, History, and Modern Languages, equal marks being assigned to each subject. The classical books fixed on by the examiners for this year are the same as those announced for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £30, and three of £20 each, tenable for two years, will be filled up in April next, the subjects of the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or upon application to J. W. Cunningham, Esq., Secretary.

June, 1854.

R. W. JELF, D.D., Principal.

## Mr. G. Hind, F.R.C.S., will resume

his DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.

Class-room, 20, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

## Medical College, Royal Free Hos-

PITAL.—During the WINTER SESSION, 1854-55, whilst this Institution is undergoing the alterations and extensions required by the Royal College of Surgeons,

COURSES OF PRACTICAL INSTRUCTION ON ANATOMY and SURGERY will be given by Dr. Knox (late Lecturer on Anatomy, Edinburgh), and by Mr. GALT, Co-Lecturers on Anatomy and Physiology.

Terms and any further particulars may be obtained on application at the Office of the College.

## The Royal London Ophthalmic

HOSPITAL, MOORFIELDS. FOUNDED 1804.

Consulting Physician—Dr. Farre. | Physician—Dr. F. J. Farre.  
Surgeons—G. W. Mackmurdo, Esq., F.R.S.; J. Dixon, Esq.; G. Critchett, Esq.; W. Bowman, Esq., F.R.S.; A. Poland, Esq.  
Assistant-Surgeon—J. C. Wordsworth, Esq.

During the past year, 10,421 Patients were treated at this Hospital, and 380 Operations performed, 183 being for Cataract. The Patients are seen daily at Nine o'clock, and Operations performed on Fridays at Ten.

Fee for attendance on the Practice for ONE YEAR, or with the consent of the Medical Officers for an unlimited period, £5 5s.: for THREE MONTHS, £3 3s.

## Charing-cross Hospital Medical

SCHOOL, WEST STRAND, LONDON.

WINTER SESSION, October, 1854, to March, 1855.

Chemistry—H. H. Lewis, A.M.  
Anatomy—Mr. E. Canton.  
Demonstrations and Dissections—Mr. Goldsbro.  
Surgery—Mr. Hancock.  
Physiology and Pathology—Dr. Hyde Salter.  
Medicine—Dr. Chowne and Dr. Bowland.

SUMMER SESSION, May, 1855, to the end of July.

Practical Chemistry in the Laboratory—H. Lewis, A.M.  
Materia Medica—Dr. Stegall and Dr. Willshire.  
Botany—F. W. Headland, B.A.  
Midwifery, &c.—Dr. Chowne and Mr. Hird.  
Medical Jurisprudence—Dr. G. Birkett and Mr. Hird.

All the Lectures required by the College of Surgeons and Society of Apothecaries, £45, without Practical Chemistry, which is £2 2s.

### HOSPITAL PRACTICE.

Consulting-Physician—W. Shearman, M.D.  
Physicians—Dr. Golding and Dr. Chowne.  
Assistant-Physician—Dr. Rowland.  
Surgeons—Mr. Hancock and Mr. Avery.  
Assistant-Surgeon—Mr. E. Canton.

MEDICAL PRACTICE.—Full period required, £15 15s. Surgical, £15 15s. Both Medical and Surgical, £26 5s.

JOHN ROBERTSON, Hon. Sec.

## St. Mary's Hospital and Medical

SCHOOL.—The WINTER SESSION will Commence on Monday, the 2nd of October, with an Introductory Address by Dr. ALDERSON, F.R.S., at Half-past Two o'clock.

### LECTURES.

Anatomy and Physiology—Mr. Lane and Dr. Handfield Jones.  
Descriptive and Surgical Anatomy—Mr. Haynes Walton and Mr. James Lane.  
Pathological Anatomy—Dr. Markham.  
Chemistry—Dr. Albert J. Bernays.  
Medicine—Dr. Chambers and Dr. Sibson.  
Surgery—Mr. Coulson and Mr. Spencer Smith.  
Clinical Medicine—Dr. Alderson.  
Clinical Surgery—Mr. Ure.

SUMMER SESSION, 1855, commencing May 1st.

Botany—Dr. J. S. Burdon Sanderson.  
Materia Medica—Dr. Sieveking.  
Practical Chemistry—Dr. Albert J. Bernays.  
Midwifery, &c.—Dr. Tyler Smith and Mr. I. Baker Brown.  
Medical Jurisprudence—Mr. Ancell.  
Military Surgery—Dr. James Bird, F.R.C.S.E.  
Ophthalmic Surgery—Mr. White Cooper.  
Aural Surgery—Mr. Toynbee.  
Dental Surgery—Mr. Nasmyth.  
Comparative Anatomy—  
Natural Philosophy—

HOSPITAL PRACTICE.—The hospital contains upwards of 160 beds, 65 of which are devoted to Medical, and the rest to Surgical, cases. This division includes a ward appropriated to the Diseases of Women, and also beds for Ophthalmic and Aural cases. A Maternity Department is attached to the hospital: 218 poor married women were delivered at their own homes during the past year. The in-patients are visited daily by the Physicians and Surgeons at one o'clock. Lectures on Clinical Medicine will be regularly delivered by Dr. Alderson, and on Clinical Surgery, by Mr. Ure; and occasionally by the other Medical Officers in their respective departments. The Out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

There are three Resident Medical Officers, who board in the hospital, and are appointed for eighteen months; two non-resident Medical Officers; a Medical and a Surgical Registrar. Clinical Clerks and Dressers will be selected from the best-qualified Students. All the above offices are open to competition amongst the qualified Perpetual Pupils of the hospital, without extra fee.

Further information may be obtained on application to the Dean of the School, who will also furnish the names of gentlemen in practice in the vicinity of the hospital, willing to receive Pupils to reside with them.

St. Mary's Hospital,  
Aug. 8th, 1854.

H. SPENCER SMITH,  
Dean of the School.

# University of Edinburgh.

SEPTEMBER 1st, 1854.  
The Session will be publicly opened on Tuesday, October 31st, at Two o'clock P.M., when an Address to the Students will be delivered by the Very Reverend JOHN LEE, D.D., Principal.

The Classes for the different branches of Study will be opened as follows:—

## I. LITERATURE AND PHILOSOPHY.

Classes.	Days and Hours of Attendance.	Professors.
Junior Humanity .....	Wed. Nov. 1, twelve and two o'clock.	Professor Pillans, 43, Inverleith-row.
Senior Humanity .....	Wed. Nov. 1, nine o'clock (half-past eight).	
First Greek .....	Wed. Nov. 1, ten and one o'clock.	Professor Blackie, 43, Castle-street.
Second Greek .....	Wed. Nov. 1, eleven o'clock.	
Third Greek .....	Thurs. Nov. 2, two o'clock.	
First Mathematical .....	Wed. Nov. 1, twelve o'clock.	Professor Kelland, 20, Clarendon-crescent.
Second Mathematical .....	Wed. Nov. 1, ten o'clock.	
Third Mathematical .....	Mon. Nov. 3, nine o'clock.	
Logic and Metaphysics .....	Wed. Nov. 1, one o'clock.	Sir W. Hamilton, Bt., 16, Great King-st.
Moral Philosophy .....	Wed. Nov. 1, twelve o'clock.	Prof. M'Dougall, 6, Clarendon-crescent.
Natural Philosophy .....	Wed. Nov. 1, eleven o'clock.	Professor Forbes, 3, Park-place.
Rhetoric and Belles Lettres .....	Tues. Nov. 7, four o'clock.	Professor Aytoun, 16, Great Stuart-street.
Practical Astronomy .....	Tues. Nov. 7, twelve o'clock.	Professor Smyth, 1, Hillside-crescent.
Agriculture .....	Thurs. Nov. 9, four o'clock.	Professor Low, Mayfield, Trinity.
Universal History .....	Tues. Nov. 14, two o'clock.	Professor Innes, 15, Inverleith-row.
Theory of Music .....	Wed. Nov. 1, twelve and three o'clock.	Professor Donaldson, Marchfield.

## II. THEOLOGY.

Divinity .....	Tuesday, Nov. 14, eleven o'clock.	Principal Lee, College.
Divinity and Church History .....	Tuesday, Nov. 14, twelve o'clock.	Rev. Jas. Robertson, D.D., 25, Ainslie-pl.
Hebrew { Junior Class .....	Tues. Nov. 14, nine o'clock.	Rev. David Liston, Elm Cottage, Whitehouse Loan.
{ Advanced Class—Hebrew & Syriac .....	Tues. Nov. 14, ten o'clock.	
Biblical Criticism and Biblical Antiquities .....	Tues. Nov. 14, one o'clock.	Rev. Robt. Lee, D.D., 24, George-square.

## III. LAW.

Civil Law .....	Tues. Nov. 7, three o'clock.	Prof. Camb. Swinton, Inverleith-row.
Law of Scotland .....	Tues. Nov. 7, three o'clock.	Professor More, 19, Great King-street.
Conveyancing .....	Tues. Nov. 7, four o'clock.	Professor Menzies, 10, Hill-street.

## IV. MEDICINE.

Dietetics, Materia Medica, and Pharmacy .....	Wed. Nov. 1, nine o'clock.	Dr. Christison, 40, Moray-place.
Chemistry .....	Wed. Nov. 1, ten o'clock.	Dr. Gregory, 114, Princes-street.
Surgery .....	Wed. Nov. 1, ten o'clock.	Professor Miller, 51, Queen-street.
Institutes of Medicine .....	Wed. Nov. 1, eleven o'clock.	Dr. Bennett, 1, Glenfinlas-street.
General Pathology .....	Wed. Nov. 1, eleven o'clock.	Dr. Henderson, 61, Northumberland-st.
Clinical Surgery .....	Thurs. Nov. 2, twelve o'clock.	Professor Syme, 2, Rutland-street.
(Monday & Thursday)		
Clinical Medicine .....	Frid. Nov. 3, twelve o'clock.	Drs. Alison, Christison, and Bennett.
(Tuesday & Friday)		
Anatomy .....	Wed. Nov. 1, one o'clock.	Professor Goodair, 16, Dean-terrace.
Natural History .....	Thurs. Nov. 2, two o'clock.	Professor Ed. Forbes, College.
Midwifery and Diseases of Women and Children .....	Wed. Nov. 1, two o'clock.	Dr. Simpson, 52, Queen-street.
Practice of Physic .....	Wed. Nov. 1, three o'clock.	Dr. Alison, 44, Heriot-row.

## ROYAL INFIRMARY, at Noon, Daily.

Practical Anatomy, under the Superintendence of Professor Goodair.  
Practical Chemistry, under the Superintendence of Dr. Gregory.  
Analytical Chemistry, under the Superintendence of Dr. Gregory.

## ORIENTAL LANGUAGES.

The Professor of Oriental Languages proposes during the Session to attend in the College, with the view of giving instructions in Hindustani, &c. For particulars apply to Mr. Small, at the Library.

## LECTURES ON MINERALOGY AND GEOLOGY.

The Thompsonian Lectures on Mineralogy and Geology, will be delivered during the latter half of the usual Winter Course of Natural History, and be open to all who may choose to attend, separate tickets being issued for the same. The fee for this latter half of the Course is fixed at two guineas. The fee payable for the entire Winter Course—attendance on which alone will form part of the ordinary Medical Curriculum—remains as at present.

For the encouragement of persons, not ordinary Students at the University, who may desire to attend the Lectures on Mineralogy and Geology, they will be specially matriculated on payment of a reduced Matriculation fee of five shillings; it being understood that while such non-professional Students shall have the same access to the Museum as the Students of Natural History, they shall not have the privilege of access to the Library.

## UNIVERSITY OF EDINBURGH—Continued.

During the SUMMER SESSION, Lectures will be given on the following Branches of Education:—

Botany—by Dr. Balfour.  
Histology—by Dr. Bennet.  
Medical Jurisprudence—by Dr. Traill.  
Theory of Music—by Professor Donaldson.  
Military Surgery—by Sir George Ballingall.  
Clinical Medicine.  
Clinical Surgery—by Professor Syme.  
Comparative Anatomy—by Professor Goodair.  
Anatomical Demonstrations—by Professor Goodair.  
Practical Chemistry and Pharmacy.  
Practical Anatomy.

**MATRICULATION.**—Every Student, in the Faculties of Arts, Law, and Medicine, before entering with any Professor, must produce a Matriculation ticket for the ensuing Session. Tickets will be issued at the Matriculation Office in the College, every lawful day, from Ten till Four o'clock. Enrolment in the General Album is the only legal record of attendance in the University, except in the case of Students of Divinity, who are required to enrol at the Theological Library before applying for tickets from Professors in the Faculty of Theology.

**LIBRARY.**—The Library will be open for the purpose of giving out Books to Students, either on loan, or for reference in the Hall appropriated for that purpose, every lawful day during the Winter Session from Ten o'clock A.M. till Four o'clock P.M.; except on Saturdays, when it will be shut at One o'clock precisely.

Every Student applying for Books, must present to the Librarian his Matriculation Ticket for the Session, with the ticket of at least one Professor.

Every Book taken out must be returned within a fortnight, uninjured.

N.B.—Information relative to the Curriculum of Study for Degrees, Examinations, &c., may be obtained, on application to the Secretary, at the College.

A table of fees may be seen in the Matriculation Office, and in the Reading-room of the Library.

By authority of the Patrons of the University,

ALEX. SMITH,  
Sec. to the University.

## Surgeons' Hall, Edinburgh,

WINTER SESSION, 1854-55.

The following Courses of Lectures on Medical Science, and also those delivered in the University, qualify for Examination for the Diploma of the Royal College of Surgeons. All the Courses are for Six Months, if not otherwise specified.

## CLASSES OPEN ON FRIDAY, NOVEMBER 3rd.

Surgery—Mr. Mackenzie, 10 A.M.	
Surgery—(4, High School Yards), Mr. Spence, 10 A.M.	
Chemistry—Dr. George Wilson, 11 A.M.	
Analytical Chemistry, (Three Months' Course.)	Dr. George Wilson, 9 A.M. assisted by Dr. Macadam, till 4 P.M.
Natural Philosophy—(School of Arts), George Lees, LL.D., 12 noon.	
Clinical Medicine .....	Dr. Wm. Robertson, 12 noon.
(Royal Infirmary, Tuesdays and Fridays.)	
Clinical Surgery .....	Mr. Mackenzie, 12 noon.
(Royal Infirmary, Tuesdays and Fridays.)	
Anatomy .....	Dr. John Struthers, 1 P.M.
Anatomical Demonstrations .....	4 P.M.
Practical Anatomy—Dr. John Struthers, assisted by Dr. Greig, 9 A.M. till 4 P.M.	
Materia Medica and Dietetics—Dr. Douglas MacLagan, 2 P.M.	
Practice of Physic—Dr. Alexander Wood, 3 P.M.	
Practice of Physic—(4, High School Yards), Dr. W. T. Gairdner, 3 P.M.	
Pathology—(Royal Infirmary), Dr. Rutherford Haldane	
Royal Infirmary, at noon daily.	

By order of the Royal College,  
JOHN SCOTT, Secretary.

The Introductory Address will be delivered by Mr. SPENCE, on Thursday, Nov. 2nd, at 2 P.M.

**FEES.**—For the First of each of the above Courses, £3 5s.; for the Second, £2 4s.; Perpetual, £5 5s. To those who have already attended a First Course in Edinburgh, the Perpetual Fee for that Class is £2 4s. The Fees for the following Courses are,—Natural Philosophy, Practical Chemistry, and Practical Anatomy, £3 3s.; Anatomical Demonstrations, £2 2s. Practical Anatomy, with Demonstrations, £4 4s.; Analytical Chemistry, £2 a month, or £10 for the Winter Session. *Royal Infirmary*, Perpetual Ticket, £12 17s.; Annual, £2 7s. 6d.; Half-yearly, £3 5s. 6d.; Quarterly, £1 13s. Edinburgh Maternity Hospital, Six Months, £1 3s.

During the SUMMER SESSION, 1855, the following Three Months' Courses will be delivered:—

Natural Philosophy—Dr. Lees.  
Medical Jurisprudence—Dr. Rutherford Haldane.  
Midwifery—Dr. Kellier.  
Midwifery—(4, High School Yards), Dr. J. Matthews Duncan.  
Clinical Surgery—Mr. Mackenzie.  
Practical Anatomy, with Demonstrations—Dr. John Struthers, assisted by Dr. Greig.  
Practical and Analytical Chemistry—Dr. Wilson, assisted by Dr. Macadam.

The above Courses of Lectures qualify for Examination at the Royal Colleges of Surgeons of Edinburgh, England and Ireland; the Apothecaries' Hall, London; the Faculty of Physicians and Surgeons of Glasgow; the Boards of the Army, Navy, and East India Company; and also, so far as required, for the Universities of London, Oxford, Cambridge, St. Andrews, Aberdeen, and the Queen's University, Ireland.

In accordance with the recent statutes of the University of Edinburgh, one-third of the entire Medical Classes required for Graduation may be attended under any of the above Teachers; and one of the four years of Study required for the University Degree may be constituted by attendance, in one year, on two of the above Six Months' Courses, or on one of these and two Three Months' Courses.

Those who hold a Scotch or Irish Diploma, or Degree in Surgery, are admitted to the same rights under the Poor Law Amendment Act as Members of the Royal College of Surgeons of London.

Students are requested to bear in mind that the *Registration* at Surgeons' Hall closes on 30th November.

## A Member of the College and Hall

died, yesterday, in Horseman-grove-lane Prison, where he had been for a few weeks incarcerated for debt. He was always industrious, but had suffered from softening of the Medulla. His Wife and Children are actually destitute, and the most trifling Donation will be very thankfully received for them by Dr. W. Vesalius Pettigrew, 7, Chester-street, Grosvenor-place.

August 31st, 1854.

## The City and Borough Hospitals.—

A Hospital Physician, possessing ample means of instruction, who is acquainted by personal experience with the requirements of all the London Examining Boards, including the University of London, and whose residence is most conveniently situated in reference to the City and Borough Hospitals, has a Vacancy for a PUPIL.—For terms, &c., apply to Dr. Barnes, 13, Devonshire-square.

## Private Medical Tuition.—

A Physician of a practical and scientific reputation, residing near Russell-square, receives HOUSE-PUPILS, as well as others, whose Medical Education, in all its branches, will be carefully and privately instructed by teachers of great experience and acknowledged ability. As a private Medical School, this establishment offers unequalled facilities for enabling Medical Students to undergo the requisite Medical, Surgical, and Chemical Examinations at the different Boards. The Students must be instructed singly or in classes, as they may prefer.—Apply to Tans LANCET Office.

N.B. A Chemical Laboratory on the Premises.

## Bristol Medical School.—

SESSION 1854—1855.

The WINTER SESSION will Commence on Monday, October 2nd, and terminate in the middle of April, 1855, with a Fortnight's Recess at Christmas. The following Courses of Lectures will be delivered:—

Principles and Practice of Surgery—Mr. Clark and Mr. Pritchard.  
Theory and Practice of Physic—Dr. W. Budd and Dr. Stanton.  
Chemistry—Mr. Herapath.  
General Anatomy and Physiology—Dr. Brittan and Mr. Coe.  
Descriptive and Surgical Anatomy—Dr. Brittan and Mr. C. Leonard.  
Superintendence of Dissections—Mr. C. Leonard.

At the conclusion of the Session, Prizes will be delivered in accordance with the Regulations of the School.

Certificates of attendance upon the Lectures delivered at the Bristol Medical School, qualify Students for Examinations at the Royal College of Surgeons, at the Apothecaries' Hall, and the University of London.

It is intended that attendance upon these Lectures should not necessarily be restricted to Medical Students alone, and arrangements have been made by which Pharmaceutical Pupils may be introduced, by the Secretary of the Society, to attend the Course of Lectures upon Chemistry, Materia Medica, and Botany.

Fee for unlimited attendance upon all the Courses of Lectures required by the London Examining Bodies, Forty-five Guineas. Students from a distance may be provided with Board and Lodging in the house of a Gentleman under the recommendation of the Faculty of the School.

Information upon all particulars may be obtained upon application at the School, or to the Honorary Secretary.

Medical School, Old Park, Bristol,  
August, 1854.

JOHN STANTON, M.D., Hon. Sec.

## Leeds School of Medicine.

TWENTY-FOURTH SESSION.

The WINTER SESSION will Commence on Monday, October 2nd, 1854, when J. T. IKIN, F.R.C.S., President, will deliver the Introductory Lecture, at Twelve o'clock.

Anatomy, Physiology, and Pathology—Mr. Ikin, Mr. S. Hey, Mr. Wm. Nicholson Price, and Mr. C. G. Wheelhouse.  
Descriptive Anatomy—Mr. Wm. Nicholson Price, and Mr. C. G. Wheelhouse.  
Principles and Practice of Surgery—Mr. Hey and Mr. Nunneley.  
Chemistry—Mr. Morley and Mr. Scattergood.  
Principles and Practice of Physic—Dr. Chadwick and Dr. Heaton.  
Superintendent of Dissections—Mr. E. W. Ward.

SUMMER SESSION, 1855, Commencing May 1st.

Materia Medica and Therapeutics—Mr. Bishop.  
Midwifery and Diseases of Women and Children—Mr. Smith and Mr. Braithwaite.

Forensic Medicine—Dr. Pyemont Smith.  
Botany—Dr. Heaton.  
Practical Chemistry—Mr. Scattergood.  
Operative Surgery—

\*.\* Application for Tickets may be made to the Treasurer, Mr. Samuel Hey, Albion-place.

N.B.—Attendance at the above Lectures will confer the same Qualification for Examination as is obtained in the Medical Schools of London.

Clinical Lectures will be given at the General Infirmary on Medical Cases, by Dr. Chadwick and Dr. Heaton; On Surgical Cases, at the General Infirmary, by Mr. Smith, Mr. T. P. Teale, and Mr. Samuel Hey; On Ophthalmic and Aural Practice, at the Eye and Ear Infirmary, by Mr. Nunneley. Medical Libraries are connected both with the School and the Infirmary.

## Clerical, Scholastic, and Governess

AGENCY OFFICES, (late Valpy, Established 1833.), 7, TAVISTOCK-ROW, COVENT-GARDEN, LONDON. The gentry and families requiring Tutors, Governesses, or Companions, for either residence, travelling, or daily attendance, on making known their requirements to Messrs. MAIR and SON, will at once be introduced FREE OF CHARGE to qualified and experienced applicants with good testimonials. Schools recommended, and Ecclesiastical and School property transferred. A prospectus forwarded on application.

TO THE PROFESSION.

## Mr. Bowmer, M.R.C.S. Eng., 50,

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

TO MEDICAL MEN.

## Any one desirous of visiting the Sea—

side or retiring for a time from the cares of Practice, may hear of a qualified SUCCESSOR by addressing, M.D., Post-office, Nottingham.

## Partnership.—A Gentleman possess—

ing the usual qualifications, who has been engaged for several years in General Practice, desires a small SHARE in a large Business.—Address, X. Y. Z., Mr. Maddox, University-street, University-college, London.

## A Student is desirous of a Situation

as DISPENSER to a Surgeon, by whom his services will be considered as an equivalent to Board and Lodging. Time to attend Lectures, &c.—Address, X. Y. Z., Middlesex-hospital, Berners-street.

## Wanted, by a General Practitioner,

an ASSISTANT to Dispense, occasionally Visit, and attend Midwifery.—Apply, by letter, stating age and salary required, to H. B., 13, Baker-street, Portman-square, London.

MEDICAL.

## To be Disposed of, on very advan—

tageous terms, a well-established PRACTICE, situated in Shropshire, now doing a good Business. The house is large, and with every requisite for a genteel family residence, with a good garden, at a moderate rental. To a Gentleman wishing a good Country Practice, this will be found a desirable opportunity, as the most satisfactory reasons will be given for the disposal of it.—For particulars, apply to Mr. P. Harris, Wholesale Chemist, Birmingham.

## Halifax Infirmary and Dispensary.

Wanted, a RESIDENT MEDICAL OFFICER to the above Institution, who is required to be a Licentiate of the Society of Apothecaries. The salary is £80 per annum, with Board and Lodging, and a Compounder is provided. The appointment is vested in the Medical Staff, and will take place on Wednesday, the 27th of September next. Testimonials to be sent in by Saturday, the 23rd of September, addressed to the Venerable Archdeacon Musgrave, D.D., President of the Institution, Halifax.

Halifax, August 23rd, 1854.

## Kidderminster Infirmary.—Wanted,

a HOUSE-SURGEON to this Institution, who will be required to act as SECRETARY. Salary £80 per annum, with furnished rooms, coals, and candles. He must be a M.R.C.S. of London, Edinburgh, Dublin, or Glasgow, and will be required to enter into a Bond not to practise within six miles of the town of Kidderminster for five years after he leaves the Infirmary.—Applications, stating age, accompanied by testimonials, to be forwarded to the Committee at the Infirmary, on or before the 12th of September next.

August 23rd, 1854.

TO THE MEDICAL PROFESSION.

## Hanwell Lunatic Asylum.—A

Vacancy has occurred in the Office of RESIDENT MEDICAL OFFICER of the Female Department of the Middlesex County Pauper Lunatic Asylum at Hanwell; and gentlemen desirous to become Candidates for the appointment must be Fellows or Members of the Royal College of Surgeons, and Members or Licentiates of the Apothecaries' Company, married, and between thirty and fifty years of age. The salary will be £200 per annum, with board, including coals and candles, and residence at the Asylum.

Candidates are requested to send in testimonials, addressed to the Committee of Visitors of the Hanwell Lunatic Asylum, on or before the 2nd of October next, under cover to me, at the Sessions House, Clerkenwell-green, where information as to the duties to be performed may be obtained; and they must personally attend the Committee of Visitors, at the Sessions House aforesaid, on Friday, the 13th day of October, at Eleven o'clock precisely, on which day the Election will take place.

CHARLES WRIGHT, Clerk to the Visitors.

Dated this 24th of August, 1854.

TO THE MEDICAL PROFESSION.

## Dorset County Lunatic Asylum,

Forston, near Dorchester.—A Vacancy having occurred in the office of RESIDENT MEDICAL OFFICER of the Dorset County Lunatic Asylum, in consequence of the death of Mr. Sandon, the late Medical Superintendent, Gentlemen desirous of becoming Candidates of the Appointment, must be Members of the Royal College of Surgeons, London, and also Licentiates of the Apothecaries' Company, or Members of the Royal College of Physicians, London or Edinburgh; must have had experience in the treatment of the Insane, and the management of a Lunatic Asylum, and must not be under thirty years of age. The Salary will be £200 per annum, with Board and Residence at the Asylum.

Candidates are requested to send their Testimonials (stating age) addressed to the Committee of Visitors of the Forston Lunatic Asylum, on or before the 15th September next, under cover to Mr. John Brown, Dorchester, Clerk to the Visitors, from whom further information may be obtained. Due notice of the day and hour of Election will afterwards be given to such of the Candidates as the Committee may select for choice, and they will be informed whether their personal attendance will then be required.

Dated the 28th August, 1854.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS,

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.  
Office hours from 12 till 4.

**An unopposed Midland Village**

PRACTICE, from which the receipts, including £80 from Appointments, are about £400 annually, can be Transferred with certainty to a doubly-qualified Gentleman for £250. The country is beautiful, the roads excellent, and the work very light.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**In a favourite Metropolitan Suburb,**

an old-established GENERAL PRACTICE, now become very select, from the continued ill-health of the Proprietor is for Disposal. Receipts at present under £300 a-year, but an Introduction, that will secure the whole, will be given, with Fixtures of House and Surgery, for £300. House, nine-roomed, with Stable, at the very low rent of £50.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**Devon.—A perfectly unopposed**

PRACTICE, in a population of between 2000 and 3000, yielding £200 per annum, and at once extendible to £400, is offered, with the necessary Introduction, Drugs, Bottles, and Surgery Fixtures, for £300. A small Union Appointment is included, but no horse is necessary.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

TO SURGEONS.

**Near Eaton-square.—For Sale, price**

Four Hundred Guineas, to include Stock and Fixtures, a RETAIL BUSINESS, yielding, under the care of an Assistant, £400 per annum, and by aid of which an Extensive GENERAL PRACTICE has been formed during the last few years.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**Wanted, by an M.R.C.S. Eng. and**

L.S.A., a Situation as Visiting and Dispensing ASSISTANT. A large town preferred.—Address, Mr. R. Brown, Post-office, Glasgow, Scotland.

**Wanted, an Assistant to Dispense,**

Visit, and take Midwifery occasionally.—Address, stating age, salary, &c., to P. B. Giles, Byford-house, near Hereford.

**A Gentleman, who has matriculated**

at the London University and Apothecaries' Hall, wishes to assist a Practitioner during the hours not required for his hospital studies, in consideration of board and lodging.—Apply to Mr. Monson Hills, Guy's Hospital.

**A Gentleman, possessing both quali-**

fications, is desirous of entering into an engagement with a General Practitioner in the country as Visiting ASSISTANT. The highest references can be given.—Address, X. Y., Post-office, Ipswich, Suffolk.

**Medical Pupil.—A Surgeon con-**

nected with a London Hospital, and able to offer considerable advantages, has a Vacancy for a well-educated Youth as PUPIL. Residence close to the Hospital.—Address to M. E., at Mr. Wetton's, Stationer, 213, Oxford-street.

MEDICAL.

**For Disposal, a well-established**

GENERAL PRACTICE, in a small railway town situated in the south of Yorkshire. Such an opportunity seldom offers for the safe transfer of £250 to £300 per annum.—Address, A. Z., Messrs. Butterfield and Clark, Wholesale Druggists, York.

MEDICAL.

**Wanted, by a Young Gentleman,**

aged twenty-two years, who has completed two years' attendance on Lectures, &c., at one of the largest Metropolitan Hospitals, a Situation to Visit, Dispense, and attend Midwifery. Unexceptionable references given.—Address Medicine, Post-office, Norfolk-street, Southsea, Hants.

MEDICAL.

**To be disposed of, a General Practice**

in a large town in the North of England. House in a commanding and pleasant situation. Rent moderate. Annual return between £200 and £300. Satisfactory reasons for retirement will be given. None but principals will be treated with. Premium required, £200.—Apply to A. B., care of G. H. Swithinbank, Esq., Grafton-street, Leeds.

MEDICAL.

**The Friends of a Young Gentleman**

about to commence his Studies at one of the London Hospitals are desirous to place him with a respectable married Medical Practitioner, who will allow him to attend the Lectures, and furnish him with Board and Lodging, and treat him as a member of the family, in consideration of his partial Services and a small annual payment. He is fully competent to Visit, Dispense, and perform the difficult Operations of Surgery. An Open Surgery objected to.—Letters addressed: Medium, Mr. Barlidge's Library, Grove-terrace, Baywater.

**Medical Transfer and Partnership.**

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RELINQUISH, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

TO SURGEONS.

**Wanted immediately, a Surgeon for**

a First-class SHIP proceeding to the Colonies.—Apply to John Bonus and Son, 81, Gracechurch-street.

**Surgeon Wanted for a First-class**

Al Private Passenger SHIP, proceeding direct to New Zealand in about a fortnight. Favourable terms would be offered to a family man wishing to settle in the Colony.—Apply to F. Young and Co., 74, Cornhill, London.

TO SURGEONS.

**A Qualified Surgeon desirous of pro-**

ceeding to Australia, either to remain there or to return in the Ship, may hear of an APPOINTMENT by applying to Hall and Co., 34, Terrace, Trinity-square, City.

**A Surgeon about to go abroad will**

give up a good PRACTICE in the country, with Public Works attached, on easy terms. This Practice is within thirteen miles of Glasgow, in an excellent locality for an energetic Young Man.—For further particulars apply, by letter, to Oxonian, Herald Office, Glasgow.

**Travelling or Resident Medical At-**

tendant.—A Gentleman, aged thirty, whose education, general as well as professional, has been of a high order, and who has been some years in Practice, wishes to meet with an ENGAGEMENT. He has been several times on the Continent, speaks French fluently, and can give unexceptionable references as to character, ability, and experience.—Address, M.R.C.S., 126, Strand.

TO MEDICAL PRACTITIONERS.

**Wanted, by a Gentleman habitually**

quiet and steady, a Re-engagement as DISPENSER. He is neat and accurate in Dispensing. The highest references as to character and ability will be given.—Address, A. B., Post-office, Appleby, near Atherstone, Leicestershire.

**Medical Assistant.—Wanted by a**

Medical Gentleman in the country, a qualified ASSISTANT, to assist in Visiting and Dispensing. One accustomed to Union and Club Practice preferred.—Applications, with testimonials, to be made to A. B., Mr. Edge's Grantham.

**Wanted, for a Youth, aged 16, in**

delicate health, a comfortable Home, with cheerful companionship, preferably in a Medical Man's Family, and by the Sea-side.—Terms, which must be moderate, and full particulars, addressed, paid, to A. Z., Post-office, Highgate, Middlesex.

**Wanted, by a Single Gentleman in**

a Country Practice, an ASSISTANT, possessing the legal qualifications to Visit, Dispense, and attend Midwifery. One having had some experience in Poor-law Practice preferred. Duties not onerous. Salary £50 per annum, with a share in the Midwifery fees.—Address, Mr. Banks, Chesham, Bull Ring, Birmingham.

TO MEDICAL STUDENTS AND OTHERS.

**Apartments furnished, with attend-**

ance, in the house of a professional gentleman, in a central and agreeable part of London, close to the British Museum, and less than half-a-mile from the Middlesex, University College, Charing-cross; and King's College Hospitals. Terms average £1 per floor weekly; single rooms, 10s.—Address, 13, Caroline-street, Bedford-square.

TO SURGEONS AND OTHERS.

**Sixty-five Pounds per Annum.—To**

be LET, a Convenient ELEVEN-ROOMED RESIDENCE, in the vicinity of Bryanstone-square, well adapted for a Professional Gentleman.—For cards to view, apply to Mr. Buckland, 39, Crawford-street, Bryanstone-square.

TO SURGEONS AND CHEMISTS.

**An elegantly-fitted and well-stocked**

CHEMIST'S SHOP, with modern Mahogany and Plate-glass Front, is for Disposal, under very peculiar circumstances, which will induce the acceptance of 150 guineas down, and remainder by instalments. Its position is the centre of London, westward, and under skilful conduction, will always command a retail of £700 or £800 a-year; presenting a first-rate opening for a Surgeon to establish a Practice of large amount. Every convenience for a genteel Family, and Back-Premises adapted for a Laboratory or Dispensary.—Apply to Mr. Osprey, Auctioneer, Arbury-palace, Leicestershire.

Just published, with Maps, 8vo, cloth, 16s.

## Royal College of Physicians. —

REPORTS on EPIDEMIC CHOLERA, its Cause and Mode of Diffusion, Morbid Anatomy, Pathology and Treatment. Drawn up at the desire of the Cholera Committee. By WILLIAM BALY, M.D., F.R.S., Physician to Millbank Prison, and WILLIAM W. GULL, M.D., Assistant-Physician to Guy's Hospital.

London: John Churchill, New Burlington-street.

Just published, 8vo, price 2s.

## A Letter to the President and

FELLOWS OF THE ROYAL COLLEGE OF PHYSICIANS, in relation to the Evidence cited in their late Report on the Treatment of Epidemic Cholera. By JOSEPH AYRE, M.D., Chairman of the Sanitary Committee of the Local Board of Health.

London: John Churchill, New Burlington-street.

FRENCH ON CHOLERA.

Just published, Second Edition, 8vo, cloth, 4s.

## The Nature of Cholera Investi-

GATED. By JOHN GEORGE FRENCH, F.R.C.S., Surgeon to the Infirmary of St. James's, Westminster.

"This is one of the best treatises on cholera which we have lately read. His theory of the nature of cholera is ingenious, and is argued with acuteness." —MEDICAL TIMES AND GAZETTE.

London: John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 4s. 6d.

## Asiatic Cholera; its Symptoms,

Pathology, and Treatment. By RICHARD BARWELL, F.R.C.S., late House-Surgeon, and now Demonstrator of Anatomy, at St. Thomas's Hospital.

"The chapter on the Morbid Anatomy is very interesting. The book exhibits considerable ability." —MEDICAL TIMES.

"Here is a book well worthy of attention, for Mr. Barwell writes from the bedside of the numerous cholera patients placed under his care at St. Thomas's Hospital." —THE LANCET.

London: John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 6s. 6d.

## Change of Climate as a Remedy in

VARIOUS CHRONIC DISEASES. By D. J. T. FRANCIS, M.D. "Proceeds from the pen of a well-informed Practitioner and an accomplished gentleman, well acquainted with the subject upon which he treats." —THE LANCET.

"A very meritorious production." —MEDICAL TIMES AND GAZETTE.

London: John Churchill, New Burlington-street.

On the 1st of September was published, No. 159, price One Shilling,

## The Pharmaceutical Journal,

Containing the

TRANSACTIONS OF THE PHARMACEUTICAL SOCIETY.

CONTENTS.—The Pharmacopoeia Committee.—The School of Pharmacy: Session 1864-65.—The Cholera.—The Paris Universal Exhibition of 1865.—The British Association for the Advancement of Science: Meeting at Liverpool.—Late Hours of Business.—The Medicine Stamp and Licence Acts.—The Duties and responsibilities of the Pharmaceutical Profession.—Dalen.—The Habesha Epidemics on Monkey-Pepper—Chemical and Microscopical Examination of *Sarcina Ventriculi*.—*Atenium* and its Chemical Combinations.—Chemical Analysis of the Mineral Waters of Harrogate (continued).—Manufacture of Sulphate of Magnesia (continued).—The Trade in Cinchona Barks in Bolivia.—The Oxidation of Ammonia in the Human Body.—Process for preparing Powder of Iron.—Turf Paper.—Early Closing Association: Meeting of Chemists, &c. &c.

VOLUME XIII, may be had in boards, as well as the preceding volumes, price 12s. 6d. each.

London: John Churchill, New Burlington-street; MacLachlan and Stewart Edinburgh; and Fannin and Co., Dublin.

Third Edition, with 120 Illustrations on Steel and Wood, 8vo, cloth, 22s.

## The Principles and Practice of

OBSTETRIC MEDICINE AND SURGERY. By F. H. RAMSBOTHAM, M.D., Physician to the Royal Maternity Charity.

"This new edition of Dr. Ramsbotham's work forms one of the most complete and thoroughly useful treatises on midwifery with which we are acquainted. The entire work has undergone a careful revision, with additions. We have already given specimens of the work sufficient to justify our hearty recommendation of it as one of the best guides that the student or practitioner can follow." —BRITISH AND FOREIGN MEDICAL REVIEW.

"It is the book of midwifery for students—clear, but not too minute in its details, and sound in its practical instructions. It is so completely illustrated by plates, (admirably chosen and executed), that the student must be stupid indeed who does not understand the details of this branch of the science, so far at least as description can make them intelligible." —DUBLIN JOURNAL OF MEDICAL SCIENCE.

"This is one of the most beautiful works which have lately issued from the medical press, and is alike creditable to the talents of the author and the enterprise of the publisher. As a work conveying good sound practical precepts, and clearly demonstrating the doctrines of obstetrical science, we can confidently recommend it either to the student or practitioner." —EDINBURGH JOURNAL OF MEDICAL SCIENCE.

"This book forms a very handsome volume. Dr. Ramsbotham has treated the subject in a manner worthy of the reputation he possesses, and has succeeded in forming a book of reference for practitioners, and a solid and easy guide for students. Looking at the contents of the volume, and its remarkably low price, we have no hesitation in saying that it has no parallel in the history of publishing." —PROVINCIAL MEDICAL AND SURGICAL JOURNAL.

London: John Churchill, New Burlington-street.

Just published, with Plates, 8vo, cloth, 10s. 6d.

## On some Diseases of Women

ADMITTING OF SURGICAL TREATMENT. By ISAAC BAKER BROWN, Surgeon-Accoucheur to St. Mary's Hospital.

"The most valuable chapter in the book is that on Ruptured Perinæum. It is in the treatment of this distressing accident, which has long held a prominent place amongst the opprobria of Surgery, that Mr. Brown has, in our opinion, shown the greatest amount of originality, and in which his efforts have been rewarded with the greatest success." —THE LANCET.

London: John Churchill, New Burlington-street.

Just published, post 8vo, 1s. 6d.

## On the Triple Aspect of Chronic

DISEASE; having especial reference to the Treatment of Intractable Disorders chiefly affecting the Nervous and Muscular System. By WILLIAM BAYES, M.D., Licentiate of the Royal College of Physicians, and Physician to the Brighton Dispensary.

London: John Churchill, New Burlington-street.

Just published, Third Edition, entirely rewritten, 8vo, cloth, 10s.

## The Modern Treatment of Syphilitic

DISEASES, both Primary and Secondary; comprising the Treatment of Constitutional and Confirmed Syphilis by a Safe and Successful Method. By LANGSTON PARKER, Surgeon to the Queen's Hospital, Birmingham.

London: John Churchill, New Burlington-street.

Just published, Second Edition, 8vo, cloth, 6s.

## On Indigestion, and Certain Bilious

DISORDERS often conjoined with it. To which are added, Short Notes on Diet. By G. C. CHILD, M.D., Consulting Physician to the Westminster General Dispensary.

"Evidently written by one who has seen much and observed well." —AMERICAN JOURNAL OF THE MEDICAL SCIENCES.

"There is evidence that the author unites experience, study, and reflection." —SCHMIDT'S JAHREBUCHER.

London: John Churchill, New Burlington-street.

Just published, 8vo, price One Shilling,

## Painless Tooth-Extraction, without

CHLOROFORM; with Observations on Local Anæsthesia by Congelation in General Surgery. By WALTER BLUNDELL, Surgeon-Dentist.

London: John Churchill, New Burlington-street.

WORKS BY MR. COULSON,  
SURGEON TO ST. MARY'S HOSPITAL.

## On Lithotomy and Lithotomy; with

Engravings on Wood. 8vo, cloth, 8s.

"The most complete monograph upon the subject which has yet appeared in our language." —ASSOCIATION MEDICAL JOURNAL.

II.

## ON DISEASES OF THE BLADDER AND PROSTATE

GLAND. The Fourth Edition, revised and enlarged. 8vo, cloth, 10s. 6d.

"Mr. Coulson's work may be stated to be full and practical, to fill a vacant space in medical literature, and to be highly valuable to both students and practitioners." —MEDICAL TIMES.

"The practical and comprehensive character of Mr. Coulson's volume claims for it a place in the library of every surgeon who desires to be on a level with modern improvements." —LONDON JOURNAL OF MEDICINE.

London: John Churchill, New Burlington-street.

WORKS ON CHEMISTRY.

## Abel and Bloxam's Handbook of

CHEMISTRY: Theoretical Practical, and Technical. 8vo, cloth, 15s.

BOWMAN'S PRACTICAL CHEMISTRY, including ANALYSIS; with numerous Engravings on Wood. Second Edition. Fcap. 8vo, 6s. 6d.

BOWMAN'S HANDBOOK OF MEDICAL CHEMISTRY With numerous Engravings on Wood. Second Edition. Fcap. 8vo, 6s. 6d.

FRESENIUS' INSTRUCTION IN CHEMICAL ANALYSIS.

QUALITATIVE. Third Edition. 8vo, 8s.

QUANTITATIVE. Second Edition. 8vo. (Just ready.)

FOWNES' CHEMISTRY, AS EXEMPLIFYING THE WISDOM AND BENEFICENCE OF GOD. Second Edition. Fcap. 8vo, 4s. 6d.

This day is published, price 3d., No. 11, of

## The Epitomist, a Weekly Journal of

Literature, Criticism, Art, Science, and Manufactures; comprising Fiction of the highest class, Reviews of new Works, all the Scientific Intelligence of the week, a list of Patents, with abstracts of Specifications, a Domestic Miscellany, and Correspondence; 32 pages, 8vo.

Office, 49, King William-street (City), London.

Order of all Booksellers and News-vendors in the Kingdom.

### POPULAR MUSIC.

## Hamilton and the Piano.—

Sixty-two large music folio pages, price 4s.; Hamilton's Instructions for the Pianoforte, 50th edition, newly revised and greatly enlarged by Carl Cserney, pupil of Beethoven; also, Hamilton's Modern Instructions for Singing, large music folio, 6s.

### NEW BALLADS.

MARY ASTORE. Ballad. Words by Mrs. CRAWFORD. Music by STEPHEN GLOVER. 2s. This exquisite and highly popular ballad, as sung by the first of English vocalists, Miss Dolby, has always excited a warm demonstration, accompanied with a recital.

THE SWEET VESPER BELLS OF ANCONA. Ballad. Written and composed by JOHN PARRY, and illustrated with Reminiscences of Ancona, after a sketch from the Composer's own Portfolio. 2s. 6d. This admired song is altogether one of the happiest conceptions of this gifted favourite of the public.

CHIME AGAIN, CHIME AGAIN, BEAUTIFUL BELLS. Ballad. 2s. A charming memento by a young lady quitting the shores of her native land, on hearing the distant sound of village bells, recalling many endearing thoughts of those whom she was leaving behind.

ANNIE O' THE BANKS O' DEE. Song. Words by Mrs. CRAWFORD. Music by STEPHEN GLOVER. There is a dreamy sweetness about this favourite ballad, which, combined with its facility and easy flow of melody, charms alike the listener and the performer.

EXCELSIOR. Song. Words by LONGFELLOW. Music by Miss M. LINDSEY. Finely illustrated. 2s. 6d.

"The theme is tenderly and powerfully conceived. It is an exquisite lyric."—See Eliza Cook's Journal, June 17.

FADING AWAY. Song. Written and composed by Miss ANNE PRICKER. 2s.

"There is a touching sentiment in this song quite removed from triteness. The air and the words seem to have been born together, so well are they matched."—Eliza Cook's Journal.

TRUTH IN ABSENCE. Canzonet. Composed by EDMUND B. HARPER. Price 2s.

"It is a most charming canzonet, and so captivated are we by it, that we have been deaf to the wishes of a particular friend who has positively asked for it. The melody is purely beautiful, and must charm all who hear it."—Eliza Cook's Journal.

London: Robert Cooks and Co., New Burlington-street; and of all musicsellers.

## If you require Family

ARMS, send Name and County to the HERALDIC OFFICE. Fee for Search and Sketch, 3s. 6d., or postage-stamps; Crest Engraved on Seal, Signet Rings, &c., 8s. 6d.; Arms, with Name, on plate, for books, £1 1s.; Arms Painted, Empalmed, and Quartered.

TESTIMONIALS, Memorials, Addresses, and Votes of Thanks written, illuminated, and Emblazoned on Vellum.

H. SALT, Lincoln's-inn Heraldic Office, Great Turnstile, Lincoln's-inn-fields.

## H Silverlock's Medical Label Ware-

house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

## Allen's Illustrated Catalogue, con-

taining size, price, and description of upwards of 100 articles, consisting of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes, Writing-desks, Dressing-cases, and other travelling requisites, forwarded on receipt of two stamps.

ALLEN'S TRAVELLING-BAG (patented) has the opening as large as the bag itself, and therefore possesses an immense advantage over all others.

ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK, and their New Quadruple Portmanteau (containing four compartments), are the best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Barrack-room Furniture, and Military Outfitters, (see separate Catalogue,) 19 & 23, WEST STRAND.

## Mayall's Daguerreotype Portrait

GALLERIES, 224, Regent-street, (corner of Argyle-place), and 433, West Strand.

Mr. Mayall begs to invite inspection of his extensive collection of DAGUERRETYPE PORTRAITS OF EMINENT MEDICAL, SCIENTIFIC, and LITERARY MEN, Panoramas from Nature, and Views of the late Exhibition; together with specimens of every improvement in the art. The originals of THE LANCET PORTRAITS on view.

## The Pen Superseded.—The most

elegant, easy, economical, and best method of MARKING LINEN, Silk, Books, &c., without the ink spreading or fading, is with the INCOBODINE ARGENTINE PLATES. No Preparation required. Any person can use them with the greatest facility. Name, 2s.; Initials, 1s. 6d.; Numbers, per set, 2s. 6d.; Crest, 5s. Sent, post free, with directions, for stamps or post-office order.

FREDK. WHITEHEAD, Inventor and Sole Maker, 10, Little Queen-street Holborn.

## Pure Coco-Oleine, as prepared by

PRICE'S PATENT CANDLE COMPANY, for use at the Hospital for Consumption, Brompton. It has no unpleasant smell or taste, and is sold at about half the price of Cod-liver Oil, for which it often proves an efficient substitute. It may now be had in sealed quart and pint bottles, from all retail chemists and druggists, and wholesale from the principal wholesale druggists, and from Price's Patent Candle Company, Belmont, Vauxhall, London.—Imperial Quarts, 3s. 6d.; Imperial Pints, 2s.

## W Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible: also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyocymus Niger, Conium Maculatum, Atropia, Belladonna, Crotalaria Umbellifera, &c.); also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alterative), Liq. Parietariae (diuretic), and Liq. Belce (prepared from the Eggle Marmelos, or Indian Bael), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BAEI on hand.

2, Edwards-street, Portman-square.

## By Her Majesty's Royal Letters

PATENT.—T. MAYO, WATSON, and CO., 2, BERNERS-STREET, OXFORD-STREET, LONDON, Manufacturers of Mineral Erased Water, and Patentees of the Syphon Vase and Valvular Stopped Bottle. The objection so generally made to the common soda-water bottle, in the inconvenience attending its being opened, has induced Messrs. T. Mayo, Watson, and Co., in addition to the Syphon Vase to introduce the VALVULAR STOPPED BOTTLE, whereby the annoyance complained of is removed, the use of both corks and wire being dispensed with, and the advantages arising to those who are in the habit of drinking erated waters (more especially ladies and invalids) greatly enhanced, from the circumstance that any quantity, however small, can be withdrawn, whilst, at the same time, the portion remaining in the bottle retains its gaseous properties unimpaired. Applications having been made to them for agencies for the sale of the Syphon Vase and Valvular Stopped Bottle, Messrs. T. Mayo, Watson, and Co. have now made arrangements accordingly, and will be happy to treat with parties desirous of becoming agents.

### TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lytta P.L., easily applied and removed, and will not produce strangury or troublesome after-effects. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1852.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction."

60, Grosvenor-street, London.

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. BROWN'S BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Strangury.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 42, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

## Digitized by Google

## Warming and Ventilating, by Hot

AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOILESSVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment.—

Barbiston House Worcestershire, March 1st, 1884.

SIR,—I am much pleased in being able to give you a justifying account of your Calorifere. Since I burn nothing but coke in it, the change has been quite surprising. I must say, that now I have a very high opinion of your machine, and find it a great comfort in my house, the cost of warming it was one shilling per day.

To J. Boilessve, Esq.

WM. SMYTH, (Sir, Baronsd.)

## Purification of Linen—Prevention of

Disease.—J. BOILESSVE, 55, King William-street, City, London, solicits the attention of the nobility and gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1883.

SIR,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) put up in the Laundry at Woburn Abbey in May, 1882, by Mr. Boilessve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy; I sent to the Laundry for the man who has the management of it, and he says, that they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.

I am, Sir, your obedient servant,

J. Boilessve, Esq.

J. PALFREMAN, House Steward.

## Every excellence which the

Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c.

H. and Co. have much pleasure in informing the Profession that they have perfected an ABDOMINAL BELT of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 18s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stocking: Circumference at A, B, C, D, and E; length from A to D, and D to E.

HUXLEY and CO., 8, Old Cavendish-street, late 5, Vere-street, Oxford-street.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1. KNEE-PIECE AND ANKLE-PIECE.—Mr. Bourjeaud begs to state that these may be worn together or separately. The former is especially useful in chronic enlargement of the knee-joint, weakness in the articulation, &c. &c.; and the latter should always be used after the subsidence of the inflammatory stage in sprains, dislocations, &c. &c.

FIG. 2. MR. BOURJEAUD'S REGISTERED ELASTIC STOCKINGS acting Spirally, free from Seams, requiring no Laces, and put on with the greatest ease.—

These stockings constitute one of the greatest improvements of modern times in appliances for compression, and Mr. Bourjeaud is happy to say, that the Medical Profession in London and the Provinces have pronounced them the most efficient that have ever been produced. They are made of most carefully-prepared webbing of varying elasticity, and disposed in stripes running spirally round the leg, and the amount of pressure may thus be regulated to a nicety. The elastic force is accurately calculated, and adapted, upon the directions of the medical attendant, to the different pathological states of the ankle, leg, knee, or thigh, requiring gentle and equable pressure. The stockings are put on without the slightest effort, from below upwards, and thus possess the advantage of driving the blood from the vessels before the pressure is exerted; no tedious lacing is required, and hence there is no risk of congestion of the head and unpleasant swelling of the legs consequent upon stooping. Patients afflicted with oedema of the lower extremities, varicose veins, enlargement or weakness of the knee or ankle, should wear none but these stockings; they are invaluable in all cases requiring compression, which latter may be made more or less powerful through the whole length, or only on a given spot, to answer the various indications which the surgeon wishes to fulfil.

The Stockings are to be obtained only at 11, Davies-street, Berkeley-square, opposite Mivart's Hotel.

## Mr. T. H. Wakley's Stricture Instru-

MENTS. Complete Sets of these Instruments may now be had of WEISS & SON, 62, Strand, London.

## New Urethrotome, by Mr. Ure,

Surgeon of St. Mary's Hospital, described in THE LANCET of June 10th. —Manufactured only by PRATT, Surgical Instrument Maker, 420, Oxford-street. The cheapest House for Elastic Stockings, Trusses, &c. Wholesale and Retail.

TO THE MEDICAL PROFESSION.

## Fr. G. Ernst, Anatomical Machinist

and MANUFACTURER OF SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Biding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam EMMET (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

TO THE SURGICAL AND MEDICAL PROFESSION.

## W. F. Duroch, late Smith, begs to

\* inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas's-street, (near the Hospital), in Southwark. Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.

SPECULUM ANI, made by W. Duroch, for John Hilton, Esq., may be had at a moderate price.

## Surgical Instruments, and every

Implement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), Retail as well as Wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholemew's Hospital, London.

## India-rubber Urinals for Male and

FEMALE RAILWAY TRAVELLERS AND INVALIDS.

No. 1.

No. 2.

URINAL FOR TRAVELLING.  
Price 15s. and 18s.

The above Urinals are made on the most approved principles, and are all fitted with the recently-invented valve, which will not allow any return of the water by the upper part, by being placed in any position, and from their construction prevent the objectionable smell complained of in those of other Manufacturers.

Manufactured by W. S. SPARKS, 115, New Bond-street, London.  
A liberal discount allowed to the Medical Profession.

## Mineral Waters.—W. Best begs to

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seltitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-de-Cologne, Arguebuzard, and Foreign Mineral Water Depot, 22, Henrietta-street, Cavendish-square.—N.B. Balls and evening parties supplied with German and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

## Struve's Seltzer, Fachingen, Vichy,

and other MINERAL WATERS. Under her Majesty's special patronage.—ROYAL GERMAN SPA, BRIGHTON. The Pump-room and Promenades, offering every facility for a Course of Mineral Waters as perfect and beneficial as at the natural springs, are NOW OPEN for the 30th Season. Orders for Struve's Bottled Mineral Waters continue to be executed by George Wagh and Co., Chemists to the Queen, 177, Regent-street (west side), London, and by numerous other respectable houses in London and the provincial towns, where a printed account of Struve's Mineral Waters may be obtained gratis.

CAUTION.—Struve and Co. have no connexion with waters advertised under the general designation of "Brighton Seltzer," "Brighton Fachingen," &c., and every genuine bottle of Struve's Waters has the name of "Struve" on the label, as well as on both sides of the red-ink stamp over the cork, having the words "Royal German Spa, Brighton," under the Royal Arms.

## Dinneford's Pure Fluid Magnesia,

now greatly improved in purity and condensation.

"Mr. Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—PHARMACEUTICAL JOURNAL, May, 1846.

This excellent remedy, in addition to its extensive and increasing sale amongst the public, is now very largely employed in DISINFECTING for which the cheapest and most convenient form is in the SPOON JARS; half-gallon, 5s. 6d.; gallon, 9s. 6d.; specially adapted for the use of Surgeons and Chemists. To be had from the manufacturers, DINNEFORD & CO., Chemists, 172, Fleet-street, London; and all respectable Wholesale Druggists and Patent Medicine Houses.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 29th, 1864.) Davenport's Preparations specially referred to are as under:—

Preserved Juices. Dose, one to three drachms; 5s. 4d. per lb.  
Impregnated Juices. Dose, half a drachm to a drachm; 16s. per lb.  
Solid Extract. Dose, five to fifteen grains; 20s. per lb.  
TARAXACUM (Davenport's) LIQUOR, or FLUID EXTRACT, prepared by Spontaneous Impregnation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

IMPORTANT TO THE MEDICAL PROFESSION.

## Davenport's Syrup of the Iodide of QUININE AND IRON.

FROM DR. GOLDING BIRD.

"49, Russell-square.

"I have now for some time employed pretty largely the triple Compound of Iodine, Quinine, and Iron, prepared by Mr. John T. Davenport, in the form of Syrup. I do not hesitate to express my opinion of its great value as a therapeutic agent. It has appeared to me that the Quinine assisted the assimilation of the Iron, and I have found it to be of very great value in cases in which the use of the Iodide of Iron is recognised. This triple Compound possesses many advantages over the simple Iodide, and not the least of them is the satisfactory manner in which it is tolerated by the stomach, especially if administered (as all preparations of Iron ought to be) immediately after a meal.

"GOLDING BIRD, A.M., M.D., F.R.S.

"Fellow of the Royal College of Physicians,

"Physician and Professor of Materia Medica, at Guy's."

FROM DR. GEORGE P. MAY.

"Having for some time past extensively used the ternary Compound of Quinine, Iodine, and Iron, prepared by Mr. J. T. Davenport, I can with confidence testify to its marked efficacy in cases of Struma and Anæmia, and, indeed, in all instances in which the exhibition of Iron and its Compounds is indicated. This preparation appears to combine all the therapeutic powers of its constituents, without their nauseous qualities, which renders it an admirable medicine in the treatment of some of the disorders of Childhood.

"Maiden.

"GEO. P. MAY, M.D."

SYRUP OF THE IODIDE OF ZINC, as prepared for Dr. Barlow, of Guy's Hospital.

TARAXACUM (Davenport's) LIQUOR, or FLUID EXTRACT, prepared by Spontaneous Impregnation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm. 6s. per lb.

CITRATE OF QUININE AND IRON, 25 per cent. of Quinine. 4s. 6d. per oz.

SYRUP OF THE IODIDE OF IRON (P.L.), 3s. per lb.

ELMECONITE SOLUTION OF OPIUM. Professional testimonials acknowledge this preparation to be the most efficient sedative extant. The unpleasant effects of ordinary opiates are entirely obviated. Dose, 15 to 30 Drops. 8d. per oz.

COTTLEDON UMBILICUS. The Solid and Fluid Extracts, 1s. 3d. and 1s. per oz. also the Preserved Juice, 5s. 4d. per lb., as recommended by Mr. Seltzer, (of Poole,) in Epilepsy.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, GREAT RUSSELL-STREET, BLOOMSBURY.

GREAT REDUCTION IN PRICE OF

## Sir William Burnett's Disinfecting

FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d.

This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street, London-bridge.—N.B. Beware of a spurious imitation.

## The Cholera Prevented by the

destruction of all noxious effluvia.

CREWS'S DISINFECTING FLUID. Recommended by the College of Physicians. The cheapest and strongest CHLORIDE OF ZINC.

Quarts, 2s.; Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED. FURTHER GREAT REDUCTION IN PRICE.

## Crews's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crews's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 6s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

DOUBLE PATENT.

## Briet's portable Gazogène, OR SODA-WATER APPARATUS,

for the immediate production of Soda-water, Ginger-beer, sparkling Wine, Lemonade, &c. &c.

SPECIAL POWDERS for generating Gas in the same, cheaper and more effective than any other preparation.

SELTZER POWDERS, prepared from a recent analysis of the fresh water from the spring by a celebrated German chemist.

PATENT REFRIGERATOR, or Gazogène-Cooler.

PATENT PORTABLE FILTER, a cheap and useful article, not occupying more than four to six inches in space, and filtering from six to ten gallons per twenty-four hours, suitable for Military, Navy, and Travellers in all Climates.

Sole Wholesale Agents, GEBHARDT, ROTTMANN and Co., 21, Bartlett's-buildings, Holborn, London.

NOTICE is hereby given, that proceedings will be adopted against all parties selling or exposing for sale the imitations of the above-named articles, as the said imitations are infringements upon these patents.

## Hare-Lip.—Extraordinary Application and CURE.

Communication from Mr. BROADBENT, Surgeon, Ferry Hill, Durham.

MR. BENJAMIN NICKELS,

SIR,—I wish to state concerning your Plaster to the following effect. About ten days after an operation for Hare-lip, the boy fell against a stone step and ruptured the lip. The day previously I had received your Elastic Plaster, and on being summoned to the boy, (without much hope of success,) I applied three strips of the Plaster, extending from ear to ear, bringing the ruptured edges into apposition. Seven days after, the Plaster retained the cheeks in the position I had left them on the day of application. Fresh strips were then applied, and the edges ultimately united. In my opinion, no other plaster could have answered the intention, and I think it specially adapted to wounds on the face.

I remain yours obediently.

(Signed)

G. W. BROADBENT.

NICKELS'S PATENT ELASTIC ADHESIVE PLASTER, and ELASTIC ADHESIVE BANDAGES, which are made on quite a new principle, rendering them a cheap, efficient, unvarying support as a spiral covering, or stocking (without the trouble of lacing), for varicose veins, sprains, weak joints, and all rheumatic affections. These Bandages may also be cut and applied as ordinary strapping.

The Patentee has had the honour of receiving the highest testimonials in approbation of his ELASTIC PLASTERS from the following most eminent Members of the Profession, and many other Gentlemen, by whom they are patronized and used in their hospital and private practice:—J. C. W. LAYNE, M.D., Physician Accoucheur, Guy's Hospital. Mr. FERGUSON, Surgeon to his Majesty's Highness Prince Albert, Prof. Surgeon, King's College, London; Surgeon King's College Hospital. Mr. HILTON, Surgeon, Guy's Hospital, Surgeon to the City of London Hospital for Diseases of the Chest.

THE PATENT ELASTIC COURT PLASTERS are found most superior both in appearance and quality.

Sold by all principal Chemists in the United Kingdom, and by Mr. BENJAMIN NICKELS, Surgical Plaster Manufacturer, 9, Camberwell-green, London.

# Anglo - Australian and Universal FAMILY LIFE ASSURANCE COMPANY.

Incorporated under Act of Parliament, 7 & 8 Vict. cap. 110.

For Granting *Infantile, Adult, and Matrimonial Assurances, Annuities, Endowments, Loans and Guarantees; and for the Purchase of Reversionary Property, Life Interests, &c.*

With special application to **INFANTS, EMIGRANTS, and GOLD MINERS.**

Seventy-five per cent., and eventually 100 per cent., of the entire profits divided on a new and most equitable principle among the Members.

CAPITAL FUND £150,000, IN 15,000 SHARES OF £10 EACH.

First Call £1 per Share. The paid-up portion of the Capital, with its accumulations, to bear a Dividend at the rate of not less than £5 nor more than £10 per cent. per annum, with a Bonus of 25 per cent., of the Profits.

No Commissions paid to Agents or others. No Premiums forfeited through inability to continue them.

LONDON OFFICES: 5, CANNON STREET WEST, CITY.

## TRUSTEES.

SOLICITORS—Messrs. Beddome and Weir, 27, Nicholas-lane, City.

ACTUARY—Tobias Pepper. SECRETARY—John Newton, Esq.

This Company has not been established as a rival to other Assurance Societies, as there are none at present founded which comprise its peculiar objects. Its design is original, and is intended to supply an extensive vacancy in the application and practice of Life Assurance, by the introduction of new and highly important features, of great practical utility, for which there is a large and untried field of operation, not only in England, but also in Australia.

The operations of the Company will embrace every improvement calculated to be permanently beneficial to its members; and at the same time that its constitution will protect all holders of policies from every species of liability and loss, through the guarantee afforded by an ample Capital Fund, its practice cannot fail to secure popular favour, and will be productive of immense benefits, not only to the Shareholders, but also to the Assured.

Particular attention is earnestly requested to the system of granting Annuities and Assurances on *Infant Lives*, originated by this Company, and now in full operation; by which system, in addition to the general classes of Annuities and Assurances, parents or guardians can provide at a small cost for the education, endowment, marriage portions, and placing out in life of children; at the same time that should death occur before any given age, the whole of the premiums will be returned.

The chief objects of the Company are comprised under seven principal departments, viz.—1. Infant Assurance; 2. General Assurance; 3. Emigration Assurance; 4. Australian Assurance; 5. Gold Mining Assurance; 6. Guarantee Assurance; 7. Universal or Whole World Assurance.

A brief summary of some of the advantages offered is presented below:—

1. Assurances and Annuities, specially adapted to educational and other purposes, granted on *INFANT LIVES*, from the age of three months to fourteen years.

2. Premiums for all Deferred Assurances, Annuities, and Endowments, RETURNED IN FULL on death before the given age.

3. All Infant Assurances effected under ten years of age carry Universal Policies.

4. Reversions, Life Interests, and Policies, purchased at their full value.

5. Assurances and Annuities of every description granted on *ADULT LIVES*, from fifteen to ninety-five years of age.

6. Profits determined and distributed amongst Policy Holders upon a new and most equitable plan.

7. All Policies of this Company rendered safe by a valuable principle of indisputability.

8. Loans granted, upon personal and other security, on an improved system.

9. No charge for Policy Stamps, nor for Medical Fees.

10. Policies granted from £25 to £15,000, and made payable to Registered Holder.

11. Invalid and Diseased Lives Assured upon an equitable principle.

12. An Invalid Fund, for granting Free Annuities to afflicted Policy Holders.

13. Premiums payable in one or more fixed sums, or by yearly, half-yearly or quarterly payments.

Proposals for Assurance, Prospectuses, and further information, can be had on application to

JOHN NEWTON, Secretary.

N.B.—The attention of the Medical Profession is particularly invited to a consideration of the liberal dealing of this Company towards the Profession.

CAPITAL:—ONE MILLION STERLING.

THE WHOLE PAID UP AND INVESTED FOR HALF A CENTURY.

# Globe Insurance,

CORNHILL AND PALL MALL, LONDON.

ESTABLISHED 1808.

FIRE: LIFE: ANNUITIES: REVERSIONS.

JAMES W. FRESHFIELD, Esq., M.P., F.R.S., Chairman.

POWELL NEWSAM, Esq., Deputy-Chairman.

GEORGE CARR GLYN, Esq., M.P., Treasurer.

The NEW TABLES adopted by the GLOBE include two Scales of Life Premiums, *Participating* and *Non-Participating*, combining, with moderate rates, those principles of solidity and security which have distinguished this Company from its formation.

Two-thirds of profits apportioned as Bonus.

One-third of the Premium may remain *Unpaid* as a debt upon the Policy.

Facilities afforded to Insurers.

Insurances to the extent of TEN THOUSAND POUNDS on a single approved Life.

Every class of FIRE and LIFE Insurance business transacted.

Prospectuses, with full Tables and Details, and Forms, may be had at the Company's Offices, or of the Agents.

WILLIAM NEWMARCH,  
Secretary.

## Teeth.—Mr. Alfred Jones, of Gros-

venor-street, has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

## Asthma, Chest, and Throat Affec-

TIONS.—Immediate Relief and Effectual Cure by Markwick's Patent 2s. 6d. Respirators, Cholera Belts, Chest Protectors, &c.

GOUT, RHEUMATISM, and LUMBAGO.—For a speedy Cure, use Markwick's Patent Piline Gout Socks and Gloves, Knee and Shoulder Caps, Lumbago Bands, &c.

SHOE SOCKS, of Markwick's Patent Piline, surpass every other for comfort; being waterproof, you are also protected against damp.

MARKWICK'S PATENT SPONGIO-PILINE POULTICE or FOMENTATION, is invaluable for its extraordinary efficacy, easy application, cleanliness, and durability.

G. TRIMBEY, sole Manufacturer, Queen-street, Cheapside, London. Sold retail by all respectable Chemists and Druggists.

## Mr. Hooper's Water Mattresses or

BEDS, and CUSHIONS for AIR or WATER, for placing on an ordinary Bedstead. Being made of India-rubber, without the admixture of cloth materials, leakage is avoided. (Extract from THE LANCET, Jan. 26, 1861.)

CUSHIONS FOR BED-SORES.—Whether threatened with Sloughing, or in which Sloughing has taken place, Fractures, Diseased Joints, Spasms, Lassitude, Typhoid and other Fevers, Rheumatic Affections, Dropsy, Coldness of the Stomach and Feet, Consumptive and all Bed-ridden Patients. They are simply to be placed on an ordinary bedstead. These Cushions and Beds are not affected by Heat or Cold, and will bear water at any temperature.

Finsbury-square, February 27, 1863.

I have in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water Bed.

JOHN PERRIER, M.D., Physician to the London Hospital.

Infirmary, Chichester, March 21, 1863.

Sir,—We are all much pleased with your Cushions, and still more so with the Mattresses.

Yours truly,

THOS. NEWHAM, House-Surgeon.

HOOPER, 7, PALL MALL EAST, and 65, GROSVENOR-STREET.

# A Course of Lectures ON DISEASES OF THE EYE,

*Delivered at the Medical School of the London Hospital.*

By GEORGE CRITCHETT, Esq., F.R.C.S.,

SURGEON TO THE ROYAL LONDON OPHTHALMIC HOSPITAL; LECTURER ON  
SURGERY AT THE LONDON HOSPITAL, ETC.

## LECTURE VIII.

*Affections of sclerotic and iris: "sclero-iritis;" "iritis;" reasons for not considering "scleritis" a separate disease; peculiar affection described by Mr. Dalrymple. "Sclero-iritis," or "rheumatic iritis;" age most liable; symptoms; local; character of the pain; appearance of the eye; arrangement of vessels; state of the iris; constitutional symptoms; rheumatic diathesis; causes; prognosis; liability to relapse; treatment; constitutional; very diversified in different stages; local treatment; question of belladonna; order in which remedies should be used; catarrhal complication.*

HAVING now described the more common and important diseases of the conjunctiva and cornea, I pass on, in pursuance of the anatomical arrangement which I have adopted, to the consideration of the affections of the sclerotic and iris, and, inasmuch as they possess a close vascular connexion, and as the former is never the seat of inflammation without the latter becoming involved, I merely propose making two sub-divisions; one in which the sclerotic is primarily and chiefly affected, and the iris only in a secondary and minor degree, which is termed "sclero-iritis," or sometimes "rheumatic iritis;" and the other in which the evidences of morbid action are chiefly seen in the iris, which is termed "iritis." I am aware that most systematic writers describe "scleritis" as a separate disease, and it would therefore be presumptuous in me to deny its existence, but I have never been able to make it out from personal observation, and as I am anxious to offer to you only that which I have ascertained and verified by my own experience, I do not feel it to be in accordance with the plan of these lectures to copy the description of this disease that is to be found in books. I feel assured that if it were a well-marked and not very uncommon form of inflammation, it would have come before my notice, more especially as I have carefully looked for it. I am therefore inclined to think that in some cases an over-minute anatomical sub-division of disease, aided by a vivid imagination, has led to the creation of an affection that has no real existence, or that another disease has been mistaken for it. I believe this to have been the case with Mr. Tyrrell: he describes the sclerotic as affected in parts, and as presenting pink patches beneath the conjunctiva, and to this he gives the term of "scleritis." I have frequently observed this disease, and have alluded to it when speaking of pustular ophthalmia. I believe it to be an affection of the sub-conjunctival fascia or cellular membrane; it occurs in a patch of a pinkish colour on the anterior part of the sclerotic, has a raised and thickened appearance, and is seen just beneath the conjunctiva. On making slight pressure, the vascular elevation may be emptied and seen to refill; it is usually attended with a dull, aching pain, and a feeling of distress and weakness, and increased lachrymation; it is generally limited to one part of the eye, and in the cases that I have seen it has been situated about the spot indicated by the insertion of the external rectus muscle.

I have usually found this disease very persistent, and disposed to remain in *statu quo*; it does not extend beyond its original seat, nor does it in any way damage the eye, and at the end of a certain period, varying from weeks to months, it subsides. I have not been able to trace any marked influence from any plan of treatment, either constitutional or local. I have always regarded it as dependent upon some constitutional cause, and as analogous to those indurated deposits that take place in the sub-cutaneous cellular tissue in various parts of the body in feeble constitutions. I feel satisfied that the sclerotic coat is not involved, because the more characteristic signs of inflammation of this part are wanting, and because it is at variance with all analogy to find a fibrous tunic inflamed partially and in patches.

Before I commence the description of "sclero-iritis," I desire briefly to notice an affection that has been described by my late friend and much respected colleague, Mr. Dalrymple, in No. 1619.

his valuable work, "On the Pathology of the Human Eye." It appears that the curious and rare disease that I now propose to notice was first described by Monsieur Sichel, of Paris; it was supposed by that distinguished oculist to originate in the choroid coat, and by Mr. Dalrymple in the sclerotic; and seems to consist of a partial inflammation near the margin of the cornea, the result of which is a circumscribed accumulation of fluid, that gradually shows beneath the conjunctival membrane. The description given by Mr. Dalrymple is so graphic and so exactly accords with a few cases that have come under my own observation, that I feel I cannot do better than quote his words. After alluding to the account given by Monsieur Sichel, he proceeds as follows:—"For my own part I believe the original seat of the disorder is in the sclerotic, and that the subsequent phases are due to inflammation advancing to contiguous textures, both internal and external; and that, in fact, an infiltration of tubercular matter takes place in the sub-conjunctival cellular tissue, as well as exudation between the sclerotic and choroid within, the most usual situation being about the 'corpus ciliare.' When this effusion has taken place, we see the pupil drawn towards the seat of the disease; and if it be not irregular it is at least eccentric. The iris also sometimes participates partially in the inflammation, as is shown by change of colour; still later in the disease the cornea itself becomes opaque in the vicinity of the sub-conjunctival swelling, and its tissue seems to become softened and swelled, and the opacity assumes a pale buff colour, without, however, distinct vessels pervading it. This degeneration of tissue is apt to spread, and in some cases almost surrounds the cornea. The vision is much less disturbed for a considerable time than might have been expected, and when opacity of the cornea does not exist, is but little troubled, showing how circumscribed is the internal implication of the choroid, and how limited is the pressure of the effusion. Pain is a variable symptom: sometimes in the first activity of the disease it is sufficiently acute, chiefly of a neuralgic character, and radiating, as in rheumatic scleritis, to the frontal and sub-orbital nerves; sometimes it is of a less severe kind, and gives rise to a sense of distension of the globe, and of stiffness in the movements of the organ; there is some amount of intolerance of light, and the constitutional symptoms are more or less indicative of a strumous cachexia with little or no febrile excitement. This malady is usually seen in young adults of a strumous diathesis, and in girls often associated with a disturbance of the catamenial function." Mr. Dalrymple goes on to mention the extreme obstinacy of this disease, and in allusion to some cases that had come under his notice, after having seen all the more active remedies carefully and perseveringly employed for a considerable period in vain, at length found benefit from the use of turpentine; he also recommends liquor potassæ, bark, and colchicum.

A case occurred to me at the Ophthalmic Hospital, about four years ago, that so exactly resembles the above description that it might have sat for the portrait. The patient was a young married female, tall, pale, and of a lax fibre; she had been for some time under one of my colleagues, and, in consequence of his accidental absence, came under my notice. I should only be recapitulating the above account were I minutely to describe her case; I may, however, mention that all useful vision had been destroyed in one eye by a previous attack, there being considerable opacity of the cornea, and staphyloma both of cornea and sclerotic. In the other eye the disease was in its early and acute stage; there was distinct bulging and thinning of the sclerotic at one point near the cornea, the sight was dim, and the pain was exceedingly severe, and came on in paroxysms. The case had been treated rather actively and antiphlogistically, but without the slightest benefit. My chief object in quoting this case is not so much to confirm Mr. Dalrymple's description as to mention the plan of treatment I adopted as worthy of further trial, on account of the remarkable benefit that immediately ensued. As it appeared to me that the more severe and urgent symptoms were in a great measure due to tension of the globe, and as I could distinctly see a part that was thinning and pointing, I introduced a fine needle and evacuated a small quantity of thin, yellowish fluid; this gave speedy relief, and the case rapidly improved. I repeated the operation once on a slight return of the pain. In a few weeks the globe recovered its shape, and sight was ultimately so far restored that she was able to thread a needle. About a year after she returned to me with threatenings of the old attack. I treated it in a similar manner, and with immediate benefit. The first attack followed very close upon a very severe flooding, and was probably due in a great measure to this cause. I should certainly adopt this treatment in any similar case, as the

result was in every respect satisfactory, and the second attack seemed to confirm still further the efficacy of the plan.

I will now proceed to describe, seriatim.—Firstly, scleritis; secondly, iritis; contrasting and comparing the two affections, both in reference to symptoms and treatment.

Sclero-iritis, or rheumatic iritis, most commonly attacks persons about the middle period of life, in whom some constitutional tendency to rheumatism exists; the symptoms are of a severe and distressing character; the attack is ushered in by a feeling of fullness and tenderness of the eyeball, soon followed by profuse lachrymation, and some intolerance of light; the pain is intermittent, and is chiefly referred to the eyebrow and temple, and even to the cheek and side of the nose; these symptoms, and especially the pain, are usually much aggravated towards night; after a short time vision becomes cloudy and dim. This disease usually attacks one eye at a time, although both are sooner or later involved. On examining the eye it is found highly injected, and on looking more minutely the vessels are found to be situated in the sclerotic coat; they are deep-seated, numerous, but small, and finely pencilled, of a pink colour, and pursuing a straight course towards the cornea, around which they form a capillary plexus; the conjunctiva is usually but slightly involved, a few large loose returning veins being chiefly visible, and being readily distinguishable from the sclerotic vascularity which is a main feature of the disease. On examining the iris, the pupil is found contracted and immovable, the colour changed usually to a greenish tinge; the surface is dull, and the healthy texture of the iris is no longer visible, the little irregularities being coated over by a thin film that uniformly pervades it, and does not present any tubercle, or even any thickening and deposit at the pupillary margin, as we observe in iritis: in severe cases, and especially after repeated relapses or fresh attacks, the capsule becomes cloudy, and as a result of this the sight is impaired. There are two local symptoms that have been insisted upon by some writers as peculiarly characteristic of this disease,—the one is a thin white line around the margin of the cornea, the other is the frothy character of the secretion: the former of these, viz., the white line round the cornea, merely indicates that the conjunctiva and cornea are not involved in the inflammatory action, but that the vessels dip down to the iris, leaving that portion of the sclerotic which is blended with the cornea unaffected, and consequently white; inasmuch as the conjunctiva is sometimes implicated, this symptom cannot be relied upon, its presence certainly indicates this form of inflammation, but its absence by no means contra-indicates it. As regards the other symptom, viz., the frothy secretion, I have often observed it in rheumatic affections, but I am equally sure that it is present in some forms of simple ophthalmia of the chronic and irritable type, so that no sure indication can be obtained from this symptom. Combined with these local signs we usually find some constitutional evidences of a rheumatic diathesis; thus, the patient has probably suffered at some time or other, and may be suffering at that time, from rheumatic pains in other parts of the body; the powers of the system are at a low ebb, the various secretions are in a vitiated state, the tongue is foul, of a whitish-brown colour, and coated over its entire surface, (I have so often noticed this peculiar state of the tongue in this disease, that I consider it a strong indication;) the urine is high-coloured, turbid, and scanty; the skin is usually moist, with a tendency to night perspirations; the pulse is rather weak, quick, and irritable. The more immediate and exciting cause of the attack is generally to be found in a prolonged exposure of the eye to a stream of cold air, to a humid state of the atmosphere, and to the injudicious use of cold applications to the eyelid. This form of inflammation often follows injuries of the eye, and operations performed upon this organ in persons prone to rheumatism, and subjected to premature exposure, or prolonged use of cold lotions. A favourable prognosis may generally be given if the disease is seen in the early stage, and if it is a first attack; that which we have particularly to fear is a relapse during treatment, and a return after treatment, (and it is always prudent to suggest the tendency to such a result,) which is very discouraging, both to the sufferer and to the medical attendant, and, as I have already intimated, is apt permanently to damage the sight.

The treatment of this affection embraces rather a wide range; in fact, it would involve a treatise on rheumatism to enter fully upon this subject. I must content myself, as usual, by indicating a few salient points, leaving the filling up of minutiae and of details to individual experience and observation; and I may add that there are few affections of the eye requiring more care, judgment, and patience. We may conveniently consider the subject under the two divisions of

constitutional and local treatment, as they very materially assist each other, and as either would be nearly useless without the other. In the constitutional treatment the secretions must be acted upon: drastic purgatives are useful, combined with diuretics; and if the rheumatic diathesis is very strong, colchicum is very valuable, if the general powers admit of its administration. If the system is feeble, iodide of potash is a useful substitute, and if the iris is much affected, it may be necessary to exhibit mercury; but though it may clear the surface of the iris, it will not control the inflammation of the fibrous tissue, which is the texture primarily and chiefly implicated. In cases that are very protracted, when the vessels are considerably congested, when the sight is a good deal impaired, and the various medicines I have suggested seem to fail, turpentine has been strongly recommended, and my own experience is very much in its favour, I usually give it in doses varying from a scruple to half a drachm, in a mixture, three times a day, carefully watching its effect in the latter stages of the disease, and sometimes combined with more active treatment. If the system is feeble, if the skin acts freely, and if the pain assumes an intermittent and periodical type, tonics are very useful, and if exhibited judiciously, have a tendency to prevent a relapse. Steel, quinine, and bark may be given; the two latter have obtained most favour with medical men. The late Mr. Tyrrell placed great reliance upon very minute doses of bark and soda, five grains of each thrice a day. It is difficult to arrive at any other conclusion than that the efficacy of so small a dose must have been chiefly due to the alkali, which is known to produce good results in some forms of rheumatism. Where the pain is very intense and protracted, and after the secretions have been freely acted upon, opiates may be given with great advantage, and I think the Dover's powder is the best form.

We may now consider the local treatment. In severe cases, and in the early stage, local bleeding by means of leeches, or, what is still better, by cupping to the temple, is highly useful, and sometimes cuts short the attack. I have known patients describe the relief as distinctly appreciable as the blood was flowing, and have been requested to allow the bleeding to be repeated. I hardly know any other affection of the eye in which such decided advantage follows local bloodletting. The effect may be kept up by the application of a blister either to the temple or forehead; the pain over the brow may be often relieved by rubbing in mercurial ointment, combined with opium, in the strength of one drachm to an ounce, to the seat of pain each night and morning for five or ten minutes; if the surface is blistered it may be dressed with this ointment. Warm applications are usually the most agreeable to the patients, and the most suitable for the disease; but even here exceptions occur in which cold gives relief, and then it is better to allow it. Authorities are at variance as to the propriety of using belladonna with the view of dilating the pupil. It is contended, on the one hand, that if the pupil is allowed to become very small, that it forms adhesions, is permanently contracted, and the capsule of the lens is rendered dull and cloudy; but that if the pupil is kept large, even if the capsule is implicated, some clear space for vision usually remains. Those, on the other hand, who are opposed to the use of belladonna say, that if the iris is implicated the pain and irritation are much increased by the dragging effect of this drug, and that if adhesions have formed it does not enlarge the pupil, and therefore that the motive for its use is not accomplished, whilst positive mischief is occasioned. There is doubtless much truth in the argument on both sides. In the early stage, when the iris is but slightly affected, it is useful to enlarge the pupil, and when the disease is subsiding the same effect may be produced with advantage; but during the active and fully developed stages of the disease, when the iris is thoroughly involved, belladonna often gives great pain, and does not influence the size of the pupil.

I have thus endeavoured briefly to indicate the leading principles which are to guide us in the treatment of rheumatic iritis, and it must be admitted that it seems to include some very different and even antagonistic methods, which are only to be reconciled by explaining each as belonging to some stage of the disease, or as applicable to some variety or constitutional peculiarity; and I can well conceive a student, after reading it, and mastering all its details, feeling somewhat embarrassed when a case of this kind is placed under his care. Therefore, though I feel it is rash, in a disease presenting so many shades of difference, both in its commencement and its various stages, to attempt to dogmatize and to map out a special line of treatment, still, though I should incur the imputation of empiricism, as the chief object of this course is to assist the student, I will suppose a case and my usual plan of proceeding, so as to give some

idea of the order in which I employ the various means I have mentioned. When a case of rheumatic iritis first applies to me, if it is in the early stage and severe, I order cupping to the temple to ten ounces; warm fomentations; mercurial ointment with opium to be rubbed in at night, where the pain is felt, for ten minutes; a drastic purgative of calomel and scammony, two grains of the former to eight grains of the latter, and a mixture containing nitre and sometimes a full dose of colchicum. Then in a few days, if the tongue becomes cleaner, and the secretions normal, I give iodide of potash, five grains, three times a day; or if the system is very feeble, or after the iodide of potash has been given for some little time, I give tonics; quinine, two grains, three times a day, is usually the best. In cases where the pain and sclerotic inflammation have subsided, and the iritis continues, the specific action of mercury is required. Under these circumstances, I always endeavour to act upon the system through the skin by increasing the amount of ointment rubbed into the temple and brow, as I do not find the internal use of mercury well borne by the rheumatic diathesis.

I am not exactly prepared to indicate the particular cases for which turpentine is specially suited. I have usually employed it where other means have seemed to fail, and with very marked benefit; and I have no doubt it is well adapted for some cases in their early stage, and as a primary expedient. A good deal of judgment is required to use the requisite amount of activity to subdue the disease without seriously impairing the powers of the system, as it is highly probable that relapses and returns of the disease are in a great measure due to a feeble state of the system, which must be carefully guarded against during the latter stages by the use of tonics and a liberal diet. The disease I have now described may be complicated with a catarrhal affection of the conjunctiva: this has been termed "catarrho-rheumatic ophthalmia." The former and less important disease may, to a cursory observer, mask the deeper and more serious malady; it is therefore of importance carefully to examine all severe catarrhal affections with a view of ascertaining whether rheumatic iritis coexist. The treatment of the catarrhal complication must be conducted upon the same principles as the simple form of the disease.

#### ON THE

### TREATMENT OF DISEASE BY BLOODLETTING.

By JOHN LANGLEY, Esq.

THE system of treatment which I have advocated through good and ill report would, I believe, if fairly and fully carried out, save thousands of our fellow-creatures who daily fall victims to those morbid conditions which are *always* manifested in organic and other diseases. Indeed, this observation applies to most, if not all, conditions of congestion, and consequent inflammatory action, which are the physical disorders from which, almost exclusively of any other causes, organic diseases\* arise; as also to all those inflammatory conditions of muscles, ligaments, and membranes, with painful affections of the joints and their articulations, commonly denominated rheumatism, hip-joint disease, and neuralgia; all of them terms—*refuge terms*—utterly inadequate to characterize the morbid conditions of the important parts affected; an opprobrium which equally applies to the same abnormal conditions of the cranial, thoracic, and abdominal viscera: as, of the brain, hydrocephalus; of the lungs, consumption; and of the peritoneum, ascites; all, to my mind, distinctions without a difference, being only the final symptoms, or rather fatal terminations, of the inflammatory conditions of the organs affected, resulting from inadequate depletory means and consequent congested condition and inordinate action. The same may be said also of the incipient stages of all tumours, and all painful conditions arising from the pressure of the over-dilated bloodvessels upon their contiguous nerves,—the only way in which, I believe, the sensation called pain can be rationally accounted for; also of the formidable and most distressing phases of uterine disorders and diseases, and also of that really peritoneal inflammation masked in the vague term of "puerperal fever." It is also a most important adjuvant in obstetric practice,—in the safe and speedy promotion of uterine relaxation, in rigidity of

the os uteri, and all other parts concerned in parturition, and the sheet-anchor in puerperal convulsions; and, what is perhaps of more importance, the fortifying those delicate parts which cannot fail to suffer from long pressure and contusion in protracted and difficult parturition, from naturally anticipated inflammatory action,—the only state to be guarded against, the hydra of all diseases.

I would also wish to include in the range of depletory treatment by venesection, mania, incipient blindness, and deafness, with almost all eruptive diseases.

The full, long, and positive experience I have had of the value of timely, copious abstraction of blood in all disorders or diseases of an inflammatory or congestive character, (and I confess I am aware scarcely of any others,) emboldens me to approach you in this unequivocal manner, especially knowing and feeling as I do that the whole profession, almost to a man, are opposed to me, although (*absit invidia*) not qualified† to decide the point, never having tested it—that is, never having carried it out to half the extent I have; but perhaps fearing the attempted remedy might be charged upon them as the cause of the fatal result, they leave the disease in uncontrolled mastery of the field, in accordance with the erroneous and dangerous opinion of Dr. Dickson, who, in his work on the "Fallacies of the Profession," written evidently *ad captandum vulgus*, attributes all the ills which "flesh is heir to" to the lancet. I have taken the liberty of sending the following cases, the last I shall trouble you with, and shall feel greatly obliged and honoured by your inserting them in your journal. You will find them strongly pertinent to the advocacy of my practice, and showing the kind of objections of the highest members of the profession to its adoption; and I most fearlessly challenge them, one and all, to satisfactorily repudiate either my theory or practice, and show wherein I am wrong, or even how any or what possible evil can result from my practice. An assertion without proof is "*vox et preterea nihil*." I would say to them, in the language of my favourite author, "*Si quid novisti rectius istis, candidus imperti, si non, his utere mecum*."

CASE 1.—On Tuesday, March 25th, 1852, I was consulted by Mr. J. L—, of Duke's-road, St. Pancras, who, with his wife, communicated to me the following statement:—On the 27th of December, 1850, having indulged in the repletory viands and stimulating beverages usual upon this festive season, he was seized about 10 o'clock P.M. with a fit, falling down senseless, with stertorous breathing, intense redness of face and forehead; heated head, and staring, visionless eye. In this dilemma his wife called in the nearest medical gentleman, who considered the case to be apoplectic. The parties present urged the necessity of taking away blood, which he repudiated, stating as his reason, that he considered it a case of "temporary determination of blood to the head, the effect of excitement and high living, and preferred attempting to relieve him by medicine, low diet," &c. This state continued with little alteration for some hours, when two leeches were applied *temporibus*.

On the following day consciousness returned, but a heavy, painful sensation was felt in the head, chiefly on the right side; his sight was misty; his head dizzy; and, contrary to his usual disposition, an irritability most distressing to himself and all around him; objects and circumstances which previously afforded him comfort and pleasure now caused him aversion and disgust. This condition continued with varied intensity for three months under medical treatment. The gentleman in attendance considered the case as one of a *nervous* hypochondriacal character, advised generous diet, and that he should be exposed to exhilarating and exciting positions, as visiting his friends, occasionally attending the theatre, &c.

Upon presenting himself to me, he complained of most distressing pain over the anterior portion of the right hemisphere of the brain, a feeling of distress and irritability which no moral effort on his part could assuage or control; the effort to do so increased the malady; the prattle of his children distracted him, and he was quite unable to attend to his business, as an upholsterer, and lived every hour in dread of a similar attack to the one he suffered as above described. His pulse was 120, hard, jerking, and wiry; his tongue dry and deep red; the

\* *Vide* Case of Puerperal Convulsions of extreme severity subdued by unprecedented depletion.—THE LANCET, January, 1849.

† In proof whereof, Mr. Webber's assertion at the late medical meeting in Hanover-square, that the instrument called the *lancet* had nearly become extinct with the profession, and, in a vituperative strain, expressed a hope that the journal, *quodam nomine*, would share the same fate; whereas I hope it may exist as much longer, as I know it has already, (having purchased the first number published nearly thirty years since,) and prove a powerful engine in enlightening the profession upon an error most fallaciously grounded upon hypothetical theory and untested experience.

\* The important distinctive line to draw in, between disorder and disease, between functional and organic evils; and, again, between disorders affecting the functions of vital organs immediately tending to their disorganization, and disorders affecting parts and tissues, which may be even obliterated in function and substance, if any such there be, without any material impediment to life. To such states I would say, careful attention must be paid that they do not grow into the more serious condition of organic lesion from neglect of active treatment.

temperature of the head far exceeding a natural heat, accompanied with a general distressing fidgetty uneasiness, a morbid vigilance pervaded his nights, constantly getting in and out of bed. Taking all the symptoms concurrently, accompanied with so much mental irritation, I could entertain no other diagnosis than chronic congestion of the vessels of the brain, or chronic meningitis. I proposed immediate venesection, which he repudiated, from the impression made upon him by the aversion of his previous medical attendant to such a course. I reluctantly yielded to his prejudice, gave him five grains of calomel, and ten of jalap, with a mixture of infusion of senna and sulphate of magnesia.

He came to me on the following morning; his bowels had been freely evacuated, and his night passed rather more tranquilly, but the pain of the head, irritability, and confusion of intellect still existed, with a pulse of the same character as the previous day. I now insisted upon bleeding him, telling him if he would not submit I would abandon his case, and leave him either to the affliction of insanity\* or premature death. This declaration fortunately prevailed, and I abstracted fifty ounces of blood from his arm. *No syncope followed*; some slight relief from pain. He expressed himself shortly afterwards as feeling more composed and comfortable; his pulse became more open and compressible, a condition I invariably recognise under such circumstances. I gave him acetate of morphia, one grain, to be taken at 8 o'clock in the evening; an evaporating lotion for the head, and foot-bath; mustard plaster between the shoulders.

27th December.—Eleven A.M.: Walked one mile to call upon me. His wife, who accompanied him, said he had passed a night of uninterrupted rest, pain much abated, with more natural, tranquil condition of mind, but with a pulse undiminished in frequency, and nearly of the same wiry character as at first. I took thirty ounces more blood from his arm; ordered him a cathartic; to repeat the previous treatment. Being obliged to leave town, I did not see him again until the 29th, at three P.M., when I found him much improved in every respect; had passed a very tranquil night without the morphia. I told him to keep perfectly quiet the rest of the day, take no medicine, and call upon me the following morning, which he did at eleven A.M. I was sorry to find him not so well; he had experienced return of pain in his head, although much mitigated, and his night passed very restlessly and miserably. His skin was heated; he seemed more irritable; his bowels had not been moved for thirty-six hours. I repeated the calomel and jalap and the night draught, and said if not much better tomorrow I should take more blood from him. "Why not now?" he said; "you know, sir, it has always relieved me." *Anxious to have that done he so much dreaded before.* He visited me on the following day, in nearly the same state as the preceding day, and was most anxious that I should bleed him again. Unswayed by his wish, I bled him to twenty-five ounces; *no syncope*; repeated the night draught, and told him I would call upon him the next day, which I did at one o'clock. I found him much relieved in every respect, reading quite composedly. I examined him very closely, and had every reason to be fully satisfied with the safe progress made. I told him we would rest upon our oars; prescribed the sort of diet I approved; ordered him to take an aperient every or every alternate morning, and in the absence of any material change not to come to me for a week. On the fourth day his wife called upon me, wishing me to see him, as she thought he was not quite so well, and stating that he persisted in saying he should not be so unless he lost more blood, an instinctive feeling which directed him rightly. I felt a conviction that further depletion was necessary, and had desired the week's previous abeyance from medical treatment that I might watch the ulterior effect of reaction, that *mischievous action*, which follows the inefficient depletions generally resorted to, but which was almost entirely absent after the large evacuations I effected in this case; corroborating my previous experience, that unless bleeding is carried to an extent to preclude violent reaction—that is, in such degree as to control and modify the muscular power of the heart and arterial system—little benefit is to be anticipated from it. As stated before I made this digression, I thought I should be justified in taking more blood; but that I might have my opinion fortified, I took the great liberty of sending

my patient to Dr. Robert Lee, in whose physiological and pathological acumen I had the greatest confidence, with the following note:—

[COPY.]

"MY DEAR SIR,—Will you kindly examine this patient for me, and prescribe for him agreeably to the symptoms which present themselves to your notice, without reference to any previous treatment.

"I am, my dear Sir, yours very respectfully,

"34, Albany-street, Tuesday morning."

"JOHN LANGLEY.

In obedience to my desire, the patient never said he had lost any blood, nor did Dr. Lee ask him, but ordered him to apply twenty leeches to his head, and prescribed a dose of calomel and jalap, to be followed by a black draught; *I think most clearly evincing that he considered depletion necessary, and could not detect any contra-indication to it, notwithstanding the great extent it had been previously carried to.* I desired him implicitly to adopt Dr. Lee's prescription, telling him that probably, after his full depletion, this local bleeding\* might have the critically curative effect. He applied the leeches, took the medicine, and came to me by my direction in three days, when he told me he had found little or no relief from the leeches. I still thought it right to bleed him, but determined before doing so to send him to Mr. Guthrie, with a note couched in the same terms as the one sent to Dr. Robert Lee. With that great kindness I have often experienced when in professional doubt, and which I take this opportunity of most gratefully acknowledging, Mr. Guthrie examined my patient very carefully, and sent me the following note:—

[COPY.]

"DEAR LANGLEY,—Take some blood from this man's arm, and send him to me again on Wednesday.

"Ever yours,

"G. J. G."

The same injunction was given and observed, as to the loss of blood, with Mr. Guthrie as Dr. R. Lee. I was happy to have the concurrence of both these eminent gentlemen in the propriety of further depletion, only differing in the mode. I took away thirty-seven ounces more, making a total, in less than sixteen days, of 150 ounces of blood, besides that from twenty leeches. While the last few ounces of blood were flowing, a profuse perspiration supervened, with tendency to fainting, when he expressed himself as feeling an extraordinary sensation in his head, with a clearer perception of passing events, saying, "I know myself now; I am J. L.—;" pronouncing his name with more distinct articulation than before. Not having completely fainted, I allowed him to recline upon my sofa; in a quarter of an hour he arose, said he felt quite comfortable, put on his coat without assistance, and walked home, a distance of a mile. With attention to his bowels, gradually improving diet, and exercise, in a week after I presented him to Mr. Guthrie, whom I had to meet with Sir Benj. Brodie upon a severe hip-joint disease. He told Mr. Guthrie he was quite well, and ready and anxious to go to his employment, which he did the following day, and has since continued to do. I feel it my duty to apologise to Dr. Lee and Mr. Guthrie for withholding the treatment adopted previously to my patient's consulting them, but when they read the following case, and the anathema against bleeding pronounced by such high authority, to my prejudice with my patient, I rely upon their candour to treat venially such, I hope, laudable deception, solely instigated by, to me, the highest incentive—the restoration to health of my patient.

(To be concluded.)

## OBSERVATIONS ON CHOLERA.

By M. J. RAE, M.D.,

PHYSICIAN TO THE CARLISLE DISPENSARY.

(Concluded from page 189.)

As precautionary measures to be adopted with respect to cholera, I would strongly insist upon all public establishments, as gaols, asylums, poor-houses, &c., being cut off, as far as practicable, from all communication with infected districts. Public hospitals ought not to be opened for the reception of

\* I cannot bring my mind to the conclusion that there are any diseases, or rather disorders, of this class unconnected with organic disturbance or positive lesion of the brain. The subject demands the most serious investigation. I know and feel that I have often dealt with mental aberrations, delusive feelings, and violent tempers, the "brevis furor iræ," with most happy success, viewing them as the result of chronic congestion, or modified, or sub-acute (as it is called) inflammation of the brain, and I most sincerely believe nine-tenths of our incarcerated fellow creatures are of this class, and the other tenth made up of anomalous cerebral conditions involving eccentricities.

\* This description of depletion is often resorted to in lieu of general bleeding; I feel assured it is quite useless as to its local influence in inflammations or congestions of any internal organs, especially the lungs or brain, as the only advantage gained is in reference to the quantity taken from the mass, and leeches to the feet would be triflingly more useful than to the scalp or pectoral muscles,—inflammation of the palpebræ or phlegmonous external tumours excepted.

cholera patients, unless under the most urgent necessity, because such a proceeding might lead to the outbreak of the epidemic in the other parts of these establishments, and therefore to the destruction of many individuals who might not otherwise have fallen victims to the disease. But the same objections may not hold good with respect to their admission into fever hospitals. If these are detached buildings, and their inmates can be accommodated in wards which admit of being isolated from the others, I would recommend their appropriation to that purpose. The risk of fever patients taking cholera may also be less than surgical and other patients. Sheds should be built, and houses taken and fitted up for cholera hospitals.

In addition to the thorough cleansing of towns, the removal of all cesspools, foul drains, and filthy accumulations of decaying animal and vegetable matters, and of all known sources of atmospheric pollution, I would recommend great attention to personal and domestic cleanliness, and the use of carefully-filtered water for dietetic purposes. If this cannot be had, that which has been boiled, and allowed to cool in closed vessels, as mentioned by Dr. Playfair, should be used. But I would more especially recommend, and strongly urge, the free use of disinfectants in houses in which the disease has shown itself—lime, sulphuric acid, chloride of lime or zinc. One or other of these should be freely employed in the rooms and wards occupied by cholera patients. The dejections and clothes cast off from the bodies or beds of the sick should be quickly saturated with chloride of lime, and be removed from the apartments without delay.

If the effluvia arising from the bodies of cholera patients and from their dejections be allowed to accumulate and remain in the atmosphere of their rooms, they act as powerfully depressing causes upon the sick, and therefore materially diminish the chances of their recovery from the malady. The free use of disinfectants in the chambers and dwellings of cholera patients, besides destroying all noxious effluvia, thus placing the sick under conditions more favourable to recovery, may also either directly destroy the choleraic poison eliminated by their bodies, or else indirectly by having removed the pabulum or conditions necessary to its spread and continuance, and therefore be the means of checking the progress of the epidemic, and of giving the attendants and others exposed to the influence of the contagion a greater immunity from attacks of the disease. I would also recommend the frequent employment of such agents in all houses during the course of the epidemic in their locality, whether the disease has made its appearance in them or not.

Great attention should be paid by all parties to the state of their bowels during the course of the epidemic. The ordinary diet, or that which experience has proved to be the most suitable to an individual, should be used by him during the prevalence of the malady. Chicory should, in my opinion, be wholly excluded as an article of diet; its irritant effects on the bowels frequently induce purging and griping in many individuals; and I have no doubt that its use as food will act as a very common predisposing, if not exciting, cause of an attack of cholera.

The moderate use of spirits should be particularly insisted on by all practitioners. Their daily and liberal use is often recommended by medical men as a sort of prophylactic in cholera, but I believe it to be a most pernicious practice, one more likely to induce than to ward off an attack of the disease. While I would permit drunkards and those accustomed to take spirits to have a fair, daily allowance of them, I would insist upon all perfectly sober and temperate individuals to abstain from the use of all intoxicating drinks during the prevalence of the disease amongst them, unless when they are exhausted by unusual bodily or mental labour, and then a little spirit may be taken by them with advantage. But persons of strictly sober and temperate habits, and who are in their usual state of health, cannot be too cautious in taking spirits, because the use of them tends to, and often does, produce biliary and intestinal derangement in such individuals, and therefore predisposes them to an attack of cholera; and the daily use of spirits during the prevalence of cholera, by these parties, may produce in them a state of the constitution that is peculiarly obnoxious to cholera. For the most severe and fatal attacks of the disorder often seize individuals of usually steady habits after a slight over-indulgence in drink. I come now to speak of the treatment of cholera.

Having had considerable opportunities of observing and treating the malady during the epidemic in 1848, and having tried, and seen tried, almost every variety of mode of treatment, with various degrees of success, as calomel, calomel and opium, acetate of lead, sulphate of zinc, and other mineral

salts, with opium, astringent mixtures, with brandy, &c., the mode of treatment which I found to be the most successful—and which I would adopt were I again called upon to treat the disease—is that by injections. Though calomel and opium, astringent pills, and mixtures, may be quite sufficient for the successful treatment of a mild case of cholera, or of the premonitory stage of the disorder, they are not to be depended upon in cases where the disease is developed in all its fearful intensity. There is always great uncertainty attending the treatment of a serious disease by the exhibition of remedies by the mouth alone, where great irritability and violent action of stomach exists; and as this condition of the stomach is so important a feature in an attack of cholera, the hope of treating a severe form of the disorder by remedies introduced into the system through this organ alone will generally end in disappointment. The remedies so administered may be rejected in whole or part, or may not be retained in sufficient quantity to make a decided impression on the disease; or not before either a fatal collapse has been established or the system has been reduced so much by the violence of the disorder as to render ultimate recovery hopeless. And bulky remedies, such as astringent mixtures of catechu and kino, with chalk, &c., are worse than useless, as they keep up the irritability of the stomach.

In a disease so dreadful and rushing so rapidly to a fatal termination as cholera, remedies to be of any use in the treatment of it must act speedily and with vigour upon the system. Injections of astringent medicines have this property; and if they are properly employed in the treatment of cholera, I believe that more invariable success will attend their use than that of any other mode of treating the disease. My method of treatment in a well-marked case of cholera was to give two or three grains of solid opium at once—no calomel; then an injection, of about eight ounces of a solution of starch, containing four to eight drachms of tincture of catechu, and twelve to fifteen grains of acetate of lead, to be thrown well up into the bowel; repeating the injection with the same or less quantity of astringents, according to circumstances, every two hours, or after every free motion; continuing the opium in one grain doses every hour; keeping up the circulation on the surface and at the extremities of the body, and endeavouring to relieve the violent spasmodic action by the application of warmth to the feet and limbs, and by the constant employment of turpentine stupes or stimulating liniments over the abdomen and spine; allowing fluids to be taken in small quantities only at a time, because their free use keeps up the irritability of the stomach, and encourages the looseness of the bowels, and if they are freely used cold they tend to chill the body, and induce collapse. The intense thirst that generally accompanies a severe attack of cholera is, no doubt, chiefly owing to the profuse watery discharges that have taken place from the bowels, but it is often caused partly, and always aggravated, by the large quantities of brandy that is often allowed patients by their medical and other attendants. I therefore give brandy very sparingly during the early stage of the disorder, trusting chiefly to the opium, or to tincture of opium with ammonia and sulphuric ether and ice, to support the strength and relieve the spasms and vomiting. One or two injections generally suffice to check the violence of the disorder, and to place the patient beyond danger from the attack. The injection being diffused over an extensive tract of mucous membrane is soon absorbed, and the constitutional sedative and astringent action of the remedies is therefore speedily produced, arresting the profuse discharges from the bowels, subduing the cramps, relieving the irritability of the stomach, and promoting the heat and saving the strength of the system.

But the topicals assist the constitutional action of the medicines in the production of these beneficial results. They corrugate the mucous membranes, relieving the congestion of the papillae and mucous glands and follicles. They constrict the bloodvessels, and check the vermicular action of the bowels; and the sedative effect of the lead upon the nervous filaments of the intestines must not be overlooked. The local effect of the astringents may also tend to divert the current of the circulation from the bowels to the surface of the body, and thus assist the action of the opium in keeping up the heat of the external parts.

The opium, in the form of a pill, is a useful auxiliary to the injections, and its small bulk does not offend the stomach. It soothes the irritability of the nervous system, restrains the action of the bowels, supports the strength, and keeps up the circulation at the surface of the body. Having subdued the looseness and tranquillized the nervous system by the above means, from six to ten grains of calomel alone were given, and

repeated every two or three hours until the bile appeared in the stools, when a favourable result in most cases might be confidently anticipated. Many practitioners attach little or no importance to the circumstance of the bile appearing in the stools; but its presence there shows that the liver, whose function had been suspended during the early period of the attack, has now resumed its action; and this is an evidence that the system is recovering from the shock given to it by the disease. I consider it of the first importance—nay, as an essential element of ultimate success—to get the liver and kidneys to act, and the intestines to return to their normal action, as soon after the cessation of the purging as possible. This guards against a relapse, checks or prevents secondary fever, and gives greater security against the supervention of collapse.

How much of the delirium, fatal coma, and depression, which often occur in cases after they have appeared to have been progressing favourably, have been owing to the presence of urea, bile, and other impurities in the blood? The suppression of the functions both of the kidneys and liver for so long a period as often occurs in cases of cholera, allows their excretory matters to accumulate in the blood, which act injuriously upon the brain and nervous system, depressing still further the vital powers, and co-operating with the direct effects of the choleraic poison upon the system, in the production of the unfavourable and fatal results of the attacks of the malady. And when we consider that the system is almost drained of blood in a severe attack of cholera, we may see the necessity of restoring that which remains to its normal condition as speedily as possible; to effect which the action of the liver and kidneys is essential, and as these organs cannot be roused to action during the violent and profuse action of the bowels, (hence the folly of giving calomel in frequent doses, with this object in view, in the early stage of the disease,) there should be no time lost, after the purging has ceased, in endeavouring to get them to resume their functions as speedily as possible. In urgent cases, or where violent reactionary fever was anticipated, twelve or fifteen grains of calomel were given at once, followed in two or three hours by five grains, and repeated if necessary. The calomel acts as a sedative, subduing the morbid irritability of the intestines, and the excited action of the stomach. It also stimulates the liver, promotes the healthy action of the bowels, and excites the kidneys to the performance of their functions. These results having been obtained, calomel was laid aside. Light bitter infusions, and occasionally a mild aperient, were given. In cases where a tendency to collapse existed, the opium was given more frequently, one-grain doses, combined with four grains of camphor, allowing a little more warm brandy and water or wine negus, warm beef tea, and applying the heat and frictions, or stupes, more assiduously to the extremities and abdomen. When the cold stage was fairly established, brandy and water, and a stimulating mixture, composed of sulphuric ether, tincture of capsicum, aromatic spirit of ammonia, and camphor mixture were given alternately, every half-hour or twenty minutes. Bags of hot salt, &c., were applied along both sides of the body, from the feet to the armpits; strong ammonia liniment, or mustard sinapisms, applied over the whole of the abdomen and chest; warm beef-tea or soup were given freely, but only small quantities of cold saline drinks were allowed; ice was given, instead of large quantities of cold drinks, when thirst was urgent. These means, assiduously applied, and varied according to circumstances, frequently succeeded in establishing reaction in very serious cases of collapse. Great care and attention are required in the management of the reaction succeeding the collapse, lest it be carried too far. The stimulants should be gradually reduced in quantity and frequency of use, and the warm applications cautiously withdrawn from the body. I have often seen fatal coma occur in cases where reaction had been well established, and a favourable result looked for, by allowing the warm applications to remain too long in contact with the body, the consequent profuse exhalations exhausting the patients. The same result may supervene upon the too free exhibition of stimulants. And as sulphuric ether and ammonia act quickly, and are not so permanent in their effects as brandy, I prefer giving them in the collapse stage, and at the commencement of the reaction, alternately with the brandy, because they are not so apt to be abused by the attendants; and the danger of subsequent coma is less to be apprehended when they are used along with brandy, than when brandy alone is employed in the stage of collapse. Reaction having been established, three or four grains of calomel were given, and small doses of calomel, calomel and opium, or with James's powder, were given every half-hour, or at longer intervals. Soda water, lemonade, whey, &c., were

allowed for drink, and beef-tea and wine were freely exhibited. A most troublesome irritability of the stomach often remains after the purging and cramps have ceased, and it is often a marked feature in the reactionary stage of the disorder. It is generally best treated by allowing small quantities only of fluids to be taken at a time, as soda water, and those containing mineral and vegetable acids, and by the free use of ice. The dilute sulphuric acid, in half-drachm or one drachm doses, often subdues it when nothing else will; and as the use of the acid does not interfere with the exhibition of calomel, it may be safely and beneficially administered. The value of this acid in checking the excessive action of the stomach in cholera was pointed out thirty years ago by a West Indian practitioner, as mentioned by Dr. Thomas. The acid, besides subduing the irritability of the stomach, acts beneficially on the intestines. Sometimes creasote, hydrocyanic acid, and the application of strong ammonia liniment, or cantharides plaster, to the region of the stomach, have most influence in subduing the morbid action of the stomach. In conclusion, I would strongly recommend the treatment of cholera by injections. This mode being more rapid and more certain in its effects and more successful in its results than any other that I have either seen or adopted.

Carlisle, July, 1854.

### ON A CASE OF DISLOCATION OF THE ELBOW-JOINT, WITH PARTIAL FRACTURE OF THE INTERNAL CONDYLE.

By WM. WALKER, F.R.C.S., &c.

MASTER D'A—, aged fifteen, while playing at leap-frog, missed his object, and fell over on one side, his forearm coming with great force to the ground. He was immediately raised up by his schoolfellows, when it was discovered that he could not straighten the arm. Mr. Newberry, surgeon, of Liverpool-road, was soon in attendance, and readily detected the nature of the accident, but was unable to reduce the dislocation. Cold lotions and rest were strictly enjoined, to arrest the swelling around the joint, when another attempt at reduction was made, which was also unsuccessful. As the friends of the youth expressed a wish that I should visit him, the accident having occurred a fortnight back, I communicated with Mr. Newberry, and met him twice or thrice in consultation; but as the joint continued in a state to cause some anxiety, we suggested the propriety of having further advice, when Mr. Coulson was called in, who, on examination, thought it probable the inner condyle was firmly fixed over the coronoid process of the ulna, and decided at once the necessity for the application of a splint, with screw extension, which was at once obtained from Mr. Fergusson's, Giltspur-street, Smithfield. The patient began by wearing it two hours daily, gradually increased to three. After thus persevering in this plan for three weeks, he was enabled to lay aside the instrument, and regained perfect use of the limb, and with the exception of some degree of thickening about the condyle, he has as useful a joint as before the accident. Mr. Coulson, will, I am sure, feel much pleasure at the successful issue of the case, and the treatment as suggested by him, and carried out according to his instructions.

St. John-street-road, Clerkenwell, Sept., 1854.

THE MALABAR COOLIES.—Blood drawn from their veins will be found greatly deficient in fibrin, albumen, and colouring matter. Their nervous system does not betray that amount of sensibility to external impressions which is observed amongst other classes, and it is a remarkable fact, that a Tamalian will bear any amount of what is known as "shock to the system," without any detriment; while the slightest drain from the body—as a few fluid evacuations from the bowels, or rather copious discharge from an abscess—is sure to be attended with the most serious consequences. The whole limb may be severed in surgical operations, and scarcely a groan will escape him. A patient cannot manifest less sensibility to pain under the knife of the surgeon than a poor Malabar, when previously desired to "screw himself up to the sticking-point;".....but the Tamal coolies, from a natural state of physical infirmity, are perfectly incapable of supporting anything like an exhausting influence.—Mr. DICKMAN in *Ceylon Miscellany*.

## OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum  
et dissectionum historias, tam aliorum proprias, collectas habere et inter  
se comparare.—MORAGNI. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

### KING'S COLLEGE AND CHARING-CROSS HOSPITALS. CASES OF HYDROPHOBIA.

(Under the care of Dr. TODD and Dr. ROWLAND.)

In a late number of this journal, we had occasion to call attention to a case of hydrophobia which had been treated at Guy's Hospital, (THE LANCET, vol. i. 1854, p. 535,) in which the patient perished with the well-known symptoms of this terrible disease; since that period several other cases have occurred in the metropolis, two of which were admitted into public institutions; and we beg this day to put upon record the details of these two instances of hydrophobia, which were respectively observed at King's College and at Charing-cross Hospitals.

Before doing so, however, we would just say that these cases present a difference of some moment with the one treated at Guy's, as the attacks in the former followed pretty soon after the bite of the rabid animal, whilst it is alleged that Dr. Hughes's patient had been bitten several years before he was seized with the symptoms of hydrophobia, to which fearful disease he speedily fell a victim. Now, it is not an unimportant matter for medical men to inquire whether an incubation of several years is possible; the disease, or tendency to the disease, lying dormant for a long time, and bursting forth under the influence of an exciting cause. Trustworthy records of cases are in existence, in which it is distinctly stated that seventeen and nineteen months elapsed between the inoculation of the poison and the development of the disease. Dr. Bardsley has recorded a case in which there was an interval of *twelve years* between the bite and the first hydrophobic symptoms; nay, even twenty and thirty years have been mentioned! We must confess that we have no more difficulty in believing in an incubation of ten years than in one of ten months, for it is plain that if the organism can remain tainted for ten months, without any outward manifestation being noticed, and the disease burst forth after that period, the attack can only be owing to a *peculiar* exciting cause, that cause coming from within or without. If from without, it may present itself in the shape of some extraordinary fright or shock; if from within, it may consist of some morbid change in the fluids of the economy, acting upon *predisposed* nervous centres.

Although it is somewhat repugnant to give faith to an incubation reaching over many years, and although the prospect of such a cruel and protracted suspense is awful to contemplate, it is nevertheless true that it requires hardly more stretch of mind to believe in such prolonged incubation, as to give credence to the possibility of *hereditary tendencies*. It has, in fact, never been explained in what hereditary morbid tendencies consist; but we can hardly conceive any other mode of operation than a mysterious modification of the fluids, influencing the nervous centres at certain periods and under certain circumstances. Now, when a person is inoculated with the variolous or vaccine virus, it is probable that the fluids (or, more properly speaking, the blood) are modified in a manner unknown to us, but in such a way that they become insusceptible to the influence of small-pox emanations. Now, to understand hereditary predisposition, or prolonged incubation, it is only necessary to reverse the matter, and say (still hypothetically)

that the fluids become *more* susceptible, under the influence of external or internal agents, of conveying a peculiar stimulus to the nervous centres.

This doctrine is, respecting hydrophobia, of a distressing and appalling nature, for there is but one step from believing in indefinite incubation, to crediting hereditary transmission of hydrophobic tendencies, by people who, after having been bitten, have never evinced any hydrophobic symptoms. This looks almost monstrous, and yet it is not widely different from latent secondary syphilis, in which some pathologists believe. In this latter case there may have been a chancre, (following an inoculation somewhat similar to that effected by the bite of a dog,) the sore may have become indurated, the organism tainted, the manifestations kept off by remedies, or never brought to light for want of exciting causes, and the disease transmitted to the offspring, without either parent having presented any secondary symptoms.

We must not plunge too deeply into these pathological arcana; it is, however, evident that the obscurity might, by patient and persevering investigation, be partially dispelled. The only fact to which we especially wished to allude, is the likelihood, judging by analogy, of very prolonged incubation of hydrophobia, the matter remaining of course wrapped up in doubt and uncertainty.

Whatever view may be taken as to this prolonged incubation, it is plain that the great majority of cases present symptoms soon after the inoculation of the poison, the average being between thirty and forty days. This is the lapse of time generally observed, and it seems as if these four or five weeks were required in order, in some degree, to saturate the economy, the slightest exciting cause being then sufficient to disturb the nervous centres. But, as has been justly said, all hopes rest on the *prevention* of the disease, for when once developed it is beyond the reach of our art. We should not be satisfied with half measures when a case is brought to us, and when the slightest suspicion exists, we should resolutely excise the bitten part, wherever situate; and use the cupping-glasses upon the wound thus made. Cauterizing, except it be very deep indeed, will avail nothing; no good can be expected save the part be completely destroyed, and a clean raw surface obtained.

The analogy of syphilitic inoculations might here be called to aid; for it is well-known that the virus having once been placed under the epidermis, no cleansing, washing, or cauterizing will avail in preventing the evolution of the sore; nothing but the destruction of the part being capable of arresting absorption. Practitioners cannot therefore be too careful, and should make up their mind to excise or cauterize deeply, and apply the cupping-glasses, as advised by Sir David Barry, whenever people are brought to them who have been bitten by a suspected animal.

Some authors think the parts should be excised, even when cicatrized, and although some time may have elapsed since the bite was inflicted. The propriety or efficacy of this measure may be questioned; for if there is any truth in the current theories respecting absorption, the excision of the cicatrix, when plenty of time has been allowed for the virus being taken up into the economy, is perfectly useless. The operation may, however, be performed, simply upon the plea that, with the prospect of so dreadful a disease as hydrophobia, *nothing* should be left undone which holds out the slightest chance of preservation.

We need hardly say that attention should especially be paid to such cases in the hot season, for it is ever during the prevalence of a high temperature that rabid dogs are met with. But the malady is, according to the registrar's report, (week ending June 22nd, 1854,) more frequent this summer than usual; four deaths having recently occurred from it. The heat alone does not, however, seem capable of engendering the disease; for it is well known that in some very hot countries, as for instance Egypt, hydrophobia is quite unknown; we are thus driven to suppose that it is the contrast of a high, with an habitual intermediate or low temperature, which may give rise to the disease in the canine race. Very prudent and praiseworthy precautions are at the present time taken by local authorities to check the spread of the disease; (the dread of which has been somewhat superseded by the alarm felt on account of the ravages of cholera,) and the muzzling of dogs is certainly a very wise measure. But wise measures should also be carried out with zeal, and we hope that all those concerned will obey orders with due alacrity. We say this, because we ourselves saw a wretched-looking dog, of small size, dragging its way along, with mucus hanging from its mouth, and very little promptitude evinced in destroying the poor animal.

The precautions to which we are alluding are the more imperiously demanded as the disease, as is well known, spreads rapidly amongst dogs, man being much less susceptible. In fact, individuals have been known to be bitten by the same animal which had communicated the disease to other dogs, and to escape unhurt. The inoculation must be complete for the effects to ensue, and the virus is arrested in its course by obstacles, such as clothes, &c.; so that persons who have to approach suspected dogs, should be careful to cover and protect any part exposed to injury. Nor should unnecessary alarm be created by the virus coming in contact with mucous membrane, as it is thoroughly ascertained that actual abrasion is indispensable for absorption.

In the two cases which we have to bring before our readers, the inoculation took place in an undoubted manner, by means of a bite from an animal in a rabid state, and the incubation lasted about the usual time. In one of the cases, however, there is a strong doubt as to the state of the dog. We shall have to allude to this circumstance (one of vast importance) in the sequel; but would just observe that we use the word *rabid* for want of a better one; as the dogs affected with the disease in question do not evince symptoms of furious madness. As to the term hydrophobia, it is not at all applicable to the canine species, as mad dogs (and also wolves) will drink freely, and are very greedy of water. The following details were obtained from the notes of Mr. Edwards, house-surgeon to the hospital:—

### KING'S COLLEGE HOSPITAL.

HYDROPHOBIA; DEATH; AUTOPSY.

(Under the care of Dr. Todd.)

GEORGE G—, aged thirty-six years, married, and by trade a colourman, was admitted June 25th, 1854, under the care of Dr. Todd. The patient said that about three months before his admission a Newfoundland pup, (his own property,) quite unprovoked, snapped at his wife's hand; he took hold of the dog, intending to beat him, when the animal bit his left hand. The dog seemed out of health for the two following days, snappish, and irritable, so that he thought it unsafe to bring the animal into the house again. The pup was now kept at the patient's workshop, but the continued barking and ferocity of the dog induced the man to drown him, and the whole of the circumstances were soon forgotten.

Nearly eleven weeks now passed away, when the patient's wife was attacked with small-pox, and he sat up with her at night and watched her. He now felt extremely depressed and weak, but thought that the want of rest sufficiently accounted for his feeling so debilitated. Two days before coming to the hospital he was, however, so exhausted that he went home with the intention of taking some beer and going to bed early. On trying to drink the beer, the patient experienced a choking sensation, but was able to get some of the fluid down, when he retired to rest and slept till the morning. On getting up he attempted to drink some coffee, but again felt as if he were going to choke; he then consulted a surgeon, who gave him some physic, a mustard poultice to his throat, &c.

*State on admission.*—The man seems in good health, muscular, and erect, and answers questions rationally; his face is pale and pupils dilated; he keeps his mouth open with the lower lip dropped, and the upper occasionally twitching. His forehead is covered with a cold, clammy sweat; he has a very anxious expression; and is perpetually swallowing. The patient says that he is suffering from headache; that he feels as if the gullet were clogged up with something like paste, which he cannot swallow; and that he dreads spitting as it brings on nearly as severe a fit as drinking. The slightest draught of air threw him into a spasm exactly resembling the state of a man under a shower-bath when the water first strikes down.

He asked for some water, and then turned to a patient, and talked very quickly, as if to lead away his mind from the consciousness that water was coming,—glancing occasionally and nervously round to watch the nurse's movements. When the water was put before him, his face became congested and his whole body shook; his features began to work like those of a man in an epileptic fit, beads of perspiration trickled down his face, he made a sort of sobbing noise in his throat, threw up his trembling hands as if to motion away the glass, when, with a powerful effort, he snatched it with both hands, lifted it to his mouth, and threw some of the water down his throat. Then the violence of the spasm was redoubled for a few seconds, and he sank back exhausted, like a man who had

been undergoing a severe bodily exertion. His mind is perfectly clear, and he seems a very sensible kind of man.

Mr. Edwards, the house-surgeon, gave him some ice, which he swallowed by an immense effort; he then took some water, and the spasm was of the same kind as before, only more violent and longer, and he seemed to endeavour as much as possible to stop it. The sobbing seems to originate in spasm of the glottis. Beef-tea enemata, and five grains of quinine every second hour by the mouth, were now prescribed. Dr. Todd saw him shortly afterwards, and desired this plan to be continued.

Twelve at night.—The patient complains that whenever he drops off to sleep, some breath of air brings on a spasm, when he starts up, dreading suffocation. He complains of fatigue, and longs for sleep. A screen has been put around his bed at his own request to keep the air off, though the night is extremely warm, and the other patients, covered only by their sheets, are tossing on their beds. The ice has relieved him very much; he was able, when Dr. Todd visited him, to hold the glass with water in his hand and look at the fluid.

Second day.—More irritable this morning, spits a good deal, and the sobbing respiration is almost constant. His countenance is paler than yesterday, and his expression anxious and distressed, more seemingly from constant annoyance than from any special pain. He refuses the enema, as it brings on a spasm. Pulse 128.

One P.M.—Became very violent, attempted to jump out of the window, and spits vigorously at every one; he bites, and is very fierce. After his dash at the window, (which was excited by the pupils coming in with Dr. Budd,) the poor man was secured and placed upon his bed, chloroform being at once administered. When fully narcotized, he was conveyed up-stairs into a private room, and there secured on the bed, when he began to spit round him to an excessive degree, and tried to bite his own hands, the sheets, &c.

He was given, by the stomach-pump, equal parts of beef-tea and wine; and by the rectum, quinine and opium. The patient was now kept for about eight hours under the influence of chloroform, a drachm being used at a time; and when he was occasionally allowed to recover, the spasms of the neck immediately occurred. He had slight episthymosis, and towards ten at night he began to throw up dark matter like the black vomit of yellow fever. He voided a good deal of it, and the fluid at last choked him.

*Post-mortem examination on June 27th, 1854, about sixteen hours after death, furnished by Mr. CONWAY EVANS, one of Dr. Todd's clinical clerks.*—The body, which was that of a well-nourished, rather muscular man, in the prime of life, was considerably congested; the face very much so, in fact, almost as if death had occurred during an epileptic convulsion. It was still under the influence of the rigor mortis. The scars of the bites (described in the case) on the front and back of the left hand were quite distinct; perhaps the one on the back of the hand was rather more blue than cicatrices of similar duration usually are, but certainly not very different-looking from an ordinary scar, being perfectly healed up, and presenting no trace of redness or tendency to open. The conjunctivæ were highly injected and some blackish-looking stuff ran out of the mouth, exactly similar in appearance to that which was vomited a few minutes before death.

It may here be observed that all the results of the post-mortem inspection were of the most negative character, and it seems not improbable that the extreme degree of congestion of most of the organs—brain, spinal cord, lungs, liver, kidneys, &c.—together with the black colour of the blood, were due in great measure, if not entirely, to the large quantity of chloroform continuously inhaled by the patient during the last eight hours of his life.

The skull and spinal canal were most carefully opened; nothing abnormal could be detected about the membranes of the cerebro-spinal centres, except that the pia mater was everywhere more congested than natural. A very small quantity of a clear, serous fluid was contained in the sub-arachnoid space. The arachnoid membrane (both the visceral and parietal layer) appeared quite healthy. The brain was plump and firm throughout. Both this organ and the spinal cord were most carefully sliced by Dr. Todd, but the only morbid appearance which could anywhere be detected was a state of very great congestion, more particularly of the grey matter, not of that of the hemispherical convolutions only, but of the grey matter generally—viz., in the corpora striata, loci nigri, cerebellum, medulla oblongata, and in the cord itself—being everywhere considerably darker than natural. The lateral ventricles contained a very small quantity of a clear,

serous fluid, and the white matter of the hemisphere (centrum ovale) presented in section a greater number of bloody points (divided bloodvessels) than is usually met with. Under the microscope nothing abnormal could be detected in any of the parts of the brain or spinal cord, which were subjected to examination, except that the minute cerebral and spinal vessels were everywhere highly distended with blood. The nerve-tubes, and the intervening granular and nucleated substance, exhibited no appreciable difference from the same structures in a healthy brain and cord.

The blood was everywhere very dark, almost black, and fluid; but its microscopical characters were precisely those of this fluid in a normal state. The lungs were gorged with black, fluid blood, but freely crepitant throughout; the heart, both as to its size and condition, and also that of its valvular apparatus, appeared and quite healthy. There was some degree of vascular congestion about the back of the pharynx; and the mucous membrane lining the interior of the larynx was also, perhaps, redder than natural, but only in a very slight degree. The mucous membrane of the stomach and intestines generally was highly congested; but this was the only appreciable change in these structures. The spleen was of the normal size, but rather softer and blacker than natural. The liver was of the normal bulk and consistence, but it presented somewhat of a nutmeg appearance, and was much congested. It was examined microscopically by Dr. George Johnson, whose report of it is this:—

"The liver-cells are very abnormal in appearance, being very white, granular, and opaque, the nuclei being indistinct, and very few of the cells having any oil in them." The kidneys were of the natural size and weight, but were highly congested. They were of the normal consistence, their surface smooth, and the lobular markings quite distinct. They were also examined by Dr. G. Johnson, who thus reports of them:—"The kidneys have the appearance of dark, vascular congestion. The Malpighian vessels are red to the naked eye, and also clear and red under the microscope. The minute renal arteries are of the normal thickness, and the intertubular capillaries clear and congested; there is no blood in the tubes, neither are there any hemorrhagic spots visible to the naked eye. There is no appearance of desquamation, nor are there any denuded tubes; but here and there a tube can be seen containing a fibrinous plug. The renal epithelium is everywhere present, but is less defined, whiter, and in some tubes less bulky than normal." "It seems to me," adds Dr. Johnson, "that the granular tubercles observed in the urine of this patient a few hours before death must have come from the epithelial cells, and not from the Malpighian bodies—a result of a modified nutrition of cells."

There was not, in this case, any attempt at cauterizing the wound, and the bite being soon forgotten no sort of fear or apprehension can have acted as an exciting cause of this distressing disease. We have therefore before us the immediate results of the introduction of the virus into the economy, and also very striking symptoms about the dog. It will be perceived that the animal was irritable and snappish, but did not evince much dread of water—a circumstance which we mentioned above as being of a very frequent occurrence. It is stated in the report that the dog snapped at the hand of the patient's wife, though it is not distinctly asserted that a bite was inflicted upon her. But it is well known that she might have been bitten, and still have escaped, as it would appear that the wound must be of a certain depth, and the animal peculiarly irritated, for the effects of the poison to become manifest. The horror of water was extremely well marked in this case, and the sight of the fluid gave rise to symptoms of a very bad character. But this dread of water and difficulty of swallowing have been known to be very slight in some cases. Wine or broth were even taken, and patients have been able to look at water in a dark vessel; but when a clear glass was presented, the spasms were at once excited.

The poor man did his best in the present case to overcome the spasmodic terror inspired by the sight of water, and "by a powerful effort he snatched the glass with both his hands, lifted it to his mouth, and threw some of the water down his throat." These struggles are really fearful, and remind us of a description of similar efforts written by Dr. Marcet. This author expresses himself as follows, (in the "Medico-Chirurgical Transactions," vol. i. p. 168):—

"On our proposing to him (a patient suffering from hydrophobia) to drink, he started up and recovered his breath by a deep, convulsive inspiration; yet he expressed much regret that he could not drink, as he conceived the water would give him great relief, his mouth being evidently parched and clammy.

On being urged to try, however, he took up a cup of water in one hand, and a teaspoon in the other. The thought of drinking out of the cup seemed to him intolerable; but he seemed determined to drink with the spoon. With an expression of terror, yet with great resolution, he filled the spoon, and proceeded to carry it to his lips; but before it reached his mouth his courage forsook him, and he was obliged to desist. He repeatedly renewed the attempt, but with no better success. His arm became rigid and immovable whenever he tried to raise it towards his mouth, and he struggled in vain against this spasmodic resistance. At last shutting his eyes, and with a kind of convulsive effort, he suddenly threw into his mouth a few drops of the fluid, which he actually swallowed; but at the same instant he jumped up from his chair, and flew to the end of the room, panting for breath, and in a state of indescribable terror."

There is much similarity between the immense efforts of the patients both in Dr. Marcet's and Dr. Todd's cases; but it would appear that the will, although determined, is conquered by the irritated state of the nervous centres. The fits of violence and the attempts to bite are, however, peculiar to the case treated at King's College, for this propensity is not general with hydrophobic patients.

The question then arises, Whether a bite from a human being in this state could be the means of conveying the disease to another person? We are inclined to think that such a wound would be harmless, but willingly concede that the data hitherto collected are not sufficient to warrant any conclusion on this head.

From the present melancholy case, as from all those which have preceded it, the sad fact is made evident that treatment is powerless in arresting the course of the affection, which clearly tends to a fatal issue. Where spasms are so violent, we naturally look to sedatives, and it will be seen that chloroform was largely tried, as the patient was, with short intermissions, kept eight hours under its influence. But scarcely had the effect gone off, than the spasms were as violent as before. Nor is opium more efficacious, as it is reported to have failed in a case where fifty-seven grains were given in fourteen hours. No better results have been obtained from the injection of warm water into the veins; bleeding to faintness; galvanism, as suggested by Rossi, of Turin; chlorine, both to the wound and internally; belladonna, as recommended by Pliny, &c. And yet *boni fide* cases of cure have been recorded; here is one, published in a Spanish medical journal, called the *Siglo Medico*, of the 21st of May, 1854, p. 162.

"A young man was bitten on the left hand by a dog presenting all the symptoms of rabidity. Cauterization only took place the next day, and he was then made to take belladonna-root. Three weeks afterwards, the patient suffered an attack of entero-peritonitis, and in the subsequent week he became agitated, restless, and irritable. The voice was deep, and the pulse hard, irregular, and frequent. These symptoms became more and more marked, and towards evening the patient fell into a state of great heat, with a choking sensation in the chest and throat; there was also dyspnoea, photophobia, thirst, and refusal of liquids, as attempts to drink aggravated the constriction about the throat. Intelligence, however, remained clear. Dr. Guisan now bled the patient again, (the first venesection had been used to combat the abdominal inflammation,) and prescribed calomel and opium. The man was considerably agitated during the night; he was again bled the next day, and took, every fourth hour, a pill, containing the one-sixteenth of a grain of arseniate of soda. The fits were numerous during the day, and one lasted four hours; the spasms were principally attacking the throat, and the limbs were convulsed. Matters became worse in the night, and the patient's life was almost despaired of. On the third day the fits continued, but were less violent, and not so numerous. On the fourth day, a visible improvement took place, and convalescence was soon established."

One might perhaps doubt, in reviewing the facts of this case, the real hydrophobic nature of the affection; for we know that fear and apprehension will give rise to symptoms almost similar to the disease in question. On this head we may mention the following fact:—"A young man was bitten by a dog which he fancied was mad, and on the fifth day evinced symptoms of hydrophobia, of which he was nearly dying when the dog which had bitten him was shown him, perfectly well. The intelligence tranquilized him so effectually that he was quite well four days afterwards."—(*Italian Journal of Physics*, January, 1817.)

We now turn to the case treated at the Charing-cross Hospital, the particulars of which were kindly furnished by Mr. Diamond, house-surgeon to the institution.

## CHARING-CROSS HOSPITAL.

HYDROPHOBIA; DEATH; AUTOPSY.

(Under the care of Dr. ROWLAND.)

ELIZA ANN F—, aged eleven years, of a nervous, excitable temperament, was admitted July 3rd, 1854.

*History.*—On May the 30th, the weather being very hot, (thirty-two days before the first symptoms of hydrophobia,) while returning from an errand, the child was bitten in the face by a dog belonging to a neighbour, which seized her on the bridge of the nose with the upper jaw, and on the inside of the upper lip with the lower jaw. It should be noticed that the animal was at the time after a bitch in heat. While taking her to a surgeon, her friends saw the owner of the dog, and on apprising him of the circumstance, he immediately sucked the wound on the nose (which was then bleeding freely,) within twenty minutes of the bite. The surgeon prescribed an aperient draught, and a lotion to apply to the wound, which soon healed up without any bad symptoms. *The wound in the lip was not treated.* The dog was being driven out of the house as the child entered the passage, and the parents say that the dog bit several children about this time, but they do not know where these young people lived. The animal has not been killed. On Sunday night, July the 2nd, (thirty-one days after the injury,) the girl first showed a disinclination to take tea, but she ate a small piece of cake, drinking nothing with it, but still evincing no particular repugnance to fluid. She refused her supper, complaining at the same time of a sore throat, and went to bed as usual. On the next morning, at about 3 A.M., the mother, who slept in the same room, was awakened by the child sobbing violently, and thinking she was under the influence of a dream, she awoke and soothed her, after which the child again slept till about 5 A.M., when the sobbing returned, accompanied by slight spasmodic twitchings of the limbs. As the little girl was frequently in the habit of being awakened by dreams during the night, the real cause of her restlessness was not suspected; the mother quieted her again, and laid her on the bed, where she remained till called at half-past eight. She evinced a great disinclination to rise, saying that her legs, arms, and head were aching, and complained of pain on the inner side of the upper lip. On attempting to stand, she seemed unable to walk, but being gently shaken, she revived, and went into the yard to wash, as usual. She stated that her throat felt as if she had hurt it, and that this uneasiness had existed for some days. Thinking she was gone a long time, the mother went out, and found her standing in the yard unwashed. She inquired the reason, and the child answered, "I can't! I can't! indeed, mother!" The latter begged the child to try, upon which she made an effort, but was at once seized by a convulsive fit, and unable to accomplish the ablation. The patient then came in to breakfast, and on refusing her tea with the same convulsive horror, and complaining of soreness of the neck, the true nature of the case was suspected. A surgeon of the neighbourhood, to whom the child was forthwith taken, at once advised her removal to the hospital, and she was accordingly conveyed here in a cab, and admitted under the care of Dr. Rowland. The child was strongly impressed after the occurrence that she should go mad from the bite.

(To be continued.)

## METROPOLITAN FREE HOSPITAL,

DEVONSHIRE-SQUARE.

THE following reports should have been published last week; they were, however, received too late:—

*Diarrhoea.*—Dr. Ramskill states, that in simple and new cases the dilute sulphuric acid, in half-drachm doses, has generally succeeded. Wherever chalk mixture had been given, any subsequent treatment by sulphuric acid failed; and if the acid were continued, symptoms of dysentery, with sanguineous evacuations, not unfrequently appeared. Chalk mixture in some instances seemed to aggravate the disorder. Gripping and cramps often remained after the diarrhoea was arrested by both the acid and chalk modes of treatment. Whenever from any cause previous treatment had failed in arresting the evacuations or subduing pain, the following combination succeeded: infusion of krameria, lime-water, of each four to six drachms; chloric ether, from five minims to a drachm; tincture of opium, six minims to half a drachm; to be given every hour until signs of amendment become manifest. In children, amongst

whom the epidemic has been very active, the same kind of treatment proved specific, and chalk mixture all but useless.

*Cholera.*—Dr. Ramskill has not seen any case in the advanced stage; all others have yielded to the treatment by sulphuric acid, in alternate doses with ether and laudanum, the application of the cayenne pepper foot-bath, and sinapiams to the stomach.

Dr. Barnes has chiefly employed the following formula: dilute nitric acid, ten minims; tincture of opium, two minims; water, one ounce; to be taken every three or four hours. He lays great stress upon rest, and abstinence from solid food, which might irritate the intestinal canal. In children and young infants, in whom it is desirable to avoid opium, Dr. Barnes speaks favourably of the following: dilute nitric acid, from two to five minims; nitrate of potash, from two to five grains; mint-water, from one to two drachms. The warm bath is especially serviceable. When the diarrhoea is subdued, the treatment subsequently required is not always the same; generally alteratives, or salines and bitters, occasionally combined with chloric ether, are of great benefit.

## ST. GILES'S INFIRMARY.

MR. BENNETT, surgeon to this institution, informs us that in many cases of cholera in the last stage admitted there, the patients have been recovered by wrapping them in blankets wrung out of boiling or hot water, and then sprinkled with spirit of turpentine. In some instances this treatment has not proved successful; but in many, reaction at the surface of the body occurred in half an hour, and the benefit derived has been such as to give Mr. Bennett considerable confidence in the practice.

## Reviews and Notices of Books.

*Clinical Handbook of Auscultation and Percussion; an Exposition from First Principles of the Method of Investigating Diseases of the Respiratory and Circulatory Organs.* From the German of WEBER. By JOHN COCKLE, A.M., M.D., F.R.C.S. London. 1854. pp. 137.

THERE are few subjects now of which we have more various, satisfactory, and, we may say, (in reference to the present state of science) complete, expositions, than of the physical diagnosis of diseases of the respiratory and circulatory organs. Happily, too, for the student, he has been especially well cared for by those who have devoted their attention to this branch of our professional literature. But whether for student or practitioner, the science of Medicine, or its practical application as an art, the labours of Hope, Williams, Stokes, Latham, Walshe, Hughes, Davies, and others, and the translations which have appeared in our own language of Barth, and Roger, and Skoda, are too widely appreciated to need anything beyond mere mention of them here. To that class of works upon the matter before us more particularly suited to the student, is now added the present translation of Weber's well-known little manual, by Dr. Cockle, and which addition we may confidently say, notwithstanding our already valuable manuals, is one for which the student will be thankful. The translator had added to the usefulness of the original work by introducing into the body of it some diagrams from Piorry's "Atlas de Plessimétrie." The lines of direction traced over the thoracic and abdominal surfaces, for the purpose of percussion, being based upon very great experience, have been regarded as peculiarly valuable, as recalling at once to the student's mind the organs situate along the line; any one of these organs, from the changes to which it is liable, often sensibly modifying the sound of those which are contiguous. A portion of Bock's recent work, ("Manual of Diagnosis,") with plans of the viscera *in situ*, and having reference to the subject of percussion, has also been translated and inserted by Dr. Cockle in the present treatise. The translator deserves praise for the explanatory and other notes he has appended to the text. They are not overdone, and always have a direct and practical bearing upon the subject, a point not always deemed necessary to be kept in view by some annotators. The following advice

of Dr. Cockle to the student appears to us exceedingly pertinent in these days, when there are so many *specialités*, the followers of which are sometimes too apt to exaggerate their own particular pursuit above every other:—

"1st.—To regard auscultation and percussion only as means to an end, and not as an end in themselves: they but constitute parts of the armament of the practical physician.

"2nd.—In commencing the study of physical diagnosis, either of the thorax or abdomen, to avoid any attempt at over-refinement in the use of the stethoscope and plessimeter.

"3rd.—Never to infer the non-existence of disease, from inability to detect its physical signs.

"4th.—Where it is possible, always to test the physical by the vital signs.

"5th.—Not to attach an undue importance to slight modifications of sound, either stethoscopic or percussorial, unless such changes be *progressive*."

Before dismissing the "Clinical Handbook" with our approval, we presume we should thank its well-known publisher, Mr. Highley, for including it in his "Library of Science and Art."

*Sketch of the Life and Character of Dr. Abercrombie.* Read before the Harveian Society of Edinburgh, at the Annual Festival, April 12th, 1854. By DOUGLAS MACLAGAN, M.D., F.R.S.E., &c. Reprinted from the *Edinburgh Medical and Surgical Journal* for July, 1854. Edinburgh. 1854. pp. 31.

THERE are few lately deceased members of our profession of whom more honourable mention can be made than the subject of Dr. MacLagan's biographical sketch. In the paths of literature, science, and of morals, he was well known, and as a *practitioner* held in very high repute in the northern portion of our island. The southern, though debarred his direct clinical assistance, testified its high respect for his numerous qualifications, by bestowing upon him, in 1835, through the University of Oxford, the degree of M.D., by *diploma*, (as also upon Dr. Prichard,) an honour which had not been bestowed upon any one, with the single exception of Dr. Jenner, for nearly fifty years previously. As a practitioner, one of his more prominent characteristics may be said to have been a full and quick appreciation of what were the essential points in the case before him; as a scientific author his classic works on "Diseases of the Brain," "Spinal Cord," and "Affections of the Abdominal Viscera," raise him to the highest rank as a clinical pathologist, (in his day a morning's work with a microscope in a study did not make one;) and as a moralist he was, to use the words of his biographer, "one zealous for the diffusion of useful knowledge by his writings, religious in profession, and pious in life," and merited what he received at the hands of his fellow-townsmen, "that good name which is better than precious ointment."

There is another aspect yet under which Dr. Abercrombie may be viewed—viz., as a philosopher, and as obtaining a repute in this respect, chiefly by virtue of his work on the "Intellectual Powers and the Investigation of Truth." On his position here we have a few words to say, because we think an erroneous and exaggerated view has been taken of it by very many, not that Dr. MacLagan is thus guilty: quite the contrary, for he coincides in the judgment passed on his work by the *Medico-Chirurgical Review* (April, 1831.)

The true value of Dr. Abercrombie as a *philosopher* has been best given, (in our opinion,) however, by Mr. Morell,\* who thus writes:—"That there is great intelligence, a tone of lofty morality, and much sincere piety, pervading his writings, we are glad to admit, but as works of philosophy they can never occupy any other than a very inferior position. With the real history of metaphysics, with its more lofty speculations, with its sublimest theories, the author was manifestly entirely unacquainted.....His work only reminds of Reid, without his depth; of Stewart, without his learning; of Brown,

without his genius." We are bound to admit, however, that Abercrombie *himself* never aspired to rank as a *philosopher*. His friends pushed him into the temporary reputation of one, and they must therefore hear our judgment as to its propriety.

*Moffat: its Walks and Wells. With Incidental Notices of its Botany and Geology.* By WILLIAM KEDDIE. And Report on, and Chemical Analysis of, its Mineral Wells. Prefaced by General Remarks on Water, &c. &c. By JOHN MACADAM, F.R.S., S.A., &c. Glasgow. 1854. pp. 163.

*Harrogate and its Resources—Chemical Analysis of its Medicinal Waters.* Report addressed to the Chairman of the Harrogate Water Committee. By A. W. HOFMANN, F.R.S., &c. With an Appendix on the Modes of their Administration by the Committee. 1854. pp. 54.

It may be opportune at this season, when so many are seeking health and recreation at our mineral springs and spas, to direct the attention of the reader, who may require information, either of a scientific or local character, concerning the chief sulphurous springs of England and Scotland, to the above tracts. Messrs. Keddies and Macadam's labours here take a very agreeable form, and, whether for pleasure or for profit, their little work may be well recommended.

The Report on the Springs of Harrogate is chiefly confined to the able analysis by Dr. Hofmann of their waters, the Medical Committee appending some remarks on their therapeutic application.

## THE UNIVERSITY OF LONDON MEDICAL GRADUATES ACT.

*An Act to extend the Rights enjoyed by the Graduates of the Universities of Oxford and Cambridge in respect to the Practice of Physic to the Graduates of the University of London.*—August 11th, 1854.

WHEREAS a body politic and corporate, by the name of the University of London, has been constituted by the Royal Charter of her present Majesty, with power after examination to confer the several degrees of Bachelor of Medicine and Doctor of Medicine; And whereas it is expedient that such and the same privileges relating to the practice of physic as are enjoyed by Graduates in Medicine of either of the Universities of Oxford and Cambridge, by virtue of their degrees, or under any authority or licence now conferred upon them by either of the said last-mentioned Universities, should be enjoyed by the Graduates in Medicine of the University of London: Be it therefore enacted by the Queen's most excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:

I. *Graduates in Medicine of the University of London, to be entitled to practise physic in the same manner as Graduates of the Universities of Oxford and Cambridge.*—Every Bachelor of Medicine and Doctor of Medicine of the said University of London, shall, by virtue of his degree, and without the necessity of undergoing any further examination, or of obtaining any further authority or licence, be forthwith entitled to practise physic, as fully, effectually, and extensively in all respects as any Bachelor of Medicine or Doctor of Medicine of either of the said Universities of Oxford and Cambridge is entitled to practise by virtue of his degree, or under any power, licence, or authority now conferred by either of the said last-mentioned Universities: Provided always, that the privileges hereby conferred shall not be construed so as to extend to the practice of surgery, pharmacy, or midwifery.

II. *Graduates in Medicine of the University of London indemnified for having acted without having obtained authority from Universities of Oxford or Cambridge.*—And whereas it is apprehended that divers Graduates in Medicine of the said University of London are, or may become, exposed to divers forfeitures, pains, or penalties, by reason of their having practised physic in all or some or one of its branches, or of their having done acts as or under the description of physicians or practitioners of physic, in all or some or one of its branches, without any other qualification for so doing than their having studied for and obtained the medical degrees of the last-mentioned University, and in particular it is appre-

\* An Historical and Critical View of the Speculative Philosophy of Europe in the Nineteenth Century. Vol. II., p. 49.

tended that under the Act passed in the session of Parliament held in the sixteenth and seventeenth years of the reign of her present Majesty, chapter ninety-six, and the Lunatic Asylums Act, 1853, any Graduate of the University of London practising as a physician, if not otherwise answering to the definition of a physician set forth in the interpretation clauses to such Acts, who may have signed any certificates under those Acts, or either of them, in which he shall have been described as a physician, is liable to be indicted for a misdemeanour: Be it enacted, That all such Graduates in Medicine of the said University of London who have so practised physic, or have so done any such act, or signed any such certificate as aforesaid, shall be indemnified, freed, and discharged from all such forfeitures, pains, penalties, and disabilities as they would or might have been exempt from had they taken their several degrees at, or obtained authority or licence to practise from either of the said Universities of Oxford and Cambridge, and that all such acts and certificates heretofore done or signed by any Graduate in Medicine of the said University of London shall be deemed to all intents and purposes as valid and effectual as if this Act had passed previously to the doing or signing such acts and certificates respectively.

III. *Short Title.*—This Act may be cited as "The University of London Medical Graduates Act, 1854."

## BICHLORIDE OF MERCURY IN CHOLERA.

To the Editor of THE LANCET.

SIR,—I read with much pleasure, in THE LANCET of Saturday last, the suggestions of Mr. Wearne with regard to the use of the bichloride of mercury in cholera. Your correspondent will be glad to learn that Mr. Rumbold, of Eldon-street, and myself have been in the habit of using this remedy for some time past, and that its administration has been followed in several cases with signal success. In justice to Mr. Rumbold, I must state that he was the first person who suggested to me the value of the remedy in question. The same arguments which led Mr. Wearne to recommend its use were those which occurred to my own mind. In severe cases of cholera calomel is useless. We want a soluble and powerful cholagogue, capable of acting immediately on the liver. In the year 1832, when I saw more of cholera in Scotland than I have ever seen since, and more than I ever hope to witness again, calomel was at one period of the epidemic the medicine most in vogue. It was, however, abandoned by many medical men, in consequence of the serious results which often followed its use. Large quantities of calomel, which remained perfectly inert during the stage of depression, often produced a deleterious influence when reaction was established, and at a time when its specific action was not required. Sloughing of the rectum was a common occurrence.

In severe cases of cholera I give one-eighth of a grain of the bichloride, combined with ten minims of laudanum, and repeat the dose every one or two hours, until green motions appear. I then suspend its use. It must not be forgotten that the remedy is a highly dangerous one, and that it should be administered with due caution.

A most severe case of cholera, which very recently came under my care, evinced in a striking manner the efficacy of the bichloride. The patient, a young man, twenty-one years of age, was seized with shivering, and in seven hours the worst symptoms of cholera were developed. Slight reaction had taken place when I was called in, but vomiting and purging continued, and the tongue was cold. I gave the one-eighth of a grain of bichloride, combined with laudanum, every two hours. After four doses the evacuations became green.

This patient lived in a house to which there was neither surface nor underground drainage. Should such a state of things be suffered to exist in the first metropolis in the world, and in the nineteenth century?

For the two following cases I am indebted to the kindness of Mr. Rumbold:—

"A gentleman, aged thirty-eight, occupied at Billingsgate, and living in the City, after partaking freely of lobster in the evening, was seized with distressing diarrhoea about two o'clock the following morning, (August 22nd.) When seen at five A.M., he stated that his bowels had been acted on between twenty and thirty times, the motions then having the appearance of rice-water; slight nausea, but no vomiting; pain in epigastrium; great depression; coldness of extremities, and slight cramp; countenance anxious, with a dark halo around the eyes. Ordered, liquor of bichloride of mercury, two drachms; tincture of opium, ten minims, with water. This was repeated in half

an hour, and ordered to be given every second hour; occasionally warm water and brandy, and bottles of hot water to the feet. The bowels were not again acted on for about two hours, when the motion evidently contained bile. By twelve (noon) he appeared comfortable; diarrhoea ceased. Ordered, aromatic confection, one drachm; compound tincture of cinchona, six drachms; aromatic spirit of ammonia, two drachms; camphor mixture, three ounces; one fourth part every four hours. The case terminated favourably.

"A female, aged fourteen, residing near Holborn, returned from the country, August 23rd. The following day she was seized with severe pains in the bowels, vomiting, and diarrhoea; complained of extreme chilliness and sensation of cramp. Ordered the bichloride of mercury and opium, as in the former case. After the second dose the matter vomited, from being similar to rice-water became green, and shortly ceased, as well as the diarrhoea. The treatment adopted was similar to that in the preceding case, and the patient recovered."

In cases where the bichloride is contra-indicated, might not large doses of the nitro-hydrochloric acid be of service?

I remain, Sir, yours obediently,

Finchbury-square, September, 1854.

J. M. WINN.

## TREATMENT OF CHOLERA BY SPIRITUOUS AFFUSION AND FRICTION.

To the Editor of THE LANCET.

SIR,—Permit me to add one more to the many suggestions already given forth touching the treatment of cholera. Having resided for the last three years in the city of New Orleans, and having been attached to the Charity Hospital of that city, I have probably had more numerous opportunities for witnessing the various forms of congestive and algid diseases than usually falls to the lot of practitioners in England. I wish therefore to draw attention to a mode of treatment which, common as it is with us in the south, seems comparatively unknown or unused here. I allude to our practice of external friction with some alcoholic stimulant. With us, in yellow and congestive fevers, in cholera, in typhus,—in fact, in all diseases characterized by extreme prostration and deficient circulation, it is as usual to prescribe for the exterior as for the interior of the body, and, from what I have seen, I think with great success. In these diseases we usually order the patient to be well rubbed over the whole body with whisky or spirits of wine, to which may be added, according to the exigencies of the case, spirits of camphor, tincture of bark, or aromatic spirit, and then to be thoroughly dried with a coarse towel, this alternate rubbing and drying to be done three times consecutively, and to be repeated at intervals varying from once every hour to once every three hours, or twice or thrice a day. In cases where the patient has almost seemed *in articulo mortis*, I have seen this adjunct to treatment produce the most surprising results, and even should it fail to cure, the sense of ease and of relief produced by it is (as I can state from personal experience) beyond description. By it the circulation is restored to its equilibrium, and the skin, hitherto cold and clammy, becomes immediately warm and moist; the patient is revived, and we have an opportunity of administering internal remedies with some better chance of success. The formula I would recommend is three parts of spirit of wine or strong whisky, add one part each of tincture of camphor, tincture of cinnamon, and tincture of bark, a sponge or flannel to be saturated with the mixture, and the patient to be well rubbed with it from head to foot, and then dried, as before directed; and I am convinced we should speedily find its benefit, not only in cholera, but in all forms of adynamic disease. At the same time, with regard to internal remedies in cholera, I may state I have found none so serviceable as salines, with occasionally a little mercury; and I have been in the habit of employing, with tolerable success, the following combination:—Muriate of ammonia, five grains; common salt, fifteen grains; to be dissolved in a tumbler of iced water, and given every hour, occasionally adding from the fifteenth to the twentieth of a grain of bichloride of mercury. In no disease, excepting perhaps the pernicious fevers of the tropics, is there so great a congestion upon internal organs as in cholera; and I conceive no plan of treatment can be so serviceable in relieving this, and in restoring the skin to its healthy action, as the one I have hinted at above, and which I have seen tried with such marked benefit.—I remain, your obedient servant,

J. L. CRAWFORD, M.D., M.R.C.S.E.,  
Fellow and Corresponding Secretary of the New Orleans  
Academy of Sciences, and Member of the State  
Medical Society of Louisiana, &c.

London, Aug. 1854.

# THE BRITISH MEDICAL DIRECTORY

## for 1855.

THE Members of the Medical Profession throughout Great Britain are earnestly requested to forward, *without delay*, to the Editors of the BRITISH MEDICAL DIRECTORY, the "Returns" of their Names, Addresses, and Qualifications, with other particulars, a form for which is below furnished, for insertion in the Directory for 1855.

In making the "Return" now requested, either of the forms No. 1 or No. 2 may be adopted. If the entry in the Directory for 1854 *be correct*, No. 1 may be chosen. If there be no entry for that year, or one rendering alterations necessary, then No. 2 should be selected, and the different questions answered as fully and as *legibly* as possible. Any Practitioner, having made his own "Return," would aid the Editors by procuring others from neighbouring Practitioners. An *immediate* attention to this appeal will be gratefully acknowledged by

THE EDITORS OF "THE BRITISH MEDICAL DIRECTORY."

P.S.—As the "Returns" must amount to many thousands, it is obvious that the postage would be a heavy charge on the Editors if they were to be posted without being *stamped*.

---

### No. 1.—Return when the Entry is correct in the BRITISH MEDICAL DIRECTORY for 1854.

To the Editors of the BRITISH MEDICAL DIRECTORY.

GENTLEMEN,—My Name, Address, and Additions are printed at page \_\_\_\_\_ of the Directory for 1854, and that Entry is fit for insertion in the DIRECTORY for 1855.

I am, &c. &c.

Name and Address {  
written at length { \_\_\_\_\_  
\_\_\_\_\_

---

### No. 2.—New or Amended Return for the BRITISH MEDICAL DIRECTORY for 1855.

1. Name, written at length, (the {  
Surname first.) { \_\_\_\_\_

2. Address. { \_\_\_\_\_

3. Medical qualifications, and where {  
and when obtained. {  
[The words in Italics should receive  
particular attention.]

4. Titles in any scientific or learned {  
Societies. { \_\_\_\_\_

5. Medical or Surgical offices held by {  
me. { \_\_\_\_\_

6. Honorary Appointments held by {  
me, Medical or otherwise. { \_\_\_\_\_

7. Medical Works of which I am the {  
author; their titles, and when and {  
where published. { \_\_\_\_\_

## POSTSCRIPT.

Any information which you may transmit, with respect to the death, change of residence, or the appointment to any public office, of any duly-qualified practitioner, would be gladly received.

---

The BRITISH MEDICAL DIRECTORY for England, Wales, and Scotland, to be published on the 1st of January next, may be obtained of all Booksellers and Newsmen. Price *Six Shillings*, (including 1s. postage.)

## THE LANCET.

LONDON: SATURDAY, SEPTEMBER 9, 1854.

THE ravages of the frightful epidemic by which the population of this metropolis is now assailed are advancing with marked rapidity, and they have already attained an alarming height. In two or three localities, not hitherto considered to be peculiarly unhealthy districts, the destruction of human life, within a very brief period, has been absolutely appalling.

We notice these occurrences at this time, and in this place, for the purpose of directing professional and public attention to what we believe to be a prolific source of mortality at this and at former periods. In the Registrar-General's Report just published, we find that the deaths in the last week, within the limits of the metropolis, were 2515. Of course it is known that the "returns" are obtained from the registrars of the several districts, whose entries are made in conformity with the causes of death described in the certificates of qualified medical practitioners. Now, it will be seen that the number of deaths from CHOLERA, registered from these official sources in the last week, are stated to have been 1287, and that the deaths from DIARRHŒA during the same period amounted to 243. Why, we would ask, is Cholera thus designated by two titles or names?

The public safety imperatively demands that this pernicious and fatal practice should at once be abandoned, and that the people should be told the simple and naked truth, so that they may boldly encounter the danger that threatens them, and resort at the earliest possible moment, when attacked, to the protective aid of medicine. The security of life at this juncture demands that every person who suffers from diarrhœa should be induced to believe that his complaint is Cholera and nothing else, and that not an hour—not even a minute—should be lost in seeking for competent medical aid. When people find that, out of four or five hundred cases of what are denominated *Diarrhœa*, there are only four or five deaths, they often foolishly and fatally calculate that there are ninety-nine chances out of one hundred in favour of their speedy recovery; altogether forgetting that when the complaint assumes a more serious form, and exhibits the frightful symptoms which frequently precede the hour of death, the term *Diarrhœa* is abandoned and the title Cholera is substituted—both terms being used to designate the same disease at different periods of its existence. Confident are we that thousands of lives have fallen sacrifices to this fatal and irrational system. All the established rules and principles of pathology alike decree that one disease should only be known by one nosological title. Cholera thus viewed, seeing how many thousands who are attacked are cured when medical aid is promptly sought and obtained, ought not to create any great amount of public apprehension, except it be the fear of neglect. Every person, therefore, should know and feel that sickness and purging are the first symptoms of malignant Cholera, and even that either of them occurring alone is a characteristic of that disease, and that medical advice should be obtained at once and without a moment's delay. Sincerely, therefore, do we hope that the practice of designating Cholera

as *Diarrhœa*, and thus lulling the public into a false security, will be at once abandoned by all the qualified members of our profession.

HAPPILY for the public safety at this critical period, the New President of the Board of Health is pursuing his duties with great energy and discretion. He has appointed a staff of Medical Inspectors well-qualified for their office, and by whose labours much good has already been effected. In the districts which have been more especially affected by the epidemic, the authorities, acting in unison with the Board of Health, have resorted to every possible means to arrest the progress of the disease. In the parishes of St. James's and St. Ann's, Westminster, in some localities of which the Cholera has exhibited unusual marks of severity, in addition to house-to-house visitations and the inspection of nuisances, the streets have been strewn with quick-lime, and afterwards washed down. In every instance which has come within our knowledge, the Boards of Guardians have readily carried out the suggestions of the Inspectors. In the two parishes named this has been especially the case, and we can speak from personal observation of the benefits which have resulted from the steps which have been taken. The latter parish is divided into four districts, to each of which a surgeon is appointed. He has also under him a "medical house-to-house visitor," who immediately reports all cases of severe disease to his principal, and orders medicine for the milder forms of the complaint. The plan of placing the "visitor" immediately under the direction of the medical officer is a very judicious step, and is found to act most beneficially. We attribute much of the cordiality which prevails amongst the authorities to the conciliatory manners of the inspectors, who have conducted their onerous, and sometimes unpleasant, duties with great tact and ability. The Board of Health is now treating the subject practically, and in a manner which will effectually test the value of the system. It may be premature to speculate upon the ultimate effects of the measures resorted to; but it is to be hoped that the experience of the present epidemic will operate in such a manner upon the authorities as to induce them to attend more systematically to the sanitary condition of their various districts. An organized staff, there is good reason to believe, had it existed in some districts long ago, might have materially mitigated the severity of the present visitation. We approve of the vigour with which the progress of the disease is contested; but let us for the future have the citadel always in a state of defence, and not combat under the disadvantage of having the enemy within our gates, whilst we have been awakened from our slumbers into a state of alarm.

THE ministrations of the healing art are of that beneficent and ennobling character, that the disciple of Medicine finds the acquisition of the power of relieving the sufferings of his fellow men, and the desire to exercise that power grow up simultaneously in his mind. He too often forgets that too much readiness to proffer his services to all comers not unfrequently becomes a dereliction from the principles of true charity. Relief lightly given is lightly taken. The recipient soon learns to estimate at the meanest rate the value of the benefit he has experienced. If we could fathom the sentiments of the great mass of those who throng around the consulting-tables of our hospitals, we

strongly suspect that gratitude would not be frequently discovered. That is, they may be glad enough that they get cured of those ailments which misfortune, poverty, or vice, may have brought upon them; they may be thankful that there are institutions where they may at any moment command the gratuitous services of skilful physicians and surgeons; but we doubt very much whether they very often experience, or at least long retain, any very lively gratitude towards the particular surgeon or physician who has given them his attention. It is known at what cost of time, of canvassing, of money, of independence, hospital appointments are obtained. The public consider these as the great prizes of the profession. The candidate addresses the governors in the most obsequious phrases: he will be their very humble and obedient servant; he will devote himself—should he be honoured with their support in obtaining the object of his ambition—and all his energies to the service of *their* noble institution. Yes, the institution is the institution of the governors. The medical officers who have struggled for the questionable honour and certain toils of dispensing the charity of the governors—charity measured, perhaps, by an annual guinea—are held to be amply requited by the privilege of giving gratuitous advice. Have they not obtained “the object of their ambition?” Ought they not to be thankful? Did not they dedicate all their energies to the service of others? Is not their motto “*Labor ipse volupias?*”

When it is universally known that the profession so freely, nay keenly, and not seldom meanly, contest the opportunity of giving away their skill, time, and experience, can it be expected that these gifts should not be most grossly abused? The monstrous self-injury thus inflicted upon the profession has reached such dimensions that some decisive steps to counteract the growing mischief are felt to be imperatively necessary. It is in reality one of the great questions of the medical community. It lies at the root of almost every other evil under which we suffer. The wide extent to which *gratuitous* medical relief is given, is the chief cause why *remunerated* medical advice is so truly inadequate. If hospital appointments, in which the incumbent reaps nothing but hard work, are so desirable, is not the Union medical officer happy indeed, who gets not only hard work, but pay into the bargain? And so it is throughout the whole career of the medical practitioner. He is constantly forced to accept insufficient remuneration for his services, constantly called upon to submit to some indignity, some sacrifice of independence, because medical services can be had elsewhere for nothing. The evil reactions of this system are thus felt at every turn.

We have said that these evils are now universally felt, and that a remedy is eagerly sought. The subject has engaged the anxious attention of individual members of the profession, and of several professional associations. All have unanimously joined in condemning the system. They have not, in our opinion, shown equal diligence in seeking for a remedy. It is a practical question. It must be dealt with in a practical spirit. General denunciations against those practitioners who give gratuitous advice, and against hospital medical officers, will do no good. We cannot all at once alter the constitution and administration of our public institutions. We cannot scrutinize too nearly the motives or the doings of private practitioners. We have no right to dictate to our neighbours so far as to say—you shall not give gratuitous advice. The evil is one of such

a magnitude that it is perhaps impossible to effect a radical and speedy reform. The real points to which the profession should steadily direct their view are, the discovery and appliance of checks which will gradually abate the evil, and tend to bring the system of gratuitous advice within the just limits of true charity and philanthropy. One measure alone would accomplish immense good. It is one for which we have often contended strenuously in these pages: it is the payment of the medical officers of hospitals and dispensaries. The direct effect of this upon the profession would be that these officers would be remunerated for their labour. The indirect effect would be of more general importance. It would tend powerfully to remove from the public mind that most mischievous belief, that the time and skill of the medical profession are public property. Another measure may be immediately put in operation. Exactly twelve months ago, when discussing this subject, we proposed a simple means of cutting off one obvious and great abuse to which our medical charities are subjected. We referred to the fact that there existed amongst the working classes a vast number of clubs, the leading feature of which is the allowance of a weekly sum to members incapacitated by sickness. To claim this sum a certificate of sickness is necessary. Men who, from real sickness, sheer idleness, or misconduct, are out of employment, present themselves before the medical officer of an hospital, get advice and medicine for nothing, and then ask for a certificate to enable them to draw the sick allowance from their clubs. We urged that these certificates ought invariably to be refused. Members of sick clubs are not destitute. These clubs ought to pay a regular medical officer to protect their funds against the claims of imposture. To give these certificates gratuitously is an injury to the professional body of the same nature as that of giving professional advice to an insurance company without a fee. The hospital physician or surgeon who gives such a certificate incurs a serious responsibility. He commits himself to a particular professional opinion which may be called in question, and which he may have to defend at his own cost. It is downright folly to be so wasteful of one's time as this. The utmost that a medical officer can be reasonably called upon to give is his medical advice. We do not hesitate to express our opinion, that had the advice we gave upon this subject a year ago been generally adopted, a most effective blow would by this time have been dealt against the abuse of gratuitous medical advice, and that without in the smallest degree obstructing the flow of pure charity.

We again invite the attention of the profession to this point, and urge our brethren to apply themselves to the practical task of devising other means of a similar nature, which can be immediately brought into operation, with the view of diminishing the evils of which they have so much reason to complain.

---

WHENEVER a senatorial philanthropist concocts a measure having for its object the extension of medical assistance to the community, he, without hesitation, and as the most natural thing in the world, takes into his calculations that he may command the gratuitous services of the medical profession. It would not very much astonish us if, next session, some noble lord, in the fervour of benevolence, were to introduce a bill to make it compulsory on every medical man in the empire to stay at home three hours daily for the purpose of giving advice

and medicines to all persons applying, and to devote three succeeding hours to the gratuitous visitation of those who might prefer being attended at their own homes! This would scarcely be going more than a step beyond examples of recent enactments now in full operation. In principle, the Lunacy Laws and the Compulsory Vaccination Act, which actually subject medical practitioners to pains and penalties unless they will submit to execute public duties for pittance which render the duties imposed a burthen and a ruinous exaction, differ in no respect from the principle of the measure we have supposed. Of late years, however, there have been many symptoms of a reaction in the profession not to be put upon too much. We begin to think that where the benevolent ministrations of our art are to be dispensed, we have at least a right to dispense them of our own free will, after our own fashion, and not according to the dictation of the State, or of Benevolence that stays at home and keeps itself warm. We begin to hope that the day is not distant when the relations of the medical officers of the Poor-law Unions to the Guardians will be materially amended. In the last session, our readers are aware that a Select Committee of the House of Commons sat to consider this subject. Its labours have not yet brought about any tangible result; but the question was fairly mooted, and we consequently invited the profession to make the best use of the recess in supplying any omissions in the way of information which the proceeding of the Committee might exhibit.

Mr. TATHAM, of Huddersfield, has forwarded a striking example of the manner in which Boards of Guardians may impose upon their medical officers. It appears that, under that remarkable sample of senatorial wisdom, the Compulsory Vaccination Act, the Guardians are called upon to appoint convenient places as intermediate stations, so as not to compel parents to bring their children more than two miles for vaccination. It is also provided that wherever the vaccinating surgeon shall be called upon to vaccinate at a distance of more than two miles from his residence, he shall be entitled to the munificent *bonus* of two shillings and sixpence a case. To obviate the necessity of paying this extravagant allowance, the ingenuity of Boards of Guardians is exerted in selecting places which shall be within the two miles. If they can manage this—the great point—they are not too solicitous about complying with the spirit of the Act, which is to save poor people long journeys and loss of time. The Huddersfield Guardians have even carried their economical policy beyond this. They not only instruct Mr. TATHAM to fix upon a station within two miles of his house, in a locality ill adapted for the purpose, and in total disregard of the convenience of the people who have to attend it, so they can but escape paying the higher rate, but they have the supreme assurance to call upon the medical officer to pay for the hiring of the station himself! Mr. TATHAM's remonstrances are answered in that peculiar logic in which Boards of Guardians are adepts. He is given to understand that if he does not think proper to submit to injustice—in the present instance we may say to extortion—he may resign his valuable appointment. They rely of course upon the belief that many gentlemen will rush forward, eager to fill his place. Mr. TATHAM's next step was to place the correspondence and the case before the Poor-law Board. He gets a civil official reply, but no satisfactory redress. Indeed, we suspect the instances are few in which an appeal to Whitehall has much benefited the Union surgeon.

The case of which we now give the leading facts is only one amongst many which prove to demonstration the hardships to which Union Medical Officers are subjected at the hands of Boards of Guardians. It is one of that kind of which every possible instance should be laid before Parliament in the ensuing session, in order to rest the movement for amelioration upon a broad basis of incontrovertible facts.

So long, however, as Boards of Guardians are allowed to make contracts with medical officers on the principle of grinding them down to the lowest tender; so long as the Guardians have a direct interest in exacting an unfair amount of labour for an absurdly inadequate remuneration, so long do we fear the medical officers will never assume their proper independence, or obtain a fair reward. The measure of Sir ROBERT PEEL, which transferred half the pay of the medical officers to the Consolidated Fund, is admirable in principle; but so long as *any portion* of the pay is left to the parsimony of Boards of Guardians to award, so long must this measure prove barren of any real good to the profession.

We can conceive two measures, either of which would lead to the emancipation of the profession from a degrading dependency upon Boards of Guardians and a more liberal scale of remuneration. The first, and probably that promising the most speedy relief, would be to transfer the *whole* of the salaries and remunerations of Union medical officers to the Consolidated Fund, leaving the Guardians no interest in, and no scope for, oppression. The second measure is one of a larger character, involving many wider questions, and which must therefore be discussed under a variety of different aspects. The measure we refer to is the consolidation of all the Unions in the empire, for the purpose of striking an uniform universal poor-rate. This measure need not involve the abandonment of local self-government, but it would deprive Boards of Guardians of all pretext for cutting down the salaries of their officers to a point below all decency and propriety.

If the profession wish to take up this matter with the determination to succeed in their object, they must not content themselves with proving their grievances: they must heartily and resolutely apply themselves to the practical end of helping forward the particular measures which will bring them relief. In this country of free opinions, and of free action, and of Government inertia, it is not enough for an aggrieved class to point out and lament its grievances. It must also discover the remedy, and never rest until that remedy is applied.

### TREATMENT OF CHOLERA.

To the Editor of THE LANCET.

SIR,—The ravages which cholera is now making amongst us induces me to make public the results of experiments, made with the view of ascertaining the nature of the disease, and the agents which might arrest its fatality or cure it. In this investigation of the nature of the disease, the blood and the discharges were carefully examined, and the conclusions arrived at were, that cholera consisted essentially in a vitiated or poisoned state of the blood, by which its vitality was so injured by the unknown poison of cholera, that its red globules ceased to be properly oxygenated, its fibrin ceased to be formed in normal quantity, and the natural secretions, by which its purity was at other times insured, were arrested. As a natural consequence, bile and urine ceased to be secreted, and the doubly-poisoned and irritant blood, circulating feebly, gave

rise to the general cramps, coldness, lividness of surface, prostration of strength, &c.; while the diminished vitality of the blood, combined with its want of fibrin, allowed its albuminous and fluid portions to ooze out on the surface of the mucous membranes, and thus caused that great and incessant discharge of flocculent, colourless matters, so characteristic of the disease.

Any remedial agent, therefore, which could change the nature of the poisoned blood, and restore the secretions of bile and of urine, would effect a cure. Many remedial agents were tried with this view, both on the healthy and the diseased; but the most efficacious, and by far the most rapid of all in its action, (and there is no time to lose in this disease,) was found to be *croton oil*. This substance excels all others in causing a rapid and full secretion of bile, and it was also found that the moment bile was thus secreted, the kidneys began to act, and thus still further cleared the blood of another poison which oppressed it—viz., the urea. The purging in cholera I have ever regarded as an effort of nature to throw off the disease; and the *croton oil* appeared to act as a perfect antidote to the cholera poison, not only clearing the blood of its poison through its action of the bowels, but restoring the secretions which had been suppressed by the disease.

The *croton oil* may either be given in pill or in castor oil. If in pill, six drops of *croton oil* are beat up with a scruple of the *colocynth* and *hyoscyamus* pill mass, and divided into six pills, and of these one may be taken every hour till a full evacuation of bilious matter is produced. If given with oil, eight drops of *croton oil* may be mixed with an ounce of castor oil, and of this a teaspoonful may be given every hour in port wine or milk, whether vomited or not, till bilious evacuations occur. Under the action of this medicine, it almost invariably happens that large quantities of bilious matters, or even pure bile, are vomited at the same time.

Diluted sulphuric acid, twenty or thirty drops in a wineglassful of water, and repeated every fifteen or twenty minutes if desired, often succeeds in arresting the severe retching and vomiting, and its efficacy in this respect is much increased by adding from five to ten drops of the sulphurous acid. These acids may be administered in all stages of the disease without interfering with the specific action of the *croton oil*. I have even seen mild cases of the true cholera recover under this treatment alone. Should the *croton oil* threaten to purge too severely, from twenty to thirty drops of laudanum may be given in a little brandy and water. Morphia appears to be of little or no use in such cases.

I am, Sir, your obedient servant,

JAMES STARK, M.D., F.R.S.E., F.R.C.P. Edin.

Edinburgh, September, 1854.

## THE NEW INDIA EXAMINING BOARD.

To the Editor of THE LANCET.

SIR,—I beg to inform you that the authority on which you rely for information regarding my having been Sir Charles Wood's counsellor in the selection of the present Board of Examiners, for determining the respective merits of the candidates who may compete for appointments in the Medical Service of the H.E.I.C., whether it may have been derived from private or official sources, is incorrect; and that the opinion you advanced of there having been unprincipled jobbing practised in the arrangements is, in my opinion, unjustifiable, and not founded on fact.

I was summoned to an interview with the President of the Board of Control, after he had made election of the members of the Examining Board, without having had any official information from the East India House on the subject, the proposed draft of the present regulations for examination, by the trial of unrestricted competition, having been merely submitted to me by the Right Hon. the President of the Board of Control for my suggestions. In that interview Sir Charles Wood named the Examiners he intended to appoint, from the very strong recommendation he had received of their qualifications. In my reply to him I stated that, for such a sifting trial I did not think that better men could have been chosen; that I had the pleasure of being acquainted with three of them, and though unacquainted with Dr. Hooker, that I had no doubt, in the department assigned to him, he would prove to be most ably qualified. I also said that, for talent, and the highest sense of probity, justice, and gentlemanly feeling, a better Board could not have been selected.

I must now state that when I communicated to Dr. Parkes, Messrs. Paget and Busk, that I had been desired by Sir

Charles Wood to inform them that he had determined on offering them the position of Examiners, and that he had expressed the wish that I should introduce them to him, they were most agreeably surprised, my intimation having been the first they had received on the subject. Does this look like gross jobbing on the part of those who recommended those gentlemen? In so far as I have observed, the arrangements made have been guided solely and simply by the desire of rigidly fulfilling the object of the new scheme—viz., to select, by the comparative trial of merit, at an unrestricted competition, the men best qualified in all respects, between the ages of twenty-two and twenty-eight, to fill the position of assistant-surgeons in the East India Company's service.

If the present Board may not succeed in giving satisfaction, the President of the Board of Control has the power to make such changes as he may deem fit, the appointments not being permanent; and I think it is the duty of the profession, the public, and the press to be subject to the powers that be, if such powers should be employed, (as they in this case appear to be,) with the sole view of the public good.

Trusting that this explanation will satisfy you that I am not a traitor to the medical officers of the East India Company's service, and that I am quite as anxious as my neighbours that the Presidencies of India should be well supplied in their medical department,

I am, Sir, your obedient servant,

Stratton-street, Sept., 1854.

JOHN SCOTT.

\*\* We regret that Dr. Scott's explanation is of such an unsatisfactory character. Upon his own showing, he had an interview with Sir Charles Wood before the recent appointments were definitively decided on by the President of the Board of Control. At this interview, he states that he gave a reiterated opinion in favour of the gentlemen subsequently appointed. The value of that opinion may be inferred from the fact that it was quite as strong in support of Dr. Hooker, whom he did not know, as of those who were well known to him. It is evident that Dr. Scott considers three or four junior members of the profession in London better fitted to form a Medical Examining Board for India, than physicians and surgeons of the highest distinction in the Indian service! To this we demur. Dr. Scott's humble reverence for "the powers that be" is mere twaddle. Sir Charles Wood will be called upon in Parliament to explain the steps which led to the very improper appointments he has made. Meantime, the profession are universal in referring this proceeding to Dr. Scott, Sir James Clark, and Sir John Forbes. After the letter of Dr. Scott, it is for the Directors of the East India Company to say whether that physician acts in the manner best calculated to promote the interests of their service.

To the Editor of THE LANCET.

SIR,—Concurring entirely in the just remarks you have made respecting the great Indian job recently perpetrated, and upon which your observations appear by no means too severe, I am still inclined to believe, notwithstanding the very strong claims the Company's own medical officers possess to become examiners, that it would not be fair to the profession in this country were such important appointments exclusively confined to that service. Certainly, half the examining board should be composed of men, like Mr. Martin, who had distinguished themselves by efficient services in India; whilst the remainder ought, I also consider, to be chosen from amongst the most able members of the Colleges of Physicians and Surgeons, if wholly unconnected with any medical pupil-rearing establishment. Selecting one from each corporation would be an equitable arrangement. For instance, any two of such eminent persons as Sir H. Holland, Dr. Latham, Dr. Watson, Dr. Copland, Sir B. Brodie, Mr. Guthrie, Mr. Arnott, and others I might name, would prove not only unexceptionable, but devoid of all bias or suspicion in reference to particular schools; and, further, would impart to the new board high professional reputation, besides great scientific attainments. I trust you will, in a future number, enlighten those who, like myself, are at present ignorant how this precious affair was managed, and thereby hold up to fame the individuals secretly pulling the wires on that occasion. They must then become known to posterity, even in deeds of darkness. The profession and the public cannot but feel much obliged by your directing attention to this subject—*as in*

portant to the Indian service—seeing that it adds another claim to the many you have already acquired to our sincere gratitude for advocating through a long career the real interests of medical men, and the cause of independence.

September, 1894.

I am, Sir, yours, &c.,

CHIRURGUS.

## THE CHOLERA.

In the opinions of medical men were canvassed, we think most (though we are sure not all) practitioners would be found expressing their belief in the following series of propositions:—

- A. The more marked kind and greater amount of evidence we possess, tend to support the doctrine that in cholera there is the reception into the body of a *specific poison*—the cholera poison—either by the skin, bronchio-pulmonary membrane, or gastro-intestinal surface.
- B. That the disease called cholera is a *specific affection* produced by this *poison*, and characterized chiefly by the following (amongst other) symptoms, or at any rate is only *unmistakably* known to be cholera when evincing them all, or by far the majority of them,—viz., intense depression of the great ganglionic nervous centres in the abdomen, extreme exhaustion of the vital powers, and in particular of the capillary circulation, with ice-cold tongue, and husky voice; copious serous discharge from the gastro-intestinal surface, “its normal action being reversed to a fatal exosmosis,” (Gull,) the lesions of the mucous membrane thus affected being of a passive character. Intellectual manifestations little or not at all affected.
- C. That the fatality of the disease exhibiting these characteristics (B) is extreme, from 60 to 70 per cent., if not more, of those attacked sinking beneath it.

We believe the following propositions would be equally acquiesced in:—

- D. That (we find some difficulty in wording this one) in by far the majority of cases (in this country at least) the first symptoms, or the precursory signs, or the initiatory phenomena, or the usual prodromata, are chiefly evidenced in a diarrhoea and its attendant discomforts.
- E. That this diarrhoea, &c., are, in the majority of cases, easily amenable to treatment, if they come under it early, and as easily advanced to the characteristics B if neglected.
- F. That this initiatory diarrhoea, or the diarrhoea proceeding and advanceable to B, presents no characteristics by which it can be distinguished from other diarrhoeas; and that it is not until the nervous system begins to be depressed, and the feculent character of the stools is lessened or lost, and they become alkaline, watery, and flocculent, that it can be said to be distinctive, (Gull.)

Now, to such as may hold these opinions we do not think it an unreasonable request to ask of them some sort of solution of the following difficulties:—

First, if A and B be true,—i. e., if cholera is a specific disorder, possessing “an individuality which forbids our merging it for the present in any general category,” (College Report, part 2,) how does it happen that we are able to put a stop so satisfactorily to its first stage or prodromata, since there is no analogy that we are aware of to be found in relation to any other specific or special affection?

Secondly, if E and F be true,—i. e., if the initiatory diarrhoea be so readily amenable to treatment, and if it offer no differential signs to mark its specificity or choleraic relations, how is it known that such diarrhoea would pass on to choleraic disorder, B, if left alone untreated? It is strange that a morbid condition, clearly defined, and leaving no doubt as to its existence, should so baffle every possible kind and description of therapeutics, that it is very doubtful indeed if in those cases, where a fatal result does not ensue, art has had the least to do with it, and yet (according to all account) is so easily arrested at its onset by any of the ordinary, absorbent, aromatic, astringent, and sedative remedies. In respect to any other *specific* disorder it is quite different, though it should be remembered that when this is incurable there is no mistake about its being cholera, (not from such incurability simply, but from the presence of certain symptoms,) whilst, when so satisfactorily arrested, no one might be able to point out a single choleraic sign about it.

The initiatory *mal-aise*, the pyrexial prodromata, of the specific febrile disorders, are mostly undistinguishable at first

from those of the non-specific forms of febrile erethism, we being often obliged “to wait to see what it turns out to be,” as the saying is. Do we usually believe that where a *mal-aise* or pyrexia subside under slight treatment, we have arrested the progress of a specific disorder or febrile exanthem; or that if such febrile erethism had not been arrested it would have run on to, or exemplified the further signs of, the specific febrile disease which might at the time be epidemic or most prevalent? Or, on the other hand, should we consider that in such cases as would run on to the perfect exemplification of the specific malady, art will have much power in arresting the progress? So might it therefore be required of the author of the following observations in the last Weekly Return of the Registrar-General, to afford, under the difficulties of the question, to his less clear-sighted brethren the proper numerical determination of the premises, and the algebraic expression of the problem by which he has calculated, according to the theory of probabilities, that a man who died of the specific disease, called malignant cholera, would have had so many chances in favour of recovery, if treated early, as to render it *all probable* he would not only not have died, but have been alive “now.”

“At Salisbury Arms, Queen’s-road, Holloway, on 25th of August, a publican, aged sixty-five years, ‘diarrhoea, (two days,) cholera, (24 hours.)’ In all probability this man would have been alive now if he had called in medical advice when the premonitory diarrhoea commenced.”

It has been said that diarrhoea is attendant upon cholera as a shadow upon substance, (College Report, 2nd part;) that the diarrhoea, which is generally prevalent at the same time as cholera, is to be held in its various shades a constituent part of the cholera epidemic, (Registrar-General’s Report;) and “that the diarrhoea which prevails when cholera is epidemic is due to the same cause as cholera itself, is to be inferred, not only from its clinical history, but also from other circumstances,” (College Report, 2nd part.) If such be the case, then, why is not all denominated cholera? Why is the Registrar-General called upon to distinguish in an epidemic of cholera between this disease and the surplus cases of diarrhoea which are then asserted to occur? Is it beyond all reason to ask whether there really is more diarrhoea (independent of that accompanying B) present when cholera prevails than when it does not? That the community (for reasons quite unnecessary to point out) are attracted to slight disturbances of the kind, that they seek advice for them more frequently, and that consequently both the public and the profession’s attention are then more taken up with diarrhoea, must be freely admitted; but this is not the point at issue. If it was freely published some season when small-pox was more prevalent than ordinary, or was epidemic, “Beware of the slightest shivering, sickness, pain in the head, &c. &c., if not checked, the trouble may run on to small-pox,” we have no doubt we should hear of such an amount of febrile disorder—especially amongst the fair sex—as would be quite astonishing.

Now, in answer to these and other difficulties, we have now space to enlarge upon, we fear the present state of knowledge only permits of the following reply, but which, nevertheless, is closely related to a valuable indication of hygiene and practice—viz., it is evident that cholera, even fatal cholera, is usually seen to be preceded by diarrhoea of such a character as to present no signs by which, in the majority of cases, such diarrhoea can be distinguished from non-specific or simple kinds; and it seems equally well to be established that the safest practice is to arrest the intestinal flow as early as possible, since the sooner it comes under treatment the milder usually are the subsequent stages. It therefore follows that although it be admitted, pathologically speaking, it is quite impossible to say that all the cases of arrested diarrhoea are cases of arrested prospective cholera, yet as some of them probably or even possibly may be such, it is the most practically useful plan to treat them all accordingly. There are no characteristics which enable us to draw the necessary distinctions with any certainty as would entitle a *practical* difference to be made. “Experience,” says Dr. Gull, “has abundantly shown that during the epidemic the stages from a mild and apparently simple diarrhoea to the rice-water purging and collapse are not definable, and that the former, if not unchecked, does in numerous instances gradually pass into the latter, with its attendant collapse and fatal results.” Highly as we respect the labours of the writer we have just quoted from, we must nevertheless express our dissent to the spirit of the following quotation:—

“Although all observers admit the frequency of this precursory stage, there has been some difference of opinion and

much unfruitful discussion about its pathology, whether it be a part of the disease and due to the action of the poison, or merely a common diarrhoea, upon which the specific effects may at any moment be engrafted," "there is evidently in some minds a disinclination to regard any case as cholera unless it manifests symptoms of marked intensity."—(College Report, Second Part, p. 124).

Now we cannot think a discussion concerning the question we have mooted is *pathologically unfruitful*. Nor do we discover much to find fault with (pathologically) in that tendency to demand symptoms of marked intensity, and of a particular character, in all asserted examples of malignant cholera, seeing that it is alone their presence which unmistakably establishes the existence of the affection.

Relative to the progress of cholera in the metropolis, we condense the following from the "Weekly Return" of the Registrar-General for the week ending September 2nd:—

Districts.	Elevation above water mark.	Population (1851).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	99
Central (St. Giles, &c.)	49 "	393,256	69
Western (Kensington, &c.)	28 "	376,427	300
Eastern (Shoreditch, &c.)	26 "	485,522	149

And 243 deaths are referred to Diarrhoea.

The present cholera epidemic, like that of 1848-9, has appeared in two eruptions. The first broke out earlier (August 21st, 1853), the latter eruption later in the year (July 8th) than the corresponding eruptions in either the epidemic of 1832-3, or of 1848-9. Up to the date of September 1st, 1849, the epidemic in London during fifteen weeks destroyed 8117 lives; in the present epidemic 4070 lives have been lost in the eight weeks ending September 2nd.

Although little more than a fourth part (616,635) of the population (2,362,236) of this vast city is on the south side of the Thames, 2317 of the 4070 deaths from cholera have happened in the low southern districts. And there the mortality is still heavy; 101 persons died of cholera last week in Bermondsey.

On the north side of the Thames there has been a remarkable outbreak in the St. James's district.

A portion of the lower part of Deptford, near the dockyard, has been the scene of a terrible visitation of cholera. Forty human beings have perished in one street alone, and it was stated, in the latest information we could obtain, that there were twenty more hopeless cases lying in the same street and the adjacent courts. The immediate locality of this terrible outbreak is New-street, Wellington-street, Deptford, a long street of old houses, many of them uninhabitable or in ruins, while, with few exceptions, all those which are tenanted are in a very dilapidated state. In many places one common cess-pool supplies the wants of several houses, and the stagnant gutters upon each side of the street do the duty of sewers. Added to this, Wellington-street, out of which New-street branches, being in the same state, nearly all its refuse water runs through New-street before it find its way into the Thames. In places where houses have been pulled down, the waste ground has been used as a depot for all sorts of filth. The inhabitants are principally decent labouring people.

The streets running off on the Soho side of Oxford-street are at present suffering very greatly, as are also the districts of Clapham, Camberwell, and the Edgware-road.

The *Belfast Mercury* has the following statement on the progress of the epidemic:—"We regret to state that there is no diminution in the mortality arising from this epidemic in Belfast. The weather during these past few days having been very warm and sultry, has rather stimulated, it is said, the disease; and yesterday there was a greater number of fatal cases in this town than has taken place any day since the recent outbreak in this locality. The weather, however, is becoming cooler; and it is to be hoped that a concurrent improvement in the public health will take place. Cholera, which for nearly three weeks had disappeared from Lisburn, has again returned, and within the last two days several cases have been reported."

At Edinburgh, only one case of cholera has been reported in

the last bulletin; that proved fatal in seven hours. Fewer deaths seem to take place in Glasgow, but the reports are irregularly made. Cases still occur in Aberdeen, Montrose, Dumfries, and Alloa. Wick is stated to be the dirtiest town in Scotland.

According to the *Reporter*, the metropolitan business of all reputable Life Assurance Companies and Societies has received much impetus during the last few weeks in consequence of the prevalence of cholera. This fatal scourge silently proclaims the truth of the Scriptural admonition to the most negligent or indifferent in regard to the much neglected but important social duty of life assurance, that "in the midst of life we are in death." It does not appear, however, that more than the average number of claims accruing at this season of the year—when the metropolitan mortality is usually very high—have fallen upon the life assurance offices. This is, undoubtedly, traceable to the circumstance that "selected" lives, selected for assurance on account of health, vigour, and sobriety, are less exposed to danger from the epidemic, and that it chiefly lays low the weak, the residents of dirty neighbourhoods, and the habitually intemperate. The life offices, however, are somewhat cautious in accepting assurances on the lives of persons residing in the districts just now most afflicted with cholera.

By the *Argo*, just arrived, we learn that the cholera was raging at the Mauritius. Port Louis was almost deserted, and all business was stopped. The grand total of deaths was about 11,000. The disease had been abating for ten days before the sailing of the *Argo*.

## GENERAL BOARD OF HEALTH.

THE six inspectors who have been charged to report to the Board of Health on the arrangements made by the Metropolitan Boards of Guardians have been directed to extend their inquiries to the following subjects:—

### INQUIRIES TO BE MADE BY MEDICAL INSPECTORS.

#### 1. The extent of medical relief now existing.

- a Number of medical officers.
- b Number of day and night dispensaries.
- c Number of house to house visitors.
- d Measures for arresting diarrhoea in workhouses.
- e Copies of notices issued by guardians.
- f Hospital accommodation and houses of refuge.

#### 2. Extent of the disease.

- a Number of cholera cases.
- b Number of diarrhoea cases.
- c Deaths from either under union medical officers.

This information to be obtained for a few days back, and tabulated in one of the returns, under the heads of—

- 1. District medical officer's cases.
- 2. Dispensary cases.
- 3. Medical visitor's cases.

#### 3. Localities affected.

- a A list of those where cholera or diarrhoea chiefly prevails, and has hitherto, or recently, prevailed.
- b Visit some of the worst localities. Inspect them and the houses, converse with the people, ascertain to what extent diarrhoea prevails, and what cleansing measures, limewhiting, &c., may be required, and whether there be any inspector of nuisances to carry out these measures.
- c Examine the water supply, and ascertain whether it is taken from the river, above or below Chelsea Reach.
- d Inquire as to nuisances or noxious trades, and inspect them.

#### 4. And after inquiry to report to the General Board of Health—

- a On the particulars mentioned above.
- b On the number of additional dispensaries required.
- c On the additional medical officers required.
- d On the additional medical visitors required, stating their number.
- e Additional inspectors of nuisances, or cleansing staff, required.
- f Additional hospital accommodation, or houses of refuge, required.

The following is the list of the members of the Medical Council appointed by the President of the General Board of Health:—

1. John Ayrton Paris, M.D., F.R.S., President of the Royal College of Physicians.
2. Sir Benj. Collins Brodie, Bart., F.R.S., Sergeant Surgeon to the Queen.
3. Sir James Clark, Bart., M.D., F.R.S., Physician in Ordinary to the Queen and to Prince Albert.
4. James Alderson, M.D., F.R.S.
5. Benjamin Guy Babington, M.D., F.R.S.
6. Alexander Tweedie, M.D., F.R.S.
7. William Baly, M.D., F.R.S.
8. William Lawrence, F.R.S.
9. John Simon, F.R.S.
10. Richard Owen, F.R.S.
11. Nathaniel B. Ward, Master of the Society of Apothecaries.
12. John Bacot, Inspector of Anatomy.
13. William Farr, M.D., Registrar-General's Office.

These gentlemen, with the exception of Sir B. Brodie (who being out of town had not sent in his answer) and Mr. Green (who has stated his inability to attend, in consequence of his other avocations), met on Wednesday at the office of the General Board of Health, when the following letter was read by the President:—

"General Board of Health, Sept. 6th.

"GENTLEMEN,—In opening the first sitting of the first medical council that has allowed itself to be associated with this department, it becomes my duty, after thanking you for the public spirit and benevolence you have shown in undertaking this service to the community, to point out briefly both what appear to me to be the general objects in respect of which your assistance and advice will be useful, and the more special and immediate matters to which your attention is invited at present.

"I am charged with the responsible duty of directing the sanitary administration of the country, so far as we have as yet anything deserving the name.

"But upon scientific matters connected therewith, where the medical profession are to be consulted, advised with, laid under contribution for service or information, or called upon to act, I wish to have the aid of a medical council to whom I may submit questions for consideration, and whom I may ask to suggest or undertake inquiries as may from time to time be necessary.

"The special work of this department is the application of the Public Health Act to such towns as petition for it.

"Besides this, in times of epidemic, the Board is charged with the duty of issuing regulations and directions for the prevention, as far as possible, or mitigation of disease.

"It will be apparent that it is in connexion with the latter branch of my duties I shall have occasion for your valuable services.

"But should public confidence be acquired to this department—should the science of public health take its place amongst the matters with which statesmanship may properly concern itself, as I believe must sooner or later be the case—a wider field will be opened to this department and to the professional advisers whom it may be able to associate with it.

"The circumstances of this country, its wealth and poverty, its great cities, with their social extremes of luxury and privation, its aggregation of individuals on the same spots, its multifarious industrial occupations, all point to the duty of studying the effects on life and health of trades, callings, and processes, habitations, sites, water supply, sewerage, the adulteration of substances used for food, drink, and medicine, as matters vitally affecting the well-being of the nation.

"On many of these subjects I hope it may be in my power at future periods to avail myself of scientific aid, but at present the matter which most presses is the epidemic now unhappily prevalent in this metropolis, as well as in other parts of the united kingdom. With this my duty brings me into active and hourly contact, and I should deeply regret if (besides the work this office may be enabled to do at present in aid of local authorities, or, when necessary, in compelling the observance of the law,) I am not able to deduce, by your assistance, from this terrible visitation both facts and lessons which may hereafter be made available.

"For this end I have the cordial co-operation of the Poor-Law Board, the Registrar-General, and the Commissioners of Sewers for the metropolis, while all through the country the registration staff and the local boards of health may render me most useful service. But the most valuable result within my reach at present will be wanting unless I have your aid in procuring such information as to the concomitants and course of the epidemic as only medical and scientific observation can detect.

"Cholera is now very widely prevalent in London; up to the 2nd of September, 4070 persons have died of the disease in the metropolis alone.

"I purpose to direct inquiries into the conditions which attend the presence of the epidemic, so far as they can be gathered from meteorological, microscopical, and chemical observation.

"The gentlemen who have undertaken to conduct these inquiries are here, and will detail for your approbation what is proposed or has been done.

"But, besides this, I have caused a form to be drawn up, which I propose, with your approval, and after it has been settled by you, to have circulated amongst all the qualified medical practitioners in London, with a view to determine the number of cases of choleraic disease, the proportion of deaths and recoveries, and the treatment pursued in each case.

"The settlement of this return is the immediate object of this meeting of the council.

"I wish, also, that Dr. Sutherland should state to you what has been done in the way of providing for superintendence of the execution by local authorities of the directions and regulations of the Board, and I shall be as much obliged if you would aid me by any suggestion as to other means for this purpose that you may think desirable to be taken.

"I have also directed to be laid before you copies of the handbills issued by the Board, giving plain advice adapted to the emergency. Any suggestions as to these I shall be thankful for, as, indeed, for everything that may briefly and clearly inform the public mind, and, while promoting calmness and confidence in the means of prevention, indicate these means, in the way best adapted to popular apprehension.

"I have the honour to be, gentlemen,

"Your most obedient servant,

"B. HALL."

The council considered the proposed form of return referred to in that letter, and agreed to a circular to be sent with the form to all qualified medical practitioners in the metropolis.

Certain propositions were brought forward, and the meeting then adjourned.

Intelligence having been received of a violent outbreak of cholera at Wisbech, Dr. Milroy was ordered to proceed instantly to that town.

## THE WAR.

(FROM A CORRESPONDENT.)

THE BALTIC—LEDSUND, AUGUST 29TH, 1854.

AFTER the surrender of Bomarsund, I visited the different fortifications, and had a good opportunity of inspecting the arrangements the Russians had made for their sick and wounded. As regards comfort and accommodation, everything appeared to have been well-regulated and managed. There were two large hospitals outside, and in every fort, sick wards and dispensaries. As a general rule, they were better ventilated, and looked cleaner than the other buildings, and consequently less impregnated with that peculiar sickly odour so characteristic of Russians and Russian dwellings.

To the rear of the large fort, near the church, was a large and commodious hospital. Attached to it were bath-rooms, a dispensary and laboratory, fitted with every convenience and apparatus, and well stored with drugs. The quality of these latter articles was not of the highest. I saw amongst them the most popular medicines, with the exception of quinine and iodide of potassium, which either they do not keep or I could not find; "quassia" was their only vegetable tonic; "mercury" in nearly every preparation was abundant; and I discovered some collodion and hydrocyanic acid, which I judged from the labels to have come from Stockholm. I was very much surprised to find in various parts of the forts bottles of chloroform, which appeared to have been lately used; they were generally in those quarters where our shell and shot had done the most damage. I heard afterwards, from one of their medical men, that they perform every operation with chloroform, no matter how trivial it might be. Attached to the main hospital were the surgeons' quarters. The library was large, and well stored with books in the Russian, German, and Latin languages. I saw several translations of English and French authors, of Sir A. Cooper, John Hunter, Dumas, &c. Unfortunately, the night previous to my visit, the soldiers had been allowed to pillage and plunder, and in consequence every place was in the greatest confusion. The hospital and surgeons' quarters had not escaped the general ruin. Whatever was

valuable had been taken away; every box and drawer had been forced open in search of booty, and the contents thrown on the floor. Instruments, drawings, books, preparations, &c., were scattered about in endless confusion, torn and trampled upon. The French surgeons saved several cases of instruments from being destroyed or stolen. I was kindly permitted to see them. The instruments were rough and old-fashioned compared with ours, and lack also that finish and nicety of weight. Their knives are all curved, ill-shaped, and very much out of order. A cupping case, of Paris manufacture, was the only thing I saw at all modern.

I cannot speak of the state of medical knowledge in Russia. I was told by one of the medical staff that in cases of wounds of the extremities, anyway severe, amputation is always performed; excision of joints, or attempts by treatment to save a wounded limb, are things quite unknown. I saw some cases of amputation which had been performed about two months previous; they were men that had been wounded when the *Hecle* and *Valorous* had bombarded the place. The stumps had cicatrized, and were going on well. The circular operation is always performed, and generally amputation is always primary. The Russians certainly are the most patient under suffering of any people I have ever seen; they bore their wounds and subsequent operations with the greatest courage and stoicism, never uttering a complaint or a groan. The wounded have been all conveyed on board the hospital ships.

The cholera, I am sorry to say, has broken out in an alarming manner amongst the French troops. Since the surrender of Bomarsund nearly 500 men have perished, almost every case having proved fatal. A large body of the army left Bomarsund in consequence, and encamped on the *Praesto* Island. All our marines have been sent on board their respective ships; one belonging to the *Blenheim*, and doing duty on shore, was attacked with cholera, and died in four hours. It is the true Asiatic cholera, characterized by all the usual symptoms, and proving fatal in about twenty-four to thirty-six hours. We are perfectly at a loss to account for the appearance of this epidemic. I have not heard of any of the inhabitants of the island or any of the Russian soldiers having suffered from it. The French troops were all men accustomed to active service, the greater number of them, I believe, having served in Algiers. The weather was remarkably fine and dry during the whole of the siege. For the first few days they were on shore no cases occurred, but since the 16th, however, it has increased greatly. The water obtained on the island has a peculiar odour, and a disagreeable limy and ammoniacal taste. I should like very much to have the water of the various parts of the Baltic properly analyzed; possibly by so doing some light might be thrown on the cause of this malady, that has been to the allies more destructive than all the machinations of the Russians.

In the fleet, I am happy to say, that the cholera is on the decline, though an aggravated form of diarrhoea is still very prevalent. The *Hannibal* has buried several men since her arrival at Ledsund, and when she left for England she had upwards of 120 sick on board. The *Majestic* has also an immense sick-list, and has lost many of her crew. The *Austerlitz*, since her arrival in the Baltic, has buried upwards of 100, principally of cholera and fever.

In the beginning of last week the weather was much colder, with strong westerly winds and occasional rain. Within the last few days, however, the weather has become much warmer and fine. Fresh meat is liberally supplied to the men. Once or twice a week, a steamer full of bullocks comes from Dantzic. In a few days the fleet are going to sea.

#### ARMY IN THE EAST.

(FROM ANOTHER CORRESPONDENT.)

LIGHT DIVISION, CAMP NEAR PREVADY, BULGARIA,  
AUGUST 18TH, 1864.

I TOOK a medical survey of the Light Division, yesterday, and there have been only five or six fresh cases of cholera during the last three days. Some of the regiments just now are exempt from the disease, but fevers and dysentery are becoming more prevalent. The cholera first appeared in the Light Division encampment, at Devna, on the morning of the 23rd of July: two fatal cases occurred in the 23rd, and four in the 88th Regiments. On that and the following day the disease extended to the other regiments composing the Light Division—viz., the 7th, 19th, 33rd, 77th, and the Rifle Brigade; and up to the present date (August 18th) the mortality has been 165 men, five officers, and six women, including, amongst the officers, Assistant-Surgeon Jenkin, of the 23rd Regiment.

Many of the orderlies were attacked, and died, and several of the medical officers have had choleraic diarrhoea. Before the outbreak in the Light Division, cholera was raging in Varna, carrying off daily between forty and sixty of the French encamped in its vicinity; and several deaths occurred in the small number of English quartered there.

Before the disease appeared in Devna, we had a great deal of diarrhoea in the encampment of a suspicious character. On the 24th of July, the Light Division moved five miles farther, and encamped between the villages of Monastire and Prevady. This change had a beneficial effect, as for two days afterwards very few fresh cases occurred; but subsequently it again appeared in a severe form in the 7th, 23rd, 33rd, and 88th Regiments. The troops were shortly again permitted to shift to new ground, and they continue to do so every ten or fourteen days. The change is always attended with marked improvement, and now each regiment is separate, and we are not crammed into a confined space, as at Devna.

Although we have just now but few cases of cholera in the division, still diarrhoea is very prevalent, and fevers and dysentery are daily becoming more so.

I am sorry to say that there is scarcely a medical officer in charge of a regiment that has the proper medicines to treat the above diseases. Day after day requisitions for medicines are sent in by medical officers of regiments, without any effect; so, unless the surgeons can check the premonitory symptoms of cholera, the hour of counteracting the disease is lost, and the result you can guess.

We—I allude to all the regimental surgeons—cannot get a single preparation of opium—viz., there is no powdered opium, no tincture of opium, no extract, scarcely any preparation we require; yet there are plenty of the above medicines in Varna, but I believe no way of sending them out, owing to deficient commissariat arrangement, or some mismanagement in our own department.

Another deficiency, more annoying than important, is, that many of the surgeons are unable to get a single candle from the commissariat, who ought certainly to have an abundant supply; but during the last week we have been without candles, and were it not for the different officers kindly giving up their own private supply, many of the regiment marquee or hospital tents would be in total darkness during the night.

Another flagrant abuse is to be found in the purveyor's department. The worthy in charge appears to be above his business, and as he is entrusted with the medical comforts—viz., wine, arrowroot, sago, brandy, &c., we have to make out requisitions in duplicate for each, and give two receipts, when we require any of the above articles, although we have often to despatch our messengers a considerable distance; yet this gentleman will send them back under the most frivolous excuse, if the requisitions and receipts are not in the proper form. Major D—, of the Light Division, at present suffering from dysentery, was ordered port wine by his medical attendant: none could be procured in any of the canteens, nor at Varna. The medical officer in charge of the regiment made a requisition for a bottle of port wine on the purveyor; but he refused to give it, simply because it was for an officer. This was reported to me yesterday, and I have no doubt of it being a fact.

There are many other difficulties thrown in the way of medical officers. For instance: according to the orders of the Director-General at Varna, the medical officer must enter every half-ounce of sugar, arrowroot, &c., which he orders for a sick man, in the register of the case, thus occupying in useless writing the time that should be spent at the sick man's bed.

There are not enough medical officers with the army; half the young hands sent out fall sick a week or so after their arrival. The surgeons of regiments are engaged in keeping their hospital accounts, and the senior assistant-surgeons, with a junior, do all the work, or the greater share. I myself have often been engaged, since the outbreak of cholera, from five o'clock A.M. until nine o'clock P.M., and afterwards called up five or six times during the night. During the prevalence of yellow fever in another hemisphere, I worked harder, and did not feel the fatigue so much as I now do: this I attribute to the climate.

There is not a second-class staff-surgeon with the Light Division, and only two of the first-class. I consider that a medical officer should be constantly in the hospital tent, as the orderlies always require looking after, and good nursing is the best treatment which I am acquainted with.

I am satisfied that Dr. Smith, the Director-General at home, would do his best to have many of the above abuses corrected, were he acquainted with them; but the other authorities must lend a hand, instead of throwing difficulties in the way.

Sir George Brown inspected the Light Division yesterday. He is a fine, active officer, and rode out from Varna, and returned again in the afternoon. The men to-day are full of high spirits and merriment, in hopes that we are going to move to Varna, and embark for Sebastopol.

The camp life is harassing, and when the men are dying from disease, without excitement, they become low-spirited. As there are, however, rumours afloat about moving, they are quite jolly. I have heard that the 4th Dragoon Guards have lost thirty men, and also Surgeon Pitcairn. This was the correct list of the mortality in that regiment two days ago.

The fever now prevalent in the division is of a low, continued type, and very amenable to treatment. It commences with a feeling of undefinable discomfort and oppression, preceded by loss of appetite, or I should rather say, with a distaste for the *rations*. Many of the men live entirely, in this stage, on their biscuit, or bread and coffee. The bread is often of very bad quality, and under-baked; and the ration of meat is so poor, that the men often throw it away. They do not report themselves ill until obliged to do so, as many of them dislike coming in this state to the hospital tent, where they come in contact with the cholera cases.

I find that change of diet—viz., chicken broth, roast lamb, and a dose of quinine, generally sets a man all right; and the captain commanding the company pays for these little luxuries, or perhaps myself, and not the Government. The latter supplies only the quinine.

If the disease is not arrested, the above symptoms are succeeded by derangement of the nervous centres, and the muscular strength is greatly depressed. There is now irritability of stomach, a sense of oppression in the epigastrium, usually some headache, the cerebral functions become sluggish, and the patient is abstracted. His exhaustion increases daily, though there are exacerbations, but no regular intermissions. Quinine, stimulants, and tonics, an occasional alterative, counter-irritants over the epigastrium, and sedatives, have generally succeeded, with change of diet, in bringing about a favourable termination.

#### [FROM ANOTHER CORRESPONDENT.]

CAMP GWELCKER, AUGUST 13TH, 1854.

I SHALL NOW attempt to keep my promise, and send you a letter by the post which leaves here to-morrow, though we are now so hard-worked that there is hardly time for anything, and one of the assistant-surgeons has gone down to the sea, having had a bad attack of dysentery. Cholera has become quite epidemic, and we seldom see it till the men are in a state of complete collapse, and quite blue, so that treatment has not done much: we have lost ten in the last twenty-four hours, and perhaps twenty-six in all; this, together with fever, has carried off thirty-three men; the whole battalion are very sickly, I may say, the whole brigade, with the exception of the 42nd Highlanders. (I wish our men had the kilt to march in in this country.) Lieut.-Col. Elliott, of the 79th, was buried this morning, and there have been several officers invalidated. At present we are all in a state of anxiety, Lieut.-Col. Tierney having gone out for a ride yesterday at 11 A.M., and while I write his horse has just been brought in, uninjured, but no news of him. Lord F. Paulett, while out riding the other day, was shot at. The country here is very beautiful, though uncultivated to a great extent, former vineyards having been allowed to go to ruin; we are about eight miles from Varna, having left Aladyn ten days ago, and we leave here on Tuesday or Wednesday next. There is a great talk about Sebastopol, but I do not believe there will be a single shot fired this year, but that we shall merely go and encamp nearer the sea, and next month go into winter quarters. I have had a month under canvas, and on the whole fine weather, with three very smart thunder storms, which are not pleasant, more especially as during one I had to get up in my night-shirt to let go my tent-ropes. Varna is the most beastly, dirty place you can possibly conceive—nasty, narrow, dirty, muddy, stinking streets. Some Greeks three nights ago tried to set fire to the French and English commissariat stores, and did some damage. Three of them were caught and killed on the spot. We have very fair dinners, but to do so we have to forage the villages, &c. Ale is 2s., port 6s., bacon, 2s. 6d., and tea 6s. 6d. a pound, and other things in proportion. B— and L— kept pretty well. Blenkins has been sent home invalidated, and already on his way home. The French have returned from the Dobrudscha, with the loss of 5000 men from cholera, &c., the Russians having poisoned the wells by throwing down their dead. An interpreter was shot at going into Varna the other

night—three shots. Cholera has broken out amongst the fleet. We had a very pleasant passage out here, which I enjoyed much, as I was not at all sea-sick, though I cannot say the same for B—. The old *Vulcan* broke down twice, once when we had the *Leander* in tow. We got on shore, and dined at Malta, which was rather a treat after being on ship-board for two weeks; and again we got on shore at Constantinople for three hours. It certainly is a most beautiful place in the distance, but when once in it you very soon get enough of the narrow, high, and ill-paved streets; but as it rained most of the time we may like it better on our return. After this we did not leave the ship till we reached Varna. The most unpleasant part of our voyage was across the Black Sea, cold and bleak, with a strong head-wind, and the small coal from the *Vulcan's* short funnel in our eyes. I could write you a much more detailed account, but have not time in the present state of the health of our men, as it takes some little time, blown about as we are by a strong wind to-day.

#### ROYAL POLYTECHNIC INSTITUTION.

THIS entertaining place of amusement has recently undergone a complete remodelling as to its arrangements. Mr. Pepper, the chemist, and one of the lecturers, has been appointed resident manager, and under his direction there seems likely to be an addition to the spirit in providing entertainment for the public which has always characterized the institution.

There has lately been added to the subjects of interest one which cannot fail to prove a source of much gratification to the numerous visitors, from the brilliancy of the experiments it admits of, and the instruction it affords. This is the apparatus of M. Duboscq for demonstrating the polarization of light. The object is accomplished by the aid of electric light; and it appears that certain interesting results have been obtained in the decomposition of light, and in the separation of its component rays according as the electrodes of the light-producing battery consist of different substances.

One most remarkable experiment with the apparatus has been termed the electric fountain. A stream of water issues from an opening in a cylinder, through which a ray of light is made to pass. The light appears as if retained by the water, and carried along with it as it falls in a sharp curve downwards, and, being received into a vase below, looks like molten metal. The colour of the light is altered by the interposition of pieces of coloured glass, by which also the beautiful effect is greatly enhanced.

Carrying out the purpose of conveying information and knowledge to all classes of the public, a school of instruction has been established, in which courses of lectures on mechanics and other art-study will be given for the benefit of the working classes, admission to which is to be obtained by tickets issued at half the usual charge, the guarantee of their being *bona fide* working people being by certificate from the employer or the foreman of the place of business at which they are occupied. So meritorious an undertaking deserves to be successful, and we doubt not the directors of the Polytechnic will derive benefit from their liberality.

#### Medical News.

APOTHECARIES' HALL.—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, August 31st, 1854.

BROWNE, CHARLES, Camberwell.  
GAGGS, CHRISTOPHER, Howden, Yorkshire.  
HITCHINS, CHARLES VERNON, Tiverton, Bath.  
LEWIS, WILLIAM JARRETT, Carmarthen.  
RAY, JAMES, Lincoln.  
SYMMONS, GEORGE STRATTEN, Witham.  
WEST, JAMES FITZJAMES.  
WOODD, HENRY TURNOR, Bromley, Kent.

MARYLEBONE COUNTY COURT, SEPTEMBER 4TH.—IMPORTANT TO EXECUTORS AND MEDICAL MEN: SURGEONS' LIABILITIES FOR INSTRUMENTS.—CLARK v. BLUETT.—This action, which was tried before J. L. Adolphus, Esq., and brought to recover the sum of £5 10s. 6d., contains features of more than ordinary *£ s. d.* character, and is very important to

the medical profession and to executors. The plaintiff is a surgical instrument-maker, and the defendant is a surgeon. Mr. George Sleene, the solicitor, of 3, Cumberland-place, New-road, appeared for Mr. Clark; and Mr. Vaughan, the County Court solicitor, for the defendant.

The plaintiff stated that he had supplied surgical instruments, catheters, &c., to a patient of Dr. Bluett—viz., Sir Frederick Watson, now deceased. These instruments were ordered by the defendant, and used by him. He had, previous to the sale of the goods, value now sued for, supplied Sir Frederick Watson with other surgical instruments, and which were paid for on delivery by Sir Frederick. When Dr. Bluett ordered the instruments, he did not say that witness was to look to Sir F. Watson for payment. Upon applying to the defendant for payment, he said he was not liable, but that he (plaintiff) must look to the executors for his account. Upon his applying to the executors of defendant's patient, they repudiated the claim, and referred him to the doctor, at the same time informing witness that they had paid the defendant a bill of £300, and that the instruments he supplied were charged for in this heavy bill. He never received the order from Sir F. Watson.

By Mr. Vaughan.—Instructed his solicitor to write to Dr. Bluett for the names of the executors, and had made out a bill against them. Believes the instruments were partly fetched by Sir F. Watson's servants, and the remainder were delivered at Sir F. Watson's house. None were left at the defendant's house. The charge for the instruments is the same as though a medical man had paid for them.

Mr. Vaughan observed, that if medical men were held liable for extraneous articles furnished to their patients, like the present, it would be a monstrous injustice. It was true the goods supplied were surgicals, but if the medical man was to be answerable for dead patients' goods, it would be reasonable to suppose that he would supply all things appertaining to his profession direct to the patient, and charge for them in his bill to the patient's executors. His client had not charged for these instruments. He knew nothing about them, further than calling upon the instrument-maker to direct him as to the size and nature of the instruments to be furnished the patient. He called Dr. Bluett, who positively denied giving the order for the instruments, further than instructing the plaintiff what would be required. He had offered to give evidence to make the executors liable. Previous to Sir Frederick Watson's death, the whole of the management of his patient's household was in his (defendant's) control. Sir Frederick's valet knew what was required, and sent to plaintiff or other surgical instrument-makers for the instruments. The injuries his patient laboured under required three of these instruments a day, and he had supplied all his stock, and told the patient's servants where they could purchase others.

By Mr. Sleene.—Sir Benjamin Brodie used some of plaintiff's instruments; the others were applied by witness. Had he (defendant) supplied the instruments, he should have had 25 per cent. discount off plaintiff's bill.

A late servant of Sir Frederick Watson proved to fetching the instruments by order of Sir F. Watson.

The learned judge was of opinion that the defendant was liable, although he admitted it was a difficult case to determine. Verdict for the plaintiff, with costs.

**THE NEW CORONERSHIP AT BRIGHTON.**—An active canvas is now being carried on at the new borough of Brighton for the office of coroner. A member of the legal profession and one of the medical are striving for the appointment. The medical candidate is Mr. Rugg, a gentleman well-qualified for the post, of high respectability and extensive practice, and long resident at Brighton. His medical brethren are zealously exerting themselves in his favour, and we sincerely wish him success, as it is unquestionable that this office is more likely to be efficiently filled by a member of our own profession than by one of the law.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, SEPTEMBER 2ND.**—In the week that ended on Saturday last, 2515 persons died in London. This number exceeds the average (1248) by 1267, but is 281 less than the number of deaths in the week that ended September 1st, 1849, when cholera was epidemic, and 2796 persons died. The air was stagnant in the early part of the week; no rain fell; the sun shone brightly; and the temperature of the atmosphere and the Thames ranged from 60° to 70°. 1287 deaths are referred to cholera, 243 to diarrhoea. The deaths from cholera during the last nine weeks have been 1, 5, 26, 133, 399, 644, 729, 847, 1287.

## Obituary.

**DEATH OF MR. EBENEZER ALFRED JENKIN, LATE OF SWANSEA.**—It is with much regret that we have to announce the death of Mr. EBENEZER ALFRED JENKIN, senior assistant-surgeon of the 23rd Royal Welsh Fusiliers, aged thirty-seven. The following is an extract from a letter of an officer of the Light Division in Turkey:—"Mr. Jenkin was left behind at Devna, in charge of some of the soldiers who were too ill to be moved when we came to Monastère. Poor fellow! he followed us here, but very unwell from diarrhoea and great debility, and sank a few days afterwards." The Director-General of the Army and Ordnance Medical Department, writes:—"Mr. Jenkin was attacked on the 29th of July, and died on the 2nd of August. He was a fine young man; and, besides the loss his friends have sustained, the army has lost a good and zealous medical officer." Mr. Jenkin, during his service in the army in foreign parts, had been eminently successful in the treatment of yellow fever in Jamaica, and of cholera at Malta and the Ionian Isles. The late Commander-in-Chief, the Duke of Wellington, communicated his thanks to Mr. Jenkin, with three other medical officers, for his zeal in attending to the soldiers at Malta, in 1850, when attacked with the disease. He was ever the first to meet danger when duty called him, and the last to withdraw from it. It is a melancholy satisfaction to his friends to know that Mr. Jenkin has fallen a victim whilst zealously endeavouring to mitigate the sufferings of our noble soldiers who have gone into a foreign land to vindicate the honour of the British name.

On Tuesday, the 2nd ultimo, at his residence, Hounslow, DAVID THOMAS MORRIS, Esq., M.R.C.S.E. and L.S.A., 1851, Fellow of the Medical Society of London, in the 29th year of his age. The deceased gentleman was a young man of considerable promise, and had been, for three years previous to his death, the principal visiting assistant to Messrs. Frogley and Hall, of Hounslow. His position and circumstances had for a long time preyed heavily upon his mind, and in consequence of some unpleasantness transpiring between him and his employers, he took a large quantity of prussic acid from a phial, and drank it in the presence of his wife. His death was almost instantaneous. He was very popular in Hounslow, and his death quite cast a gloom over the town.

On the 31st ultimo, at his residence, Greenwich, JOHN GRIFFITH WILLIAMS, Esq., R.N., second son of the late William Williams, Esq., of Cefn-y-Cwmawd, of Anglesea, Wales. The deceased gentleman was a full naval surgeon by seniority, under date of July 20th, 1838.

On the 2nd inst., at his residence, 4, Berwick-street, Soho, CHARLES HARRISON, Esq., Surgeon.

On the 3rd inst., at Reigate, Surrey, GEORGE DRUMMOND, Esq., Surgeon, of Regency-square, Brighton. The deceased gentleman was a member of the Provincial Medical and Surgical Association, M.R.C.S.E. 1832, L.S.A. 1831.

On the 25th inst., at No. 7, Darnaway-street, Edinburgh, DANDISON COATES BELL, Esq., M.D., Inspector-General of Hospitals in the Hon. East India Company's Civil Service, aged sixty-one years.

On the 23rd ult., at Forston, near Dorchester, JAMES HAROLD BLAIR SANDON, Esq., Surgeon, Medical Superintendent of the Dorset County Lunatic Asylum.

On the 30th ult., at Dottingham, near Hull, at the house of his friend, S. Watson, Esq., J. ELLERTON STOKES, Esq., M.D., F.L.S., Bombay Medical Service.

On the 31st ult., at his residence, 15, Avenue Marbœuf, Champs Elysées, Paris, of Cholera, PHILIP BARKER WEBB, Esq., of Milford House, in the county of Surrey, in the sixty-second year of his age. The death of Mr. Webb will be felt as a great loss to the scientific world, to which he was well known as the author of several valuable botanical works.

On the 3rd inst., at 24, Grove-end-road, St. John's Wood, ROBERT PYLER, Esq., M.D., late of the Royal Irish Dragoon Guards, in the eighty-fifth year of his age.

ROBERT MACFARLANE, Esq., Surgeon, of Ryers Green, Bishop's Auckland, Durham, through an accident, on Sunday, the 3rd inst., at a village called Spennymoor, in the above locality. The deceased gentleman was thrown from his gig on the previous evening whilst returning home at a late hour from visiting his patients. He was very much beloved on account of his devotion to his patients in the discharge of his professional duties. Immediately after the accident he was conveyed into a house adjoining the spot, and medical aid instantly procured, but he had received injuries of so serious a nature as to

preclude all hope of recovery. He gradually sank, and expired on the Sunday afternoon. Mr. Macfarlane was medical officer of the Auckland Union, and a Member of the Provincial Medical and Surgical Association.

**M. Louis, Jun.**—A domestic calamity of a very distressing kind has just cast a gloom on the family of the celebrated M. Louis, so well known by his work "On Phthisis." His son, a young man about twenty years of age, has just died of this very disease, to the great grief of his father, who had the heart-rending conviction that the patient was destroyed by an affection beyond the reach of our art.

#### TERMS FOR ADVERTISING.

The following is the Scale of Charges for Advertisements:—

For 7 lines and under.....	£0 4 6	For half a page .....	£2 12 0
For every additional line ...	0 0 6	For a page .....	5 0 0

Advertisements which are intended to appear in *THE LANCET* of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of *THE LANCET* far exceeds that of any other Medical Journal in the world.

#### TERMS OF SUBSCRIPTION TO "THE LANCET."

One Year .....	£1 14 8
Six Months.....	0 17 4
Three Months .....	0 8 8

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, THE LANCET Office, 423, Strand, London, and made payable to him at the Strand Post Office.

### The BRITISH MEDICAL DIRECTORY for 1855.

FORMS of Returns for this Directory are issued with the current number of *THE LANCET*, and the Editors particularly and earnestly request that they will receive immediate attention. The BRITISH MEDICAL DIRECTORY, by its treatment of the quacks and other irregular practitioners, has already rendered a vast service to the profession; and from its admirable arrangement, and the care with which it has been compiled, it has now become the authoritative work of reference in all Courts of Law, Public Institutions, Club Houses, Circulating Libraries, and at the chief Hotels in the kingdom. Although beautifully "got up," it is sold at *half the price* of the other Medical Directories.

In order to avoid omissions and inaccuracies, the "Returns" should be made forthwith.

#### TO CORRESPONDENTS.

The Students' Number of *THE LANCET* will be published on Saturday next, the 16th instant. Prospectuses of Schools, Hospitals, and other Institutions, intended for insertion, should be forwarded immediately to the Office, 423, Strand.

The Editors of the BRITISH MEDICAL DIRECTORY regret that Mr. J. E. should have taken the trouble to apologise for the omission of not stamping his return, as they are quite sure it was owing to some accidental circumstance. The Editors have been under the necessity of requesting that the returns should be sent post-free, in consequence of the very low price at which this Directory is charged, the cost being only half that of the other Directories. The tax of postage, if falling entirely upon the Editors, would amount to a very considerable sum.

**Dr. Robert Fowler.**—To both questions, Yes.

**Dr. Layman.**—Both the remedies referred to in the communication have received attention at our hands, and have been noticed at some length in *THE LANCET*.

**Dr. Wardell.**—Attention has been paid to the request made.

**W. F., Surgeon.**—The attendance on midwifery cases by an unqualified person has not been decided as an infringement of the Apothecaries' Act. We know of no other law which such practice could infringe.

Tax paper on Cholera, by Dr. David Lewis, will be inserted in an early number.

**J. S., (Birmingham).**—1. Dr. Power, Exeter Hall.—2. With the qualifications named, most likely not.—3. If the person pretends to be a qualified practitioner, and is not, such an appellation applied to him might be successfully justified by the defendant in the event of an action for libel being brought.—4 and 5. We think he could; but upon the point mooted in these questions we shall have more to say on an early occasion.—6. It might be of advantage.

**J. S.**—Under such circumstances, it would be by far the wiser course to take counsel of the usual medical attendant of the affected person.

**Mr. Crummay** is thanked for his communication, which, if possible, shall be inserted.

**Parents.**—1. A certificate of having served five years in "the manner of an apprentice" with a qualified practitioner, or practitioners, is, under some circumstances, received in lieu of indentures of apprenticeship by the authorities at Apothecaries' Hall.—2. The time is the easier examination, and the possession of the diploma alone qualifies for many branches of the public services.—3. Optional.

**Bristolensis.**—Beyond what is stated by our correspondent, we know nothing of the parties named.

**G. C. L.** is thanked for the transmission of Mr. Hitchman's letter.

**A Country M.R.C.V.S.**—We have not yet received the *new edition* referred to. When it arrives, it shall have a fair and candid judgment.

**Dr. Panelli's** case shall be inserted.

#### A SUGGESTION IN CHOLERA.

To the Editor of *THE LANCET*.

SIR.—However absurd suggestions may appear, and the interference of meddlers prove obnoxious to their more learned brethren, still the old fable of the feeble mouse setting free the lion suggests an excuse for a great many apparent follies. We read of the simple, bland albumen, the white of eggs, combating, subduing, and rendering innocuous the deadly bichloride of mercury, or, as its name fully conveys its meaning, *corrodes* sublimato.

Has ever an idea suggested itself that the same bland, mild fluid might possibly mitigate, if not arrest, the vomiting, if not other symptoms, which attend the ravages of that equally deadly, though in one sense immaterial, poison called cholera, which in its effects is somewhat (I believe) similar to those produced by arsenic?

Pray excuse the intrusion of

August, 1854.

DELZA.

**Medicus, (Huddersfield).**—We have seen the decision of Mr. Walker; but are still of opinion that Mr. Wilkinson is *legally* entitled to a verdict. We shall shortly refer to the subject, and show the grounds for our opinion.

**One who was Present.**—We have not seen the advertisement mentioned. After the disclosures which took place at the inquest on the body of Alfred Richardson, anything that Mr. Gay may say or do cannot be of importance to any one. It is perfectly well known that he was never asked by the Hospital Committee to return to his office, as it is equally well known that he fully deserves the position he now occupies.

**Medicus.**—The alteration will be made in the next volume of the BRITISH MEDICAL DIRECTORY. It is of great importance, with a view to the accuracy of the work, that the returns should be made immediately; and considering the exceedingly low price at which the BRITISH MEDICAL DIRECTORY is charged to the profession, the Editors undoubtedly have a right to expect that the returns will be sent back to them post-free. It is real economy on the part of the medical profession to afford to the BRITISH MEDICAL DIRECTORY every possible support.

**Mr. Edwin Lovering.**—In this climate we should give the preference to meat.

To the Editor of *THE LANCET*.

SIR.—Having been questioned by more than one, Who it was that used and recommended dilute sulphuric acid in the treatment of cholera in 1832, and alluded to in my paper? I sought for, and have at length found, that it was Mr. George Bodington, of Sutton Coldfield, whose communication will be found in *THE LANCET* for October 1st, 1853, page 323.

Mr. Bodington, it appears, published a "Treatise on the Treatment of Asiatic Cholera by Sulphuric Acid," in 1833 or 1835.

I have the honour to be, Sir, your obedient servant,

Berners-street, September, 1854.

J. H. TUCKER.

**ERRATUM.**—In the past-list of the fellows of the Royal College of Surgeons of last week, for Richard Byther Steer Bowker, read Richard Ryther Steer Bowker.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. R. D. Thomson; Dr. J. Hall Davis; Mr. J. Brown; Mr. Atkinson; Mr. Meinig; Dr. MacLoughlin; W. E., (Edinburgh); Dr. Steggall; Mr. W. B. Musket; Mr. D. Dalrymple; Mr. J. H. Tucker; King's College; University of London; Mr. A. B. Smith; Dr. J. M. Walker; Dr. H. Smith; Secretary of Charing-cross Hospital; Mr. Loggins; Mr. Wm. Walker; Mr. E. Edwards; Dr. Shortness; Mr. A. G. Smith; F. S.; Messrs. Phillips and Co.; A. Legman; Dr. R. Fowler; G. C. L.; Dr. Stark; Mr. Dalton, (Cheltenham); Mr. H. Marsh, (St. Ives); Chatham-street School of Medicine; Mr. L. F. Crummay; Mr. Lukyn; D. M.; A Country M.R.C.V.S.; Mr. W. G. Grady; Registrar of the Royal College of Physicians; C. S.; Dr. Pursell; Mr. R. T. Jopling; Dr. John Scott; Dr. Winn; Dr. Wardell; Mr. C. P. Matthews, (Grantham, Lincolnshire); Mr. P. W. Govett, (Spithhead); Mr. J. C. Richardson, (Galway); Mr. J. Graham, (Girvan, with enclosure); Messrs. Woodhead and Worsnop, (Bradford); Mr. E. T. Payne, (Bath); Mr. L. R. Cooke, (Lower Tooting); Mr. C. J. Roe, (Henley-on-Thames); Messrs. Robertson and Scott, (Edinburgh); Mr. J. Cooper, (Muriham, Norfolk); Dr. J. H. Walker, (Tunbridge); Mr. J. L. Pritchett, (Great Grimsby); W. F.; J. S., (Birmingham); Parens; Bristolensis; Dr. Panelli; Medicus; One who was Present; Medicus, (Huddersfield); &c. &c.

## Sp. Vin. Rect. fully 56° overproof.—

We are now invoicing this fine Spirit at 18s. 6d. per Gallon, subject to a Discount of a Shilling for Cash on delivery in London; not otherwise.

HENRY BRETT & CO., Old Furnival's Distillery, Holborn.

## Dr. Ure and Dr. Letheby, having

analyzed our EAU DE VIE, concur in pronouncing it "a Spirit of undoubted purity, applicable to every purpose for which Brandy is required," and in several respects preferable to COGNAC. Imperial Gallon, 16s. A Case containing a Dozen French Bottles, with French labels, 31s. Cash.

HENRY BRETT & CO., Old Furnival's Distillery, Holborn.

## Brett's Ginger Brandy, for Diarrhoea.

A powerful astringent, carminative, and delicious Liqueur. Imperial Gallon, 18s. In Pint and Quart Wine-bottles, 20s. and 39s., by the Dozen. Beware of deleterious counterfeits.

HENRY BRETT & CO., Old Furnival's Distillery, Holborn.

## Allsopp's Pale Ale in Bottle, as

supplied to the CRYSTAL PALACE; also in casks of 18 gallons. Recommended by BARON LIEBIG.

Address, HARRINGTON PARKER and CO., 5½, Pall-Mall, London.

## Pale India Ale and Stout, 4s. 6d.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts; delivered free within four miles. Merchants supplied with Pale Ale and Porter for exportation at the lowest prices.

WOOD & WATSON, 16, Clement's-lane, City.

## Allsopp's Pale Ale.—Medical gentle-

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hoffmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTY, 132, Upper Thames-street, London.

## George Hanson's Sparkling Hop

CHAMPAGNE, Quarts 18s., Pints, 12s., Sparkling Nectar, 8s., bottles included; Hampers, 1s.

This new and exhilarating beverage, possessing the fine aroma and pure tonic properties of the Hop, with all the brilliancy of the foreign Champagne, stands unrivalled as a luncheon and dinner luxury. To Invalids it is invaluable, and can be taken without affecting the head—its habitual use assisting the digestion.

To Merchants and Captains it will be found an excellent article for Export—to Passengers in sea-sickness this restorative will be highly appreciated—it will be found a cool and refreshing drink at the Mess Table—and in Warm Climates most desirable.

G. H. has the greatest confidence in recommending the above, and the demand, which its excellence has created, is sufficient guarantee of its quality.

May be had at most of the Taverns and Refreshment Rooms in the neighbourhood of the Crystal Palace.

Sold Wholesale, Retail, and for Exportation, by the Manufacturer, GEORGE HANSON, 38, Clement's-lane, Lombard-street, City.

## Cocoa of the finest quality, prepared

in the best possible manner.—Our PURE GRANULATED COCOA was pronounced by the Analytical Chemists employed by THE LANCET, in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 6d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s., for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

## DOMESTIC ECONOMY

## H. Sparrow and Co. beg to announce

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.  
Fine Souchong, 3s. 4d., 3s. 8d., and 4s.  
Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.  
Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.  
Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 8d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

## To Invalids and those desirous of

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO'S HOMOEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

## Soyer's Aromatic Mustard.—"M.

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

## Robinson's Patent Barley, for making

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants, Children, and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS form another Diet universally esteemed for making a superior Gruel in Fifteen Minutes,—light for supper,—and alternately with the Patent Barley is an excellent Food for Children and Invalids, being particularly recommended by the Faculty as the purest and best Preparation of the kind extant, and far preferable to the Embden Groats.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets of 6d., and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

## Charing - cross Hospital Medical SCHOOL, WEST STRAND, LONDON.

WINTER SESSION, October, 1854, to March, 1855.

Chemistry—H. H. Lewis, A.M.

Anatomy—Mr. E. Canton.

Demonstrations and Dissections—Mr. Goldsbro.

Surgery—Mr. Hancock.

Physiology and Pathology—Dr. Hyde Salter.

Medicine—Dr. Chowne and Dr. Rowland.

SUMMER SESSION, May, 1855, to the end of July.

Practical Chemistry in the Laboratory—H. Lewis, A.M.

Materia Medica—Dr. Steggall and Dr. Willsheire.

Botany—F. W. Headland, B.A.

Midwifery, &c.—Dr. Chowne and Mr. Hird.

Medical Jurisprudence—Dr. G. Birkett and Mr. Hird.

All the Lectures required by the College of Surgeons and Society of Apothecaries, £45, without Practical Chemistry, which is £23 2s.

HOSPITAL PRACTICE.

Consulting-Physician—W. Shearman, M.D.

Physicians—Dr. Golding and Dr. Chowne.

Assistant-Physician—Dr. Rowland.

Surgeons—Mr. Hancock and Mr. Avery.

Assistant-Surgeon—Mr. E. Canton.

MEDICAL PRACTICE:—Full period required, £15 15s. Surgical, £15 15s. Both Medical and Surgical, £28 5s.

JOHN ROBERTSON, Hon. Sec.

## King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1854-5, will Commence on Monday, October 2, 1854.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.

Physiology and General and Morbid Anatomy—Professors W. Bowman, F.R.S., and Lionel S. Beale, M.B.

Chemistry—Professor W. A. Miller, M.D., F.R.S.

Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.

Principles and Practice of Surgery—Professor William Fergusson, F.R.S.

Logic and Natural Philosophy, as required by the Army Medical Board.

KING'S COLLEGE HOSPITAL.

The new Out-patient Department, and a large portion of the new building, will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by Professors Partridge and Fergusson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience for the attainment of Practical Chemistry, and for the prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the next Winter Session will have the exclusive privilege of contending for three Warneford Scholarships of £25 per annum, for three years. The subjects for the examination, which will commence on September 30, are, Divinity, Classics, Mathematics, History, and Modern Languages, equal marks being assigned to each subject. The classical books fixed on by the examiners for this year are the same as those announced for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £30, and three of £20 each, tenable for two years, will be filled up in April next, the subjects of the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or upon application to J. W. Cunningham, Esq., Secretary.

June, 1854.

R. W. JELF, D.D., Principal.

## The City and Borough Hospitals.—

A Hospital Physician, possessing ample means of instruction, who is acquainted by personal experience with the requirements of all the London Examining Boards, including the University of London, and whose residence is most conveniently situated in reference to the City and Borough Hospitals, has a Vacancy for a PUPIL.—For terms, &c., apply to Dr. Barnes, 13, Devonshire-square.

## Private Medical Tuition.—

A Physician of a practical and scientific reputation, residing near Russell-square, receives HOUSE-PUPILS, as well as others, whose Medical Education, in all its branches, will be carefully and privately instructed by teachers of great experience and acknowledged ability. As a private Medical School, this establishment offers unequalled facilities for enabling Medical Students to undergo the requisite Medical, Surgical, and Chemical Examinations at the different Boards. The Students may be instructed singly or in classes, as they may prefer.—Apply to THE LANCET Office.

N.B. A Chemical Laboratory on the Premises.

## Medical College, Royal Free Hospital.—

PITAL.—During the WINTER SESSION, 1854—55, whilst this Institution is undergoing the alterations and extensions required by the Royal College of Surgeons,

COURSES OF PRACTICAL INSTRUCTION ON ANATOMY AND SURGERY will be given by Dr. Knox (late Lecturer on Anatomy, Edinburgh), and by Mr. GALT, Co-Lecturers on Anatomy and Physiology.

Terms, and any further particulars may be obtained on application at the Office of the College.

## St. George's Hospital Medical School, LONDON.—SESSION, 1854-55.

The WINTER COURSE OF INSTRUCTION will commence on Monday, October 2nd, when the SCHOLARSHIPS and PRIZES for the past year will be awarded.

The Hospital contains 350 beds. Attendance of the Physicians and Surgeons daily, at One o'clock. Surgical Operations on Thursday, at One o'clock.

A Maternity Department, for the delivery of married lying-in women at their own homes, is established at the Hospital, under the superintendence of the Obstetric Physician.

Gentlemen becoming Pupils of the Hospital may attend all the Lectures, and the Medical and Surgical Practice necessary for those who desire to become Members of the Royal College of Surgeons, or Licentiates of the Society of Apothecaries, on paying Forty Guinea at the commencement of the first year, Forty Guinea at the commencement of the second year, and Twelve Guinea at the commencement of the third year.

The payment for the year will admit the Pupil to all the Lectures, and to the Hospital Practice required, for that year only.

Special entries to Hospital Practice, or to any separate Course of Lectures, may be made as heretofore.

Some of the Lecturers and other gentlemen connected with the Hospital receive Students to reside with them.

Further information may be obtained from the Secretary of the Hospital, or from Mr. Hammerton, the Apothecary of the Hospital, who is authorized to enter the names of Students.

## St. Thomas's Medical Session.—A

General Introductory Address will be delivered by SAMUEL SOLLY, F.R.S., on Monday, 2nd October, 1854, at Eight o'clock P.M. Gentlemen have the option of paying £40 for the first year, a similar sum for the second, and £10 for each succeeding year; or £90 at one payment, as Perpetual.

### SCHOLARSHIPS AND PRIZES FOR 1854-55.

A Scholarship of £20 for the best voluntary Classical and Mathematical examination, at the commencement of the Student's Hospital attendance.

Two Scholarships, for first year's men, each of the value of £20. The Two House-Surgeons, the Fifteen Dressers, and the Resident Accoucher, will be selected according to merit; and provided with Rooms and Commons in the Hospital, free of expense.

The President's Prizes. The first, 10 Guinea. The second, 5 Guinea. Prizes and Certificates of Honour, in each of the different Classes. Mr. Newman Smith's Prize, 25. The Cheselden Medal, and Dr. Root's Prize, 10 Guinea.

The Treasurer's Prizes. The first, a Gold Medal. The second, 5 Guinea. And Three of 10 Guinea to Clinical Medical Clerks.

### MEDICAL OFFICERS.

Dr. Roots, Consulting Physician; Mr. Green, Consulting Surgeon; Dr. Barker, Dr. J. Risdon Bennett, Dr. Gooldeen, Mr. South, Mr. Mackmurdo, Mr. Solly, Mr. Le Gros Clark, Mr. Simon, Dr. Peacock, Dr. Bristowe, Dr. Waller, Mr. Whitfield.

A Systematic Course of Clinical Medicine, with Clinical Instruction in the Wards.—Dr. Barker. Ophthalmic Surgery, Mr. Mackmurdo; Midwifery, Dr. Waller and Dr. Griffiths.

Medicine.—Dr. J. Risdon Bennett.

Surgery.—Mr. South.

Physiology.—Mr. Grainger and Dr. Brinton.

Descriptive and Surgical Anatomy.—Mr. Le Gros Clark and Mr. Rainey.

Chemistry and Practical Chemistry.—Dr. Et. Dundas Thomson.

Midwifery.—Dr. Waller.

Practical Midwifery.—Dr. Griffiths.

Diseases of the Teeth.—Mr. E. Saunders.

General Pathology.—Mr. Simon.

Botany.—Dr. Bristowe.

Comparative Anatomy.—Mr. Huxley.

Material Medica.—Dr. Peacock.

Forensic Medicine.—Dr. Brinton.

Anatomical Demonstrations.—Mr. Rainey, Mr. Barwell, and Mr. Jones.

Demonstrations in Morbid Anatomy.—Dr. Bristowe and Mr. Jones.

Microscopical Demonstrations.—Mr. Rainey.

To enter, or to obtain further information, apply to Mr. WHITEFIELD,

Medical Secretary, resident at the Hospital.

## House-Pupil.—Dr. Steggall will have

a Vacancy for a RESIDENT PUPIL in October next. Unusual advantages and assistance will be afforded for Study and Improvement.—For terms apply to Dr. S., 2, Southampton-street, Bloomsbury-square, London.

## Mr. G. Hind, F.R.C.S., will resume

his DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.

Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

### TO STUDENTS OF ST. BARTHOLOMEW'S HOSPITAL.

## Mr. Harvey Ludlow, 27, Charter-

house-square, receives into his house a LIMITED NUMBER of GENTLEMEN, whose Studies he undertakes to superintend, and who will experience under his roof the advantages of a comfortable home, situated in close proximity to the Hospital.—For particulars respecting terms apply, personally or by letter, to Mr. Henry Ludlow, 27, Charter-house-square.

EAST INDIA HOUSE, August 9th, 1854.

## Notice is hereby given, that the

annexed CODE OF REGULATIONS for the ADMISSION of CANDIDATES at the First Examination, to be held in January next, for the APPOINTMENT of ASSISTANT-SURGEONS in the service of the EAST INDIA COMPANY, has been framed by the Board of Commissioners for the Affairs of INDIA, under the provisions of the Act 16 and 17 Vict., cap. 95, sec. 38.

REGULATIONS FOR THE ADMISSION OF CANDIDATES FOR THE APPOINTMENT OF ASSISTANT-SURGEON IN THE SERVICE OF THE EAST INDIA COMPANY.

All natural-born subjects of her Majesty may be candidates for admission into the service of the East India Company as Assistant-Surgeons; they must, however, be between twenty-two and twenty-eight years of age, and of sound bodily health.

They must subscribe and send in to Dr. Scott, the Physician to the Hon. East India Company, before the 10th day of December, 1854, a declaration to the following effect:—

"I [Christian and surname at full length], a candidate for employment as an assistant-surgeon in the service of the East India Company, do hereby declare that I was — years of age on the — day of — last, and that I labour under no constitutional disease or physical disability that can interfere with the due discharge of the duties of a medical officer; and I also attest my readiness to proceed on duty to India within three months of receiving my appointment."

This declaration must be accompanied by the following documents:—

1. Proof of age, either by extract from the register of the parish in which the candidate was born, or by his own declaration pursuant to the Act 5th and 6th William IV., cap. 62.

2. A diploma in surgery or a degree in medicine, provided an examination in surgery be required for such degree, from some body competent by law to grant or confer such diploma or degree.

3. A certificate of having attended two courses of lectures, of six months each, on the practice of physic, and of having attended for six months the practice and clinical instruction of the physicians at some hospital containing at least, on an average, 100 in-patients, or of having attended one course of lectures of six months on the practice of physic and clinical instruction for twelve months.

4. A certificate of having attended for three months the practical instruction, given at one of the public asylums for the treatment of the insane.

5. A certificate of having attended for three months one of the institutions, or wards of a hospital, especially devoted to the treatment of ophthalmic disease.

6. A certificate of having attended a course of lectures on midwifery, and of having conducted at least six labours.

7. A certificate of having acquired a practical knowledge of cupping.

Candidates may also, at their option, send in certificates of attendance at any hospitals, or on any courses of lectures in addition to the above. Attendance on a course of military surgery is recommended.

Candidates producing satisfactory certificates will be admitted to an examination, to be held in January, 1855.

The examination will include the following subjects:—

1. Surgery in all its departments.

2. Medicine, including the diseases of women and children, therapeutics, pharmacy, and hygiene.

3. Anatomy and physiology, including comparative anatomy.

4. Natural history, including botany and zoology.

The examination will be conducted—

1. By means of written questions and answers.

2. By object examinations and experiments, when the subject admits of such tests.

3. By practical examination at the bedside of the patient, and by dissections and operations on the dead body.

4. By *visu voce* examination.

The persons who shall be pronounced by the examiners to be the best qualified in all respects, shall be appointed to fill the requisite number of appointments as assistant-surgeons in the East India Company's service.

All assistant-surgeons are required to subscribe to the military or medical, and medical retiring funds at the Presidencies to which they may be respectively appointed, and to the Military Orphan Asylum also, if appointed to Bengal.

All assistant-surgeons who shall neglect or refuse to proceed to India under the orders of the Court of Directors, within three months from the date of their appointments, will be considered as having forfeited them, unless special circumstances shall justify a departure from this regulation.

Candidates may apply to Dr. Scott, 13, Stratton-street, for further information, if needed.

N.B. The certificates and notices as to examination herein contained apply only to the examination to be held in January next.

Regulations regarding the requirements of candidates for future examinations will be issued after the first examination.

JAMES C. MELVILL, Secretary.

## Leeds School of Medicine.

TWENTY-FOURTH SESSION.

The WINTER SESSION will commence on Monday, October 2nd, 1864, when J. T. Ikin, F.R.C.S., President, will deliver the Introductory Lecture, at Twelve o'clock.

Anatomy, Physiology, and Pathology—Mr. Ikin, Mr. S. Hey, Mr. Wm. Nicholson Price, and Mr. C. G. Wheelhouse.  
Descriptive Anatomy—Mr. Wm. Nicholson Price, and Mr. C. G. Wheelhouse.  
Principles and Practice of Surgery—Mr. Hey and Mr. Nunneley.  
Chemistry—Mr. Morley and Mr. Scattergood.  
Principles and Practice of Physio—Dr. Chadwick and Dr. Heaton.  
Superintendent of Dissections—Mr. E. W. Ward.

SUMMER SESSION, 1865, Commencing May 1st.

Materia Medica and Therapeutics—Mr. Bishop.  
Midwifery and Diseases of Women and Children—Mr. Smith and Mr. Braithwaite.  
Forensic Medicine—Dr. Fremont Smith.  
Botany—Dr. Heaton.  
Practical Chemistry—Mr. Scattergood.  
Operative Surgery—

\* \* Application for Tickets may be made to the Treasurer, Mr. Samuel Hey, Albion-place.

N.B.—Attendance at the above Lectures will confer the same Qualification for Examination as is obtained in the Medical Schools of London.

Clinical Lectures will be given at the General Infirmary on Medical Cases, by Dr. Chadwick and Dr. Heaton; on Surgical Cases, at the General Infirmary, by Mr. Smith, Mr. T. E. Teale, and Mr. Samuel Hey; on Ophthalmic and Aural Practice, at the Eye and Ear Infirmary, by Mr. Nunneley. Medical Libraries are connected both with the School and the Infirmary.

## The Manchester Royal School of Medicine and Surgery, PINE-STREET, behind the Royal Infirmary. (Founded 1824).

WINTER SESSION, 1864-65.

The WINTER SESSION of this School will Open on Monday, the 2nd of October, at Twelve o'clock, when an Introductory Address will be delivered by Mr. CHILDS.

Anatomy and Physiology—Mr. Turner and Mr. William Smith.  
Microscopic Anatomy—Mr. William Smith.  
Practical Anatomy and Demonstrations—Mr. Lund.  
Medicine—Dr. Brown.  
Surgery—Mr. Orr.  
Chemistry—Dr. Allan.  
Clinical Medicine and Surgery, at the Royal Infirmary—the Physicians and Surgeons to the Hospital.

SUMMER SESSION, 1865.

Midwifery—Mr. Heath.  
Materia Medica—Mr. Childs.  
Forensic Medicine—Mr. Greaves.  
Botany—Mr. Grindon.  
General Pathology and Morbid Anatomy—Dr. Renand.  
Anatomy, Physiology, and Pathology of the Eye—Mr. Hunt and Mr. Lund.  
Practical Chemistry—Dr. Allan.  
Medals and Certificates of Honour will be awarded to the most distinguished Students.

Three Scholarships will be open for competition to the Students of the School, of the value respectively of—

- £20, tenable for Two Years;
- £15, tenable for One Year;
- £10, tenable for One Year.

The Register of Tickets for the Winter Courses is open from October 2nd to October 15th, 1864; and for the Summer Courses from May 1st to May 15th, 1865.

## Chatham-street School of Medicine, MANCHESTER.

The SESSION for 1864-65 will commence on Monday, October 2nd, when the Introductory Address will be delivered by Dr. WEIRHEAD, at Four P.M.

Extensive alterations have been made in the premises of this Institution during the recess. The present Lecture Theatre is considerably larger than the previous one, and is much better adapted both for hearing and for demonstration. The Museum has undergone complete review, and the various objects of interest have been so arranged and designated as to afford every facility to the Student in the prosecution of his studies.

Practical Chemistry will be taught during the present Session under the same roof, in additional premises, which have been already secured for the purpose.

The Lecturers have the pleasure of stating that Dr. Marshall Hall has kindly promised to deliver, sometime during the Session, a short Course of Lectures on "The Spinal System of Nerves and its Diseases," in the Lecture Theatre of this Institution, to which members of the Profession, in this locality, will be invited.

WINTER LECTURERS.—Mr. Southam, Mr. Dumville, Dr. Watts, Dr. Eason Wilkinson, Dr. Noble, Messrs. J. S. and J. O. Fletcher, Mr. Murphy, and Mr. Stone.

SUMMER LECTURERS.—Dr. Whitehead, Dr. Merel, Dr. Aikenshead, Mr. Somers, Dr. Jepson, Dr. Stone, Dr. Watts, and Mr. Stone.

HOSPITAL PRACTICE and Clinical Instruction at the Royal Infirmary.

SCHOLARSHIPS.—In addition to the usual Medals, Prizes, and Certificates of Merit, Three Scholarships will be offered for competition, at the termination of the Session, as follows:—

- One of £20—for Third Year's Students.
- One of £15—for Second Year's Students.
- One of £10—for First Year's Students.

Further particulars may be obtained from the Registrar, Mr. SOUTHAM, Salford, or from any of the Lecturers.

Chatham-street, Piccadilly. August, 1864.

## York School of Medicine.—Winter

SESSION will commence on Monday, October 2nd, 1864.

Anatomy and Physiology—Mr. Edward Allen and Mr. Hornby.  
Practical and Descriptive Anatomy—Mr. Hornby and Mr. North.  
Surgery—Mr. Kaywerth.  
Practice of Medicine—Dr. Lapecock.  
Chemistry—Mr. Procter.

SUMMER SESSION will commence May 1st, 1865.

Materia Medica—Mr. Williams.  
Midwifery—Mr. J. Allen and Mr. Anderson.  
Medical Jurisprudence—Mr. Procter.  
Botany—Mr. Moore.

The Introductory Address will be delivered in the Theatre of the Hospital, by Mr. HOWARD, October 2nd, 1864, at Two P.M.

Dr. LAYCOCK will include Clinical Lectures in his Course, in connexion with the practice of the York Dispensary.

Mr. HAY will deliver a regular Course of Clinical Lectures to the Pupils entering into the Medical and Surgical Practice of the York County Hospital.

An extensive Museum of Anatomy and Pathology is annexed to the School. Further particulars may be obtained by applying to Mr. JAMES ALLIE, Secretary to the York School of Medicine; or to any of the Lecturers.

## Newcastle-upon-Tyne College of Medicine, in connexion with the UNIVERSITY OF DURHAM.

This College is also in connexion with the University of London, and is recognised by the Royal College of Surgeons of England, and the Worshipful Society of Apothecaries of London; and the Council beg particularly to state, that the Courses of Lectures are equally open to all Students, whether they intend to Matriculate at the University of Durham, or to pass their Examination at the University of London, the Royal College of Surgeons, or the Society of Apothecaries.

Those Students who Matriculate at the University of Durham are enabled to proceed in the first place to a License in Medicine, and then to the Degree of M.B. and M.D. in that University.

The WINTER SESSION will commence on Monday, October 2nd, 1864, at Two o'clock, when the Venerable CHARLES THORP, D.D., F.R.S., Warden of the University, or some other Authority of the University, will be present to confer the Exhibition and Certificates of Merit.

An Introductory Address will be delivered by Dr. EMBLETON.

Anatomy and Physiology—D. Embleton, M.D., F.R.C.S., Reader in Medicine in the University of Durham, Physician to the Newcastle Infirmary; and C. J. Gibb, M.R.C.S., House Surgeon to the Newcastle Infirmary.  
Surgical Anatomy and Demonstrations—J. S. Pearce, M.R.C.S., House Surgeon to the Newcastle Dispensary.

Principles and Practice of Physic—Edward Chariton, M.D., Physician to the Newcastle Infirmary, &c.

Mental Diseases—Donald Macintosh, M.D., Physician to the Newcastle Lunatic Asylum.

Principles and Practice of Surgery—Henry Heath, F.R.C.S., Surgeon to the Newcastle Infirmary; and G. Y. Heath, M.B., M.R.C.S., Surgeon to the Newcastle Eye Infirmary.

Principles of Chemistry—T. Richardson, Ph.D.  
Resident Medical Tutor and Demonstrator of Anatomy—J. C. Penny, M.R.C.S.

The Duty of the Resident Medical Tutor and Demonstrator of Anatomy is to assist the Students living in the College, as well as the Non-Resident Students, in the Subjects of the Lectures, and to superintend the Dissecting Rooms.

Perpetual Tickets to all the Lectures, qualifying for the Diploma of the College of Surgeons, and the License of the Apothecaries' Society (exclusive of Practical Chemistry)—Forty Guineas.

The required Hospital Practice can be attended at the Newcastle Infirmary, which is duly recognised, and in which Clinical Lectures are regularly delivered. The Infirmary contains 230 Beds. Fees for Medical and Surgical Practice—Twelve Months, Seven Guineas; Perpetual Ticket, Seventeen Guineas.

An Exhibition, amounting to £15 per Annum, Tenable for Two Years, and open to all the Students of the College, will be awarded at the termination of the Session.

Students who are Members of the University of Durham are eligible to Scholarships in the University.

The Book of Registration will be closed on the 21st of October.

NEVILLE HALL, NEWCASTLE-UPON-TYNE.

Principal—The Rev. JAMES RAINY, M.A.

This Hall was opened in October, 1862, by the University, for the Reception of all Students who wish to avail themselves of its Advantages.

The Hall is under the charge of a Resident Principal, to whom the general Superintendence of the Students is entrusted, to whom Applications may be addressed.

REFURISH.

Rooms Furnished, (except Linen,) Board, Servants, and all other Domestic Charges, (except washing,) forty weeks, £42; Censor's Fees, £8. Total £50. Further Particulars may be learned of any of the Lecturers, and Tickets obtained from the Registrar.

D. EMBLETON, M.D., Registrar.  
J. S. PEARCE, Secretary.

Newcastle-upon-Tyne, August 2nd, 1864.

## Matrimonial Institution.—Founded

1846.—Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CUTBERT, 12, John-street, Adelphi, London.

## Society for the Relief of Widows and

ORPHANS OF MEDICAL MEN IN LONDON AND ITS VICINITY,  
(Founded 1798), 63, BERNERS-STREET, OXFORD-STREET.  
Members are reminded that a QUARTERLY COURT OF DIRECTORS will be held on WEDNESDAY, the 20th instant, at which Candidates for admission into the Society can be proposed. It is desirable that the form of proposal be filled up and forwarded to the Secretary a few days before the Meeting. All legally qualified Medical Practitioners residing in any part of the County of Middlesex, or within seven miles of the General Post-Office in St. Martin's-le-Grand, are eligible; and the benefits of the Society are restricted to the Families of deceased Members of not less than two years' standing.  
63, Berners-street, Oxford-street. CHARLES E. WALSH, Sec.

## Provincial Medical and Surgical

ASSOCIATION.—ANNIVERSARY MEETING, 1854.—The Members and Friends of the PROVINCIAL MEDICAL AND SURGICAL ASSOCIATION are informed that the TWENTY-SECOND ANNIVERSARY of the ASSOCIATION will be held at MANCHESTER, on WEDNESDAY, the 13th, and THURSDAY, the 14th of SEPTEMBER next.

The Council of the Association will meet at half-past seven o'clock on Tuesday evening, September the 12th, in the Lecture Theatre of the Royal Institution, Molesley-street.

The First General Meeting of the Association will be held in the same place, on Wednesday Morning, September the 13th, at ten o'clock, when the President, GEORGE GWYNNE BIRD, M.D., of Swansea, will take the Chair, and afterwards resign it to the President-Elect, WILLIAM JAMES WILSON, Esq., F.R.C.S., Senior Surgeon to the Manchester Royal Infirmary.

Members and Visitors arriving in Manchester are requested to apply at the Royal Institution, Molesley-street, when, on registering their names, they will be supplied with Tickets of admission to the Meetings of the Association, and the several Public Institutions, Manufactories, and other objects of interest, which will be open for the inspection of visitors.

PHILIP H. WILLIAMS, M.D.,

Secretary to the Association.

Gentlemen having Papers or Cases to lay before the Meeting, are requested to give notice of the same to the Secretary, as they will be read in the order in which such notice is given.

## Marischal College and University of

ABERDEEN.

Charter Ratified by Act of Parliament—A.D. 1563.

CHANCELLOR—His Grace the Duke of Richmond and Lennox.

RECTOR—Colonel Wm. Sykes, Hon. E. I. C. Service.

DEAN OF FACULTY—Alex. Thomson, Esq., of Banchoy.

PRINCIPAL—The Very Rev. Daniel Dewar, D.D. and LL.D.

### FACULTY OF MEDICINE.

WINTER SESSION of 1854-55, of Six Months' duration, Commences on Monday, the 6th of November.

#### CLASSES.

Anatomy—Professor A. J. LIZARS. 12 noon, £3 3s.  
Practical Anatomy, and } Professor A. J. LIZARS, and } 2 P.M., £2 2s.  
Anatomical Demonstrations } Dr. Beveridge.  
Chemistry—Dr. Clark (Mr. Brazier, Assistant). 3 P.M., £3 3s.  
Practical Chemistry—Dr. Clark and Mr. Brazier. 11 A.M., £3 3s.  
Materia Medica—Dr. Henderson. 9 A.M., £3 3s.  
Institutes of Medicine—Dr. Ogilvie. 4 P.M., £3 3s.  
Practice of Medicine—Dr. Macrobin. 3 P.M., £3 3s.  
Surgery—Professor Wm. Pirrie. 1 P.M., £3 3s.  
Midwifery, and Diseases of Women and Children—Dr. Dyce. 4 P.M., £3 3s.  
Natural History—Professor Nicol. 11 A.M., £3 3s.

Janitor's Fee for each of the above Classes, 2s. 6d.—No other Fees are charged.

The following subjects are taught during the SUMMER SESSION, of Three Months' duration, commencing 3rd May:—

Botany— 8 A.M., £2 2s.  
Practical Anatomy and Demonstrations—Professor A. J. LIZARS and Dr. Beveridge. 12 noon, £2 2s.  
Medical Jurisprudence—Dr. Ogston. 9 A.M., £2 2s.  
Dietetics and Hygiene—Dr. Henderson. 1 P.M., £2 2s.

The various Courses delivered at this University qualify for examination here, and at the Universities of London, Dublin, Oxford, Cambridge, Glasgow, and St. Andrews; the Royal Colleges of Surgeons of England, Edinburgh, and Ireland; the Apothecaries' Hall, London; and the Medical Boards of the Army and Navy, and Hon. East India Company.

Graduates who have attended the several Medical Classes in this University will be charged no Graduation Fees.

### HOSPITAL PRACTICE AND CLINICAL LECTURES.

Hospital Practice daily, at Ten o'clock, at the Royal Infirmary, which contains upwards of 280 beds.

#### PHYSICIANS.

Dr. Dyce.

Dr. Kilgour.

Dr. Nicol.

Dr. Williamson.

Lectures on Clinical Medicine, by Dr. Kilgour.

Lectures on Clinical Surgery, by Wm. Keith, Esq.

The perpetual Fee to the Hospital, £5 5s. This sum may be paid in one, or in separate payments of £2 2s. at the commencement of each Session.

### THE LUNATIC ASYLUM.

Under the care of Dr. Macrobin, Consulting Physician, and Dr. Robert Jamieson, Resident Physician, contains about 280 Patients. A limited number of Pupils is permitted to witness the Practice pursued in this Asylum in the treatment of Mental Diseases.

A Course of Clinical Instruction in the treatment of Insanity is given during the Summer Session by Dr. Jamieson, the Medical Superintendent. Fee, £2 2s.

Besides the College Library, there is in the Hall of the Medico-Chirurgical Society of Aberdeen, a Medical Library, containing 4000 volumes, with a Reading-Room attached. Admission to the Society by ballot.

Terms for Students, £1 1s. yearly.

The Autumn Graduation Term will be held in the third week of October. For particulars, both in the case of Students and Practitioners, application may be made to the SECRETARY of the University.

### MEDICAL SCHOOL.

## Anderson's University, Glasgow.—

The WINTER SESSION will begin on Tuesday, November 7th, 1854. Lectures will be delivered daily for six months on the following branches of Medical Science:—

Anatomy..... Dr. M. S. Buchanan  
Anatomical Demonstrations } and  
Practical Anatomy } Dr. George Buchanan.  
Surgery—Dr. Hunter.  
Principles and Practice of Medicine—Dr. A. Anderson.  
Institutes of Medicine—Dr. Eben. Watson.  
Materia Medica, Pharmacy, and Dietetics—Dr. Easton.  
Chemistry—Dr. Penny.  
Practical Chemistry—Dr. Penny.  
Midwifery and Diseases of Women and Children—Dr. Paterson.  
Medical Jurisprudence and Police—Dr. Crawford.  
Natural Philosophy (three times a week)—Dr. Taylor.  
Mathematics—Mr. Laing.

Summer Courses of Anatomy, Midwifery, Chemistry, Materia Medica, and Botany, begin in May.

Botany—Mr. Ball.

Fee for each Class, £2 2s. Perpetual, £3 3s.

The general Fee for all the classes required for passing the College or Hall, including Hospital Practice, amounts to £40.

Certificates of attendance on the above courses are received by the Universities of Oxford, Cambridge, London, Aberdeen, and St. Andrew's; by all the Royal Colleges of Surgeons in Great Britain and Ireland; by the Faculty of Physicians and Surgeons in Glasgow; and by the Army, Navy, and East India Boards; and the Apothecaries' Company.

Students attending the Medical Classes have the opportunity of witnessing the practice of the following hospitals:—viz. Lying-in Hospital, No. 6d. for six months; Eye Infirmary, £2 2s. for six months; Royal Infirmary, £2 2s. for two years, including Medical and Surgical Clinical Lectures, which are delivered four times weekly. The patients admitted to the Eye Infirmary average 1100 annually; those admitted to the Royal Infirmary, nearly 3000; besides 6000 out-patients treated at the Dispensary. Average number of surgical operations 200 annually.

The Dissecting-room is free to those attending either of the above Courses of Anatomy, and attached to it there is a Reading-room and Museum for the use of the Anatomical Students. A valuable Medical Library is also attached to the Medical School.

The new and extensive Laboratory of the Institution, fitted up expressly for gentlemen desirous of pursuing Practical and Analytical Chemistry, is open daily from eleven till four o'clock. No charge for apparatus and materials in the class for Practical Medical Chemistry.

The University Museum, a splendid collection of specimens of Natural History, including more particularly those of Zoology, Mineralogy, and Antiquities, is open to all Students attending the University.

Further information may be obtained by applying to Dr. ANDREW ANDERSON 2, Woodside-crescent, Glasgow.

## Eastern Dispensary of Bath.—A

RESIDENT MEDICAL OFFICER is required, who must possess the Diplomas of a Royal College of Surgeons and Society of Apothecaries. The salary is £200 per annum, with furnished apartments, and an allowance of £20 for coals, candles, and servant. The Election lies with the Governors and Subscribers entitled to Vote, and is appointed to take place on the 28th day of September instant.

Testimonials (post paid, and marked "Eastern Dispensary") to be forwarded on or before September 19th, to E. TURNER PAYNE, Esq., Honorary Secretary, 5, Old King-street, Queen-square, Bath, who will afford any further information required.

### TO THE MEDICAL PROFESSION.

## Hanwell Lunatic Asylum.—A

Vacancy has occurred in the Office of RESIDENT MEDICAL OFFICER of the Female Department of the Middlesex County Pauper Lunatic Asylum at Hanwell; and gentlemen desirous to become Candidates for the appointment must be Fellows or Members of the Royal College of Surgeons, and Members or Licentiates of the Apothecaries' Company, married, and between thirty and fifty years of age. The salary will be £200 per annum, with board, including coals and candles, and residence at the Asylum.

Candidates are requested to send in testimonials, addressed to the Committee of Visitors of the Hanwell Lunatic Asylum, on or before the 2nd of October next, under cover to me, at the Sessions House, Clerkenwell-green, where information as to the duties to be performed may be obtained; and they must personally attend the Committee of Visitors, at the Sessions House aforesaid, on Friday, the 13th day of October, at Eleven o'clock precisely, on which day the Election will take place.

CHARLES WRIGHT, Clerk to the Visitors.

Dated this 24th of August, 1854.

### TO THE MEDICAL PROFESSION.

## Dorset County Lunatic Asylum,

Forston, near Dorchester.—A Vacancy having occurred in the office of RESIDENT MEDICAL OFFICER of the Dorset County Lunatic Asylum, in consequence of the death of Mr. Sandon, the late Medical Superintendent, Gentlemen desirous of becoming Candidates for the Appointment, must be Members of the Royal College of Surgeons, London, and also Licentiates of the Apothecaries' Company, or Members of the Royal College of Physicians, London or Edinburgh; must have had experience in the treatment of the Insane, and the management of a Lunatic Asylum, and must not be under thirty years of age. The Salary will be £200 per annum, with Board and Residence at the Asylum.

Candidates are requested to send their Testimonials (stating age) addressed to the Committee of Visitors of the Forston Lunatic Asylum, on or before the 15th September next, under cover to Mr. John Brown, Dorchester, Clerk to the Visitors, from whom further information may be obtained. Due notice of the day and hour of Election will afterwards be given to such of the Candidates as the Committee may select for choice, and they will be informed whether their personal attendance will then be required.

Dated the 26th August, 1854.

## Lincolnshire County Lunatic

ASYLUM.—A Vacancy having occurred in the appointment of ASSISTANT MEDICAL OFFICER in this Institution, Gentlemen who may wish to become Candidates, are requested to send in their applications, together with testimonials and a statement of qualifications, to Dr. Palmer, at the Asylum, Bracebridge, Lincoln, on or before Saturday, the 23rd of September inst. Salary £50 per annum, with board, residence, &c., in the Asylum.

## Halifax Infirmary and Dispensary.

Wanted, a RESIDENT MEDICAL OFFICER to the above Institution, who is required to be a Licentiate of the Society of Apothecaries. The salary is £80 per annum, with Board and Lodging, and a Compounder is provided. The appointment is vested in the Medical Staff, and will take place on Wednesday, the 27th of September next. Testimonials to be sent in by Saturday, the 23rd of September, addressed to the Venerable Archdeacon Musgrave, D.D., President of the Institution, Halifax.

Halifax, August 23rd, 1854.

## Kidderminster Infirmary.—Wanted,

a HOUSE-SURGEON to this Institution, who will be required to act as SECRETARY. Salary £90 per annum, with furnished rooms, coals, and candles. He must be a M.R.C.S. of London, Edinburgh, Dublin, or Glasgow, and will be required to enter into a Bond not to practise within six miles of the town of Kidderminster for five years after he leaves the Infirmary.—Applications, stating age, accompanied by testimonials, to be forwarded to the Committee at the Infirmary, on or before the 12th of September next.

August 23rd, 1854.

## House-Surgeon Wanted for the

LANCASTER GENERAL DISPENSARY AND HOUSE OF RECOVERY. Salary £90 per annum, with furnished apartments, coals, and gas. Testimonials of moral and professional character must be sent in to the President at the Institution, on or before the 22nd; and the Election will take place on the 29th inst. The Gentleman elected will have to commence his duties on the 15th of October next.

Lancaster, September 4th, 1854.

## St. Marylebone General Dispensary,

77, WELBECK-STREET, CAVENTISH-SQUARE.—Notice is hereby given that a Vacancy having occurred in the Office of RESIDENT APOTHECARY to this Institution by the resignation of Mr. BERTIE PANDOR MATTHEWS, the Directors will meet at the Dispensary on Wednesday, the 20th of September instant, to receive applications for filling the vacant Office. Every Candidate for the Office must be a Licentiate of the Society of Apothecaries, London, and must personally attend the Board on the above-named day, at Eleven o'clock in the Forenoon precisely, with a written application, and produce his qualifications and testimonials. The Salary is One Hundred Guineas per annum.

By order of the Board,

September 6th, 1854.

PETER MATTHEWS, Secretary.

## Wanted, for the Bradford Infirmary

and DISPENSARY, a HOUSE-SURGEON, who will be required to engage for three years. He must be a Member of the Royal College of Surgeons, or a Licentiate of the Apothecaries' Company. Salary £80 per annum, with board and residence. The duties of the House-Surgeon will be to take the general superintendence of the patients in the House, which contains sixty beds, and also to visit the Home Patients of the Dispensary Department. There is an Assistant House-Surgeon, and also a Dispenser to the Institution. The diplomas and testimonials of Candidates must be sent to the Secretary, Mr. C. Woodcock, Sun Bridge, Bradford, on or before the 18th instant; and the Election will take place on Wednesday, the 27th instant, at Half-past Three o'clock in the afternoon. Married Gentlemen are ineligible. The Gentleman elected will be required to enter upon his office not later than one week after his appointment.

## A Physician is required for the

STAMFORD-HILL, STOKE NEWINGTON, CLAPTON, WEST HACKNEY, KINGSLAND, and DALSTON DISPENSARY.—Notice is hereby given that a Vacancy has occurred in the Office of PHYSICIAN to this Institution by the resignation of Dr. SIEVEKING. By the Rules of the Institution the Office is gratuitous, and must be filled by a Member of the Royal College of Physicians of London. There are two Physicians to the Institution, and one is required to attend at the Dispensary, Stoke Newington, four days in each week, but the days on which each attends is fixed by arrangement with the other Physician.

Applications for this appointment are to be addressed to the Honorary Secretaries at the Dispensary, Stoke Newington, on or before the 18th day of September instant.

By order of the Committee,

F. B. ROBERTS,

JOHN CASTLE GANT, } Honorary Secretaries.

## Improved Invalid Cot Carriages—

the greatest luxury and comfort ever introduced for removing invalids, being fitted up with the patent noiseless wheels. These carriages may be engaged, on moderate terms, for any journey, upon application to H. and J. READING, coachbuilders, 14, Riding House-lane, Cavendish-square.—N.B. A good assortment of new and second-hand carriages for sale or hire.

## Cholera Prevented! Rettie's Patents.

SELF-ACTING SEWER AND SINK TRAPS, for Streets and Kitchen Sinks, to prevent all effluvia from Drains, Cesspools, and Urinals. Damp Houses cured at Fourpence per day, giving a dry, warm temperature, for sick or invalids.

PORTABLE CHAMBER CLOSETS, free from all effluvia.

Orders to E. M. and M. Rettie, 7, Brompton-road. (Enclose Stamp.)

N.B.—Beware of imitations on the above Patents.

TO THE PROFESSION.

## Mr. Bowmer, M.R.C.S. Eng., 50,

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

## A Gentleman, who has matriculated

at the London University and Apothecaries' Hall, wishes to assist a Practitioner during the hours not required for his hospital studies, in consideration of board and lodging.—Apply to Mr. Monson Hills, Guy's Hospital.

## A Gentleman, possessing both quali-

fications, is desirous of entering into an engagement with a General Practitioner in the country as Visiting ASSISTANT. The highest references can be given.—Address, X. Y., Post-office, Ipswich, Suffolk.

## Surgeon Wanted for a First-class

Al Private Passenger SHIP, proceeding direct to New Zealand in about a fortnight. Favourable terms would be offered to a family man wishing to settle in the Colony.—Apply to F. Young and Co., 74, Cornhill, London.

## A Surgeon about to go abroad will

give up a good PRACTICE in the country, with Public Works attached, on easy terms. This Practice is within thirteen miles of Glasgow, in an excellent locality for an energetic Young Man.—For further particulars apply, by letter, to Oxonian, Herald Office, Glasgow.

MEDICAL.

## For Disposal, a well-established

GENERAL PRACTICE, in a small railway town situate in the south of Yorkshire. Such an opportunity seldom offers for the safe transfer of £350 to £400 per annum.—Address, A. Z., Messrs. Butterfield and Clark, Wholesale Druggists, York.

## A Third Year's Student, at one of

the Borough Hospitals, wishes to meet with a Surgeon in the Vicinity with whom he could reside during the ensuing Winter Session, in return for which he would assist in Visiting and Dispensing.—Address, Omega Post-office, Putney, Surrey.

## A Medical Gentleman, residing near

Finsbury-square, connected with one of the Public Institutions, who assists Gentlemen to pass the Hall and College, has a Vacancy for a PUPIL, or could accommodate one or two Gentlemen with Board, or partial Board and Lodgings, on reasonable terms. References can be given.—Address to C. B., 34, Wilson-street, Finsbury-square.

MEDICAL.

## Wanted, by a Gentleman, aged 30,

accustomed to Dispense, Visit, and attend Midwifery, and whose testimonials to character and professional ability are unexceptionable, a SITUATION on or near the Coast.—Address to A. B., Post Office, Edgeware, near London.

## An Assistant is required to take the

Charge, under the direction of the Principal, of a BRANCH PRACTICE, in one of the North-Western Counties. Steady habits and professional efficiency indispensable.—Address, stating age and two references, to Mr. Hayes, Surgeon, Poynton, Cheshire.

## Medical Residence and Practice,

near Belgrave-square.—The LEASE with immediate possession of a MEDICAL RESIDENCE, in a fashionable district, can be obtained by purchasing the appropriate Furniture and Fixtures, at a fair valuation. A Practice of several years' standing can thus be acquired without premium.—Apply to Mr. Robert Reid, 48, Great Marlborough-street.

## Wanted, by an M.D. and M.R.C.S.,

Edinburgh, Unmarried, aged twenty-six, who has had some years' experience, and possesses superior testimonials, a PARTNERSHIP in a good GENERAL PRACTICE in England, where the proprietor is in want of active assistance, and would not object to receive a premium by yearly instalments.—Address, D. M., Mr. McLeane, Chemist and Druggist, St. Andrew-square, Edinburgh.

## Insanity and Nervousness.—In a

small Establishment, conducted by a Lady, two or three PATIENTS can be RECEIVED on very moderate terms. Every possible care, attention, and kindness, is observed, and the fullest confidence may be placed in the advertiser. References of the first respectability will be offered.—Apply by letter, or personally, to Miss Lush, York House, Battersea, Surrey.

TO MEDICAL STUDENTS AND OTHERS.

## Appartments furnished, with attend-

ance, in the house of a professional gentleman, in a central and agreeable part of London, close to the British Museum, and less than half-a-mile from the Middlesex, University College, Charing-cross, and King's College Hospitals. Terms average £1 per floor weekly; single rooms, 10s.—Address, 13, Caroline-street, Bedford-square.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.

Office hours from 12 till 4.

**Surgeons requiring Appointments in**

Vessels sailing to INDIA or the AUSTRALIAN COLONIES, may hear of vacancies on application to J. W. Horder and Co., Druggists, 85, Minorities.

**MEDICAL.**

**Wanted immediately, an Assistant,**

fully qualified to practise all the Branches of the Profession.—For particulars, apply personally to Corbyn and Co., 300, Holborn.

**Medical Assistant.—Required by a**

General Practitioner, a Gentleman for Dispensing and occasional Visiting.—Apply personally, before eleven A.M., or after seven P.M., to E. May, Esq., 16, Mount-place, London Hospital.

**Wanted, an Assistant duly qualified,**

by acquirements, manners, and address, to Visit Patients in a first-class Practice. He will be required to board himself, but will be lodged, and receive a liberal salary. Apply to Messrs. Corbyns and Co., 300, Holborn.

**An Assistant, aged twenty-nine, of**

gentlemanly habits, accustomed to Visit, Dispense, and attend Midwifery, desires an ENGAGEMENT. Address L. M. N., 53, Howland-street, London.

**Wanted by a General Practitioner,**

an ASSISTANT to Dispense, occasionally Visit and attend Midwifery.—Apply, by letter, to M.D., THE LANCET OFFICE, 423, Strand, stating age and salary required.

**A Small Practice in a rich and agri-**

cultural district, may be had on very reasonable terms. There is a comfortable House and some Land attached.—Apply by letter to A. B., care of Messrs. Hodgkinson and Tonge, 213, Upper Thames-street, London.

**MEDICAL.**

**Wanted, by the Advertiser, aged**

thirty-two, a Situation to Dispense, Prescribe, and Keep the Books. Can give unexceptionable references, both in town and country.—Address, E. B., 5, Grovenor-street, Commercial-road East.

**TO GENERAL PRACTITIONERS.**

**Wanted, by a Gentleman, fully com-**

petent to Dispense, perform the Minor Operations, &c., a RE-ENGAGEMENT. Satisfactory references as to character and ability.—Address F. G., Post-office, Witney, Oxon.

**A General Practitioner in the country**

requires an Out-door ASSISTANT to Visit, Dispense, and attend Midwifery. Salary equal to £100 a-year. A married man without family preferred.—For particulars, apply personally, or by letter, to Henry Renshaw, 356, Strand.

**Medical Pupil.—A Surgeon in ex-**

tensive Country Practice requires an active, intelligent Youth, as an APPRENTICE. One knowing a little of Dispensing, and wishing to improve himself, would not be objected to.—Address, L. M., Kimbolton, Huntingdonshire.

**Assistant.—A Second Year's Man,**

at one of the Borough Hospitals, is desirous of obtaining a Situation with a Medical Man, who would consider his services as equivalent for board, lodging, and permission to attend Lectures and Hospital Practice.—Address, A. B. C., 23, New North-road, Huddersfield, Yorkshire.

**TO MEDICAL PRACTITIONERS.**

**A young M.D. of Edinburgh is open**

to an immediate Engagement as ASSISTANT to a general Practitioner. Town or a Colliery district preferred. Certificates as to character and qualifications can be given.—Apply to M.D., Messrs. Robertson and Scott, Advertising Agents, Edinburgh.

**TO GENERAL PRACTITIONERS AND OTHERS.—OUT OF LONDON**  
PREFERRED.

**The Advertiser is desirous of meet-**

ing with a Medical Gentleman who wishes to increase his Dental Practice, but is prevented from doing so from excess of Private Practice. A. B. has been accustomed to Private Practice, and in course of time would have no objection to Partnership.—For further particulars, apply, per post, to A. B., 16, Featherstone-buildings, Holborn.

**Medical Transfer and Partnership.**

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RESIGN, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

**Medical Practice.—To be Disposed**

of immediately, in consequence of sudden illness, the SUCCESSION to a highly-respectable PRACTICE. As little introduction can be given, the sum required is small, but a well qualified Practitioner of good address would have every chance of success.—Apply to Knight and Udall, Solicitors, Newcastle-under-Lyme, Staffordshire.

**TO SURGEONS, &c.**

**A Married Medical Man, about 35**

years of age, is desirous of meeting with a small SHARE in a well-established COUNTRY PRACTICE, within sixty miles of London, as JUNIOR WORKING PARTNER. A small premium will be paid.—Direct to A. B., care of Mr. Gordon, 17, Hemingford-cottages, Richmond-road, Islington, London.

**MEDICAL.**

**Visiting and Dispensing Assistant.**

A Married Gentleman, aged thirty, a Member of the College of Surgeons, about leaving his present Situation, is desirous of again Engaging himself as an Out-door ASSISTANT. He has been accustomed to the general routine of Country Practice. Satisfactory references and testimonials as to character can be given.—Address J. L. F., Wellow-gate, Great Grimsby.

**MEDICAL.**

**To be disposed of, a General Practice,**

in a Market Town, in one of the Midland Counties, about sixty miles from London, conveniently situated for the rail. The Practice has been established many years, and the connexion is highly respectable; receipts between six and seven hundred per annum.—For particulars, apply to Messrs. Gale, Baker, Warde, and Oldfield, Wholesale Druggists, Bouverie-street, Fleet-street.

**TO SURGEONS AND PRIVATE PRACTITIONERS.**

**Wanted, by a Young Man, a Situa-**

tion as Dispensing ASSISTANT. Writes a good hand, and understands Book-keeping. Salary not so much an object as the obtaining a comfortable Situation, which allows leisure for improvement. Has been six years and a half in the Profession.—Apply, by letter only, prepaid, to F. R., care of Mr. Lawson, Surgeon, 13, Cleveland-street, Fitzroy-square.

**A Gentleman, aged 25, of con-**

siderable experience in his profession, and a thorough Obstetrician, being about to attend a few Lectures, would be happy to give the whole of his time, not so employed, to the efficient Assistances of a Gentleman within a moderate distance of Charing-cross or the Westminster Hospitals, in return for his Board and Lodging. The highest references available. Address, C. L., Post-office, Lower Tooting.

**Country Practice Wanted.—A**

Gentleman, between thirty and forty years of age, married, and of much experience, having been out of Practice for some time, in consequence of ill-health, is now desirous of Purchasing an Introduction to a respectable Connexion in a small Town or populous Village. He would not object to a PARTNERSHIP with an elderly practitioner, who might wish to retire in two or three years.—Address, stating full particulars, X. Y. Z., THE LANCET OFFICE, 423, Strand.

**To be Sold, or Let for a term, on the**

South Coast of Devon, a House well adapted for a Hydropathic Establishment, or for a Medical Man to receive Patients afflicted with Chest-complaints. The rooms are large and airy, the Offices particularly convenient, and the Water on the premises very abundant and good. The House is modern, and was built by the Proprietor, lately deceased, with a special view to comfort. It stands in its own grounds, of about eleven acres, well sheltered from the north and east; is one of the healthiest, as well as most beautiful spots in England, commanding magnificent land and sea views, and in a retired neighbourhood, surrounded by quiet, warm, green lanes, accessible from the grounds of the residence; within five minutes' walk of the Church, in which there is a large pew belonging to the property.—Apply to Messrs. May and Sweetland, 14, Queen-square, Bloomsbury, London.

**TO MEDICAL MEN OF CAPITAL.**

**The Inventor and Patentee of a**

new but not secret Medical Remedy, the very superior merits of which may be easily and at once ascertained, is desirous of meeting with a Medical Gentleman who would take a share in the Invention, with a view to promote its general and speedy introduction into the Hospitals and among professional men. The sale augurs exceedingly well already, and with the assistance looked for, it must in less than a year become all but unlimited. Capital wanted, £1000, for which either a share in the Patent for fourteen years and in the profits, or, if so preferred, ample security in goods, &c., and a high percentage, would be given, besides a bonus on the profits, which are very considerable. First-class references given and required.—Apply to A. O., at Mr. Taylor's, 33, Great Castle-street, Regent-street.

# DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,  
AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM,  
AND ALL SCROFULOUS DISEASES.

Approved of and recommended by **BERZELIUS, LIEBIG, WOEHLER,**  
**JONATHAN PEREIRA, FOUQUIER,** and numerous other distinguished scientific Chemists.

Prescribed by the most eminent Physicians, and supplied to the leading Hospitals of Europe.

Specially rewarded with Medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—  
effecting a cure or alleviating symptoms much more rapidly.

Contains iodine, phosphate of lime, volatile acid, and the elements of the bile—in short, all its most active and essential  
principles—in larger quantities than the Pale Oils made in England and Newfoundland, deprived mainly of these by their  
mode of preparation.

*The following Extracts are selected from some of the leading Medical and Scientific Testimonials in favour of*  
**DR. DE JONGH'S COD-LIVER OIL:—**

**BARON LIEBIG,**

Professor of Chemistry at the University of Giessen, &c. &c.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use."

The late

**DR. JONATHAN PEREIRA,**

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

**Dr. FOUQUIER,**

Professor at the University of Paris, Physician to his late Majesty Louis Philippe, &c. &c.

"You have preserved to science the use of a medicine that might have fallen into utter discredit, in consequence of its unaccountable inaction in some cases."

**Dr. E. RIEGEL,**

Of Karlsruhe, Grand Duchy of Baden.

"This analysis has convinced me that Dr. de Jongh's Oil is not only prepared with greater care than the ordinary Cod-liver Oil, but that it contains in larger quantities those principles which are generally admitted to be most active and essential, so that it ought to be considered the most efficacious kind."

**Dr. SEGNIß,**

Of Gelnhausen, Duchy of Hessen.

"I am bound to state that this Oil is greatly superior to all other kinds previously used by me, and that, therefore, the object aimed at by the use of this remedy is more surely attained by this Oil than by any other kind."

The

**INTENDANT OF THE CIVIL LIST OF BELGIUM.**

"The King has charged me to return you his very particular thanks for the homage done to him, by the presentation of your most valuable researches concerning the Cod-liver Oil: as an expression of his utmost satisfaction, he has given me the order of presenting you with the accompanying large Gold Medal."

**Dr. VAN DEN STEDEN,**

Emmerich.

"I CAN conscientiously recommend it to my colleagues as being superior to all other kinds."

The

**MINISTER OF THE INTERIOR OF HOLLAND.**

"I HAVE the honour of bringing to your knowledge, that it has pleased the King to grant you, by his Decree of the 20th January, 1854, No. 101, a Silver Medal with an appropriate honorary inscription, as a testimony of his Majesty's high approbation for your efforts in securing to this country a supply of the most efficacious Cod-liver Oil from Norway. I have given the necessary orders for the execution of this Medal."

**THE ROYAL POLICE OF PRUSSIA.**

"THE Royal Police of Prussia (Königliches-Polizei-Præsidium) has the honour of informing you that it has caused the sample which you have forwarded to be submitted to an official investigation, and that the result of such investigation has proved it to be not only the genuine Cod-liver Oil, but still further, that it is of a kind which distinguishes itself from the Cod-liver Oil in ordinary use, alike by its taste and chemical composition."

**"THE LANCET,"**

(July 29th, 1854)

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. IN THE PREFERENCE OF THE LIGHT-BROWN OVER THE PALE OIL WE FULLY CONCUR."

"WE HAVE CAREFULLY TESTED A SPECIMEN OF THE LIGHT-BROWN COD-LIVER OIL, PREPARED FOR MEDICAL USE UNDER THE DIRECTION OF DR. DE JONGH, AND OBTAINED FROM THE WHOLESALE AGENTS, MESSRS. ANSAR, HARFORD, AND CO., 77, STRAND. WE FIND IT TO BE GENUINE, AND RICH IN IODINE AND THE ELEMENTS OF BILE."

**"THE MEDICAL TIMES,"**

(August 5th, 1854)

"We believe that the profession are much indebted to Dr. de Jongh for his laborious researches into the composition and properties of this Oil; and we have the high authority of Baron Liebig and the late Dr. Pereira, in testimony of the value of these labours. In his zeal for investigating the properties of the Oil, Dr. de Jongh made a journey to Norway, and carefully examined its varieties, its mode of preparation, and its adulterations."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S Stamp and Signature, by

**ANSAR, HARFORD, & CO., 77, STRAND, LONDON,**

Sole Consignees and Agents for the United Kingdom and British Possessions, at the following prices:—

### THE CLASS-BOOKS USED

AT THE

METROPOLITAN SCHOOLS OF MEDICINE, SCIENCE, AND ART—SESSION 1854-5.

Price Sixpence; Stamped, Sevenpence; Gratis to Purchasers.

[Ready on Sept. 30th.]

## Highley's Scientific Educational Museum,

32, FLEET-STREET LONDON.

BONES, MICROSCOPES, TESTING-CASES, &c., MAY BE OBTAINED BY STUDENTS ON THE MOST MODERATE TERMS.

DESCRIPTIVE CATALOGUE OF  
HIGHLEY'S EDUCATIONAL COLLECTIONS  
OF SPECIMENS, APPARATUS, MODELS, &c., SELECTED FOR FACILITATING THE STUDY OF THE  
NATURAL AND MEDICAL SCIENCES, AND ART,  
*Forwarded on receipt of Two Postage Stamps.*

## MR. S. HIGHLEY'S FIRST LIST OF ANNOUNCEMENTS FOR THE SESSION 1854-5.

**NOTICE.**—MR. HIGHLEY'S PUBLICATIONS may be seen and obtained at his Agents:—Mr. Graham, Oxford; Messrs. Macmillan and Co., Cambridge; Messrs. Simms and Denham, Manchester; Mr. J. H. Bellby, Birmingham; Deighton and Loughton, Liverpool; Mr. C. Heald Thomas, Gloucester; Fletcher and Alexander, Norwich; Mr. Long, Hull; Messrs. Sutherland and Knox, Edinburgh; Mr. Hadden, Glasgow; Mr. J. A. Wilson, Aberdeen; Messrs. Hodges and Smith, Dublin. Gentlemen remote from towns may procure any work by forwarding a Post-office order for the price specified. Works above 5s. in price will be sent Carriage Free to any part of Great Britain and Ireland.

**AN ILLUSTRATED LIST OF FORTY MEDICAL AND SCIENTIFIC WORKS PUBLISHED BY SAMUEL HIGHLEY DURING THE SESSION 1853-1854.** By post, two stamps.

**COURSE OF PRACTICAL CHEMISTRY FOR THE USE OF MEDICAL STUDENTS.** Arranged with express reference to the Three Months' Summer Course. By WILLIAM ODLING, M.B., F.R.S., Professor of Practical Chemistry and of Natural Philosophy at Guy's Hospital. [On October First.]

**THE TEXT-BOOK OF CHEMICAL PHILOSOPHY.** A Familiar Exposition of the Principles of Chemistry and Physics. For the Use of Schools and Private Teachers. By JOHN HOBSLEY. Post 8vo. Numerous Woodcuts. [In the Press.]

**A POPULAR TREATISE ON THE PHYSICAL EDUCATION OF CHILDREN.** By GEORGE HAETWIG, M.D. Foolscep 8vo. Illustrations. Price 2s. 6d. [In preparation.]

**UNSOUNDNESS OF MIND IN RELATION TO CRIMINAL ACTS.** An Essay, to which the Sugden Prize of £25 was this year awarded by the King and Queen's College of Physicians of Ireland. By JOHN CHARLES BUCKNILL, M.D. Lond., Licentiate of the College of Physicians, Physician to the Devon County Lunatic Asylum. Foolscep 8vo, price 4s. 6d.

**SURGICAL AND PATHOLOGICAL OBSERVATIONS.** Part the First. By EDWIN CANTON, F.R.C.S., Assistant-Surgeon to the Charing-cross Hospital. 8vo. Illustrations.

**CLINICAL CONTRIBUTIONS TO PATHOLOGY, THERAPEUTICS, AND MIDWIFERY.** By JOHN ROSE CORMACK, M.D. Edin., F.R.S.E.

### HIGHLEY'S LIBRARY OF SCIENCE AND ART.

**PRINCIPLES OF CHEMISTRY AND PHYSICS,** as Illustrated by the Three Kingdoms of Nature. By Dr. B. PAUL, F.R.S. Numerous Illustrations.

**MANIPULATIONS IN SCIENTIFIC AND MANUFACTURING CHEMISTRY.** By C. GREVILLE WILLIAMS, Esq.

**MANUAL OF ZOO-CHEMICAL ANALYSIS,** Qualitative and Quantitative. By E. C. F. VON GORUP BESANZ, M.D., Professor of Chemistry at the University of Erlangen. Translated, with the co-operation of the Author, by J. W. SLATER. With numerous beautiful Illustrations of the Microscopical Characters of Animal Products, &c.; selected from the Works of Robin and Verdel, Funke, Donné, and Fourcault, &c. [Nearly ready.]

**THE MICROSCOPE,** in its Special Application to Vegetable Anatomy and Physiology. By Dr. HERMANN SCHACHT. Edited, with the co-operation of the Author, by FREDERIC CUREY, Esq. Second Edition, considerably enlarged. Numerous Woodcuts.

\* \* This Edition is in advance of Dr. Schacht's original Work.

**THE MICROSCOPE,** in its Special Application to Animal Anatomy and Physiology. By T. H. HUXLEY, F.R.S., &c., Lecturer in Natural History at the Department of Practical Science.

**A COURSE OF EDUCATIONAL MINERALOGY.** With numerous Diagrams.

**STUDENT'S ATLAS OF MORBID ANATOMY,** with Special Reference to DIAGNOSTIC and THERAPEUTIC. From the German of BOCK. Edited by JOHN COCKLE, A.M., M.D., Physician to the City Dispensary.

**LECTURES ON ART-ANATOMY OF THE HUMAN FORM.** By JOHN MARSHALL, F.R.C.S.E., Lecturer on Art-Anatomy at the Department of Art. With numerous Original Illustrations.

**A MANUAL OF PRACTICAL PHOTOGRAPHY.** With numerous Illustrations. [In the Press.]

**PHOTOGRAPHY** in its APPLICATION to SCIENCE:—I. INTRODUCTION to the SERIES.—II. Photography in its Application to Medical Science: PHYSIOGNOMY of the TYPES of INSANITY. A Series of Photographs from the Life. With brief Medical Notes. By Dr. HUGH DIAMOND, F.S.A.—III. Photography in its Application to Surgery: A STEREOSCOPIC PHOTOGRAPHIC ATLAS of SURGICAL ANATOMY.—IV. Photography in its Application to Optics: AN ATLAS of MICROSCOPICAL PHOTOGRAPHS. By JOSEPH DELVES, Esq.—PHOTOGRAPHIC ILLUSTRATIONS of OPTICAL PHENOMENA.—V. Photography in its Applications to Natural History: PHOTOGRAPHS of the RARE FOSSILS.

CHEMISTRY AND NATURAL PHILOSOPHY TEXT-BOOKS.

**Liebig's Handbook of Organic ANALYSIS.** Edited by Dr. HOFMANN. Large 12mo, with eighty-five Illustrations, 5s., cloth.

**WOHLER'S HANDBOOK OF INORGANIC ANALYSIS.** Edited by Dr. HOFMANN. Large 12mo, 6s. 6d., cloth.

**GREGORY'S HANDBOOK OF INORGANIC CHEMISTRY.** For the use of Students. Large 12mo, with Illustrations, 5s. 6d., cloth.

**GREGORY'S HANDBOOK OF ORGANIC CHEMISTRY.** For the use of Students. Large 12mo, 9s. 6d., cloth.

**LARDNER'S HANDBOOK OF NATURAL PHILOSOPHY AND ASTRONOMY.**

**FIRST COURSE.**—Mechanics—Hydrostatics—Hydraulics—Pneumatics—Sound—Optics. With 400 Woodcuts. Large 12mo, cloth, 12s. 6d.

**SECOND COURSE.**—Heat—Common Electricity—Magnetism—Voltaic Electricity. With 200 Woodcuts. Large 12mo, cloth, 8s. 6d.

**THIRD COURSE.**—Astronomy and Meteorology. With many Illustrations. Large 12mo, 16s. 6d.

**LIEBIG'S FAMILIAR LETTERS ON CHEMISTRY:** in its Relations to Physiology, Dietetics, Agriculture, Commerce, and Political Economy. Cheap Edition. One vol. fcap. 8vo, price 6s., cloth.

**LIEBIG'S AGRICULTURAL CHEMISTRY.** Fourth Edition, revised. 8vo, 6s. 6d., cloth.

**LIEBIG'S ANIMAL CHEMISTRY; OR, CHEMISTRY in its APPLICATIONS to PHYSIOLOGY and PATHOLOGY.** Third Edition. 8vo. Part I., 6s. 6d., cloth.

**MOHR AND REDWOOD'S PRACTICAL PHARMACY.** 8vo, 400 Cuts, 6s. 6d.

**PARNELL'S CHEMICAL ANALYSIS.** Second Edition. 8vo, 9s.

**WILL'S GIESSEN OUTLINES OF ANALYSIS.** 8vo, 6s.

London: WALTON and MABERLY, Booksellers and Publishers to University College, 28 Inner Gower-street and 27, Ivy-lane.

CHEAP AND LIMITED ISSUE OF

**Quain and Wilson's Anatomical PLATES.**—In November will be ready for delivery, SUBSCRIBERS' COPIES of this Work, at the following low prices—viz.,

To Subscribers. Former Price.

THE COMPLETE WORK, in Two volumes, Royal Folio, Half-bound Morocco ... £5 5 0 £8 8 0

THE SAME, FULL COLOURED, Half-bound Morocco ... 8 8 0 14 0 0

The Work may also be subscribed for in separate portions, bound in Cloth and Lettered, as follows:—

	PLAIN.		COLOURED.	
	To Subscribers.	Former Price.	To Subscribers.	Former Price.
MUSCLES, 51 Plates ...	£1 5 0	£1 18 0	£2 4 0	£3 12 0
VERTEBRÆ, 50 Plates ...	1 5 0	1 18 0	2 0 0	3 3 0
NERVES, 38 Plates ...	1 1 0	1 10 0	1 14 0	2 16 0

BONES and LIGAMENTS, 90 Plates ...	0 17 0	1 5 0	1 0 0	1 11 0

\* Proposals, with full particulars, may be had of the Publishers, by whom and by all Booksellers, Subscribers' names will be received.

London: Walton and Maberly, 23, Upper Gower-street, and 27, Ivy-lane, Paternoster-row.

TO THE MEDICAL PROFESSION.

**Messrs. Hughes and Butler have**

always on Sale a large collection of Standard and Elementary Works, to which they respectfully invite the attention of the Medical Profession.

Gentlemen pursuing their professional studies at the hospitals of this metropolis will be able to procure all the elementary works which they may require, at the shortest notice, and on the most liberal terms.

Physicians, surgeons, and general practitioners will find here a large collection of standard works, by the most eminent men, on Anatomy, Physiology, Pathology, Therapeutics, and Surgery.

Chemists and druggists, also, will find here a very excellent selection of the various scientific and other works they may require, including Pharmacy, Chemistry, Mineralogy, Botany, Natural History, &c.

Messrs. Hughes and Butler also take this opportunity of informing their Medical friends, that they always have on hand a large stock of Works on every department of general literature.

Messrs. Hughes and Butler continue to keep on hand a most extensive Collection of Ancient and Modern WELSH LITERATURE, to which they invite the attention of their Welsh friends.

London: 15, St. Martin's-le-Grand, City, opposite the General Post-Office.

Now ready, price 5s. 6d., or, free, by post, to any part of the United Kingdom, price 6s., Fourth Edition, greatly enlarged and improved,

**A Grammatical Introduction to the**

LONDON PHARMACOPŒIA, and a KEY to PHYSICIANS' PRESCRIPTIONS. By S. F. LEACH.

"This little work will be found extremely useful to students who have received but an imperfect classical education."—THE LANCET.

Hughes and Butler, Medical Booksellers and Publishers, 15, St. Martin's-le-Grand.

WILL BE PUBLISHED ON THE 1st OF JANUARY, 1855,

Price 6s., (including 1s. Postage), handsomely bound in green and gold,

THE BRITISH MEDICAL DIRECTORY.

CONTAINING

A List of the Names, Addresses, Qualifications, and Public Appointments of the Legally-Qualified Medical Practitioners in England, Scotland, and Wales; with the dates of their Qualifications, the names of the medical and other scientific institutions to which they respectively belong, and the titles of their published works and contributions to science and general literature; together with a great variety of information, useful to the Medical Profession, Club-Houses, Libraries, Reading-Rooms, Hospitals, and all public Institutions.

LONDON: PUBLISHED AT THE OFFICE, 423, STRAND.

Orders received by all Booksellers and News-vendors in the United Kingdom.

NEW CHEMICAL DICTIONARY.

Now ready, in One Volume, 8vo, price 12s. 6d.

**Cyclopædia of Chemistry, with its**

Applications to MINERALOGY, PHYSIOLOGY, and the ARTS. By ROBERT D. THOMSON, M.D., F.R.S., Professor of Chemistry at St. Thomas's Hospital College.

"In every respect worthy of praise. It is within a limited space, by far the best compendium of chemistry which we have yet seen."—THE LANCET.

London and Glasgow: Richard Griffin and Co.

Just Published, in 8vo, 40 pages, price 1s.

**Observations on the Nature and**

TREATMENT OF ASIATIC CHOLERA. By JAMES TUCKER, M.D.

Lately published, 8vo, cloth, 10s. 6d.

**OBSERVATIONS ON THE NATURE AND TREATMENT OF ASIATIC CHOLERA.** By WILLIAM STEVENS, M.D.

W. Baillière, 219, Regent-street, and 280, Broadway, New York.

WORKS ON ANATOMY,

PUBLISHED BY H. BAILLIÈRE, 219, REGENT-STREET, LONDON; AND 280, BROADWAY, NEW YORK.

**Cruveilhier and Bonamy.—Atlas of**

the Descriptive Anatomy of the Human Body. By J. CRUVEILHIER, Professor of Anatomy to the Faculty of Medicine, Paris. With Explanations by C. BONAMY. Containing 82 Plates of Osteology, Syndemology, and Myology. 4to. Plain, £3; coloured, £5 15s.

**FAU.—The Anatomy of the External Forms of Man, (for Artists.)** Edited by R. KNOX, M.D. With Additions. 8vo. Text, and 28 4to Plates. Plain, £1 4s.; coloured, £2 2s.

**GERBER and GULLIVER.—Elements of the General and Microscopical Anatomy of Man and the Mammalia;** chiefly after Original Researches. To which is added an Appendix, comprising Researches on the Anatomy of the Blood, Chyle, Lymph, Thymus Fluid, Tubercle, and Additions by C. GULLIVER, F.R.S. Text, and an Atlas of 34 Plates. 2 vols. 8vo, cloth boards, £1 4s.

**GRANT.—General View of the Distribution of Extinct Animals.** 18mo. 1839. 3s. 6d.

— On the Principles of Classification, as applied to the Primary Divisions of the Animal Kingdom. 18mo. With 28 Woodcuts. 1839. 3s. 6d.

— Outlines of Comparative Anatomy. 8vo. With 148 Woodcuts. Boards, £1 8s.

**QUEKETT (J.).—Lectures on Histology, delivered at the Royal College of Surgeons of England. Elementary Tissues of Plants and Animals; Structure of the Skeleton of Plants and Invertebrate Animals.** Illustrated with 423 Woodcuts. 2 vols. 8vo. 1852-54. £1 8s. 6d.

— Practical Treatise on the Use of the Microscope. Illustrated with 12 Steel Plates and Wood Engravings. 2nd Edition, 8vo, £1 2s.

— Practical Treatise on Minute Injection, and the Application of the Microscope to Diseased Structure. 8vo. Illustrated.

**LEE.—The Anatomy of the Nerves of the Uterus.** Folio. With 2 engraved Plates, 8s.

**MOREAU (Professor).—Icones Obstetricæ; a Series of 60 Plates and Text, Illustrative of the Art and Science of Midwifery in all its Branches.** Edited, with Practical Remarks, by J. S. STREETER, M.R.C.S. Folio, cloth boards. Plain, £3 3s.; coloured, £6 6s.

**OWEN.—Odontography; or, a Treatise on the Comparative Anatomy of the Teeth, their Physiological Relations, Mode of Development, and Microscopical Structure in the Vertebrate Animals.** 2 vols. royal 8vo, containing 168 Plates, half-bound russet, £6 6s.

— A few copies of the Plates have been printed on India paper. 2 vols. 4to, £10 10s.

**VOGEL and DAY.—The Pathological Anatomy of the Human Body.** From the German, with Additions, by GEORGE E. DAY, M.D., Professor to the University of St. Andrews. Illustrated with upwards of 100 plain and coloured Engravings. 8vo, cloth, 18s.

\* A New Foreign Scientific Catalogue, Now Ready, gratis on application, or per post, 2d.

JUST PUBLISHED.

# Graves' Clinical Lectures on the

PRACTICE OF MEDICINE. Second Edition, with many Improvements. Edited by Dr. NELIGAN. Two Vols. 8vo, cloth lettered, price 24s. "The practitioner will often find here, when at a loss, some valuable hints to assist him in the treatment of a difficult and troublesome case."—THE LANCET.

"These volumes will be found most valuable for reference."—LONDON MEDICAL GAZETTE.

"We are bound to offer our unqualified approbation to this very useful work."—LITERARY GAZETTE.

"No practitioner of medicine should be without it, since there is scarcely a disease to which the human frame is liable which does not receive in it some illustration, direct or incidental; and as a guide to practice, especially when difficulties arise, it will be found a most useful work for reference."—BRITISH AND FOREIGN MEDICAL REVIEW.

## NELIGAN ON DISEASES OF THE SKIN. One Vol.

post 8vo, cloth lettered, price 9s. 6d.

"This work will be found a valuable addition to the library of the practitioner."—MEDICAL TIMES AND GAZETTE.

"It is practical in its descriptions, in its diagnosis, and in its treatment; it bears the marks of great care and extensive observation, and its style is simple, clear, and condensed."—DUBLIN MEDICAL PRESS.

"For consultation, and a ready reference to the best practice in any of the known forms of disease to which the skin is incident, it is a valuable book."—BRITISH MEDICAL AND SURGICAL JOURNAL.

## ORR'S PRINCIPLES OF SURGERY. One Vol. fcap. 8vo, cloth lettered, price 10s. 6d.

"We are confident of the success of Mr. Orr's Principles of Surgery."—THE LANCET.

"The highest praise we can bestow on the work is to say—it is the record of the opinions of an able surgeon."—MEDICAL TIMES.

"It cannot fail of proving an acceptable boon to both the student and practitioner."—DUBLIN MEDICAL PRESS.

## LEDWICH'S PRACTICAL AND DESCRIPTIVE ANATOMY. One Vol. post 8vo, pp. 920. Cloth lettered, price 12s. 6d.

"It is evidently written directly from observations made in the dissecting room, and is, therefore, peculiarly adapted as a handbook for the student who seeks his information in the only way in which it can be correctly obtained—from the dead body itself."—DUBLIN QUARTERLY JOURNAL OF MEDICAL SCIENCE.

"The author's task has been performed ably, clearly, and systematically. The work will be found useful to the dissector, be he an old or a young student."—THE LANCET.

## POWER'S EDITION OF FLOOD ON THE SURGICAL ANATOMY OF THE ARTERIES. Fcap. 8vo, cloth, 6s.

"A really standard book, and we are glad to see this edition carefully edited and enlarged, as it is by Dr. Power. The work is concise, clear, and simple."—THE LANCET.

## NELIGAN'S ATLAS OF COLOURED DRAWINGS OF CUTANEOUS ERUPTIONS, to consist of Sixteen Plates, small folio, containing nearly One Hundred Delineations. [Nearly ready.]

NELIGAN'S MEDICINES, THEIR USES AND MODE OF ADMINISTRATION. Fourth Edition. One Vol. 8vo, cloth, price 15s. Besides numerous and important additions, the entire work has been thoroughly revised, and all the formulae contained in the three British Pharmacopoeias are now, for the first time, given at length.

## MAUNSELL AND EVANSON ON THE DISEASES AND MANAGEMENT OF CHILDREN. Fifth Edition. One Vol. 8vo, cloth lettered, price 12s. 6d.

"It will be found useful by all who have to grapple with the difficulties of Practice."—LONDON MEDICAL GAZETTE.

"The chapters on the management and physical education of children ought to be printed in letters of gold, and hung up in the nursery of every family."—MEDICO-CHIRURGICAL REVIEW.

## CHURCHILL ON THE DISEASES OF WOMEN, INCLUDING THOSE OF PREGNANCY AND CHILDBED. Third Edition. One Vol. fcap. 8vo, cloth lettered, price 12s. 6d.

"A work like the present has long been a desideratum in our medical literature, both for practitioners and for the student."—BRITISH AND FOREIGN MEDICAL REVIEW.

"It has the testimony of our unqualified approbation. It surpasses any other that has ever issued on the same subject from the British press."—DUBLIN MEDICAL JOURNAL.

"We can conscientiously recommend Dr. Churchill as a safe and useful guide."—LONDON MEDICAL GAZETTE.

"A standard work of reference for the accoucheur and general practitioner."—EDINBURGH MEDICAL AND SURGICAL JOURNAL.

## MITCHELL ON THE USE OF THE SPECULUM IN THE TREATMENT OF DISEASES OF FEMALES. One Vol., 12mo, coloured plates, cloth lettered, price 4s. 6d.

"Both pupils and practitioners will read this little practical work with advantage."—THE LANCET.

"It contains more useful practical information than some treatises of double or treble the size."—DUBLIN MEDICAL PRESS.

"It has rarely been our lot to find so much useful matter in so limited a number of pages; indeed, there is no page of the volume but may be read with infinite advantage by the experienced practitioner."—BRITISH RECORD OF OBSTETRIC MEDICINE.

## CORRIGAN ON THE NATURE AND TREATMENT OF FEVER: with Clinical Illustrations. Post 8vo, cloth, 4s. 6d.

"We must be permitted to express the gratification we feel at the publication of another of those valuable practical works for which the Irish School of Medicine has become so celebrated, and to tell our readers that, in Dr. Corrigan's Lectures on Fever, they will find a collection of anabisms, a knowledge of which will relieve them from many a difficulty at the bedside of their patient."—DUBLIN JOURNAL OF MEDICAL SCIENCE.

Dublin: Fennin and Co. London: Longman and Co. Edinburgh: Macleachlan and Stewart.

Now ready, in fcap. 8vo, cloth, price 12s. 6d.

# Hooper's Physician's Vade-Mecum;

or, a Manual of the Principles and Practice of Physic; Fourth Edition, much enlarged and improved, by Dr. GUY, of King's College.

London: Henry Benbow: Whittaker and Co.; Simpkin and Co.; J. Churchill; S. Highley; Houlston and Co. Edinburgh: A. and C. Black; Macleachlan and Co. Dublin: Fennin and Co.

Now ready, Sixth Edition, foolscap, cloth, price 12s. 6d.

# Druitt's Surgeon's Vade-Mecum.

A Manual of Modern Surgery. The Sixth Edition, re-written, enlarged, much improved, and illustrated by 300 Wood Engravings.

London: Henry Benbow, 354, Strand; and John Churchill, New Burlington-street.

Just published, 8vo, cloth, 8s.

# On the Diseases, Injuries, and

MALFORMATIONS OF THE RECTUM AND ANUS.

By T. J. ASHTON, Surgeon to the Blenheim-street Dispensary; formerly House-Surgeon at University College Hospital.

"We find in it more information than is to be obtained from any single volume yet published on the subject of which it treats."—THE LANCET.

"It may be consulted with much advantage by those who are engaged in the treatment of diseases of the rectum and anus."—ASSOCIATION MEDICAL JOURNAL.

London: John Churchill, New Burlington-street.

## JACKSONIAN PRIZE TREATISE OF THE ROYAL COLLEGE OF SURGEONS.

Just published, with Plates, cloth, 8vo, 10s.

# Stricture of the Urethra, its Pathology and Treatment.

By HENRY THOMPSON, F.R.C.S., M.B., Surgeon to the Marylebone Infirmary, &c.

"Mr. Thompson deserves no small credit for the dispassionate manner in which he has executed his task, and for the calm discriminating judgment displayed in appreciating the various methods of treatment. The book is calculated to be most useful to the profession, and to reflect great credit on Mr. Thompson, both as an author and as a practical surgeon."—EDINBURGH MONTHLY JOURNAL.

"We now take leave of Mr. Thompson's treatise, and we cannot better express our approval of it than by stating that, for accuracy, perspicuity, and methodical arrangement of the different departments of the subject, it surpasses any on the pathology and treatment of stricture which we have ever perused. \* \* \* Added to the work is an appendix of many pages, containing most excellent instruction, both pathological and practical."—DUBLIN QUARTERLY JOURNAL.

"Mr. Thompson has given the profession by far the most complete treatise on urethral strictures that it possesses, and has produced a monograph that, for laborious pathological research and originality of investigation, does him infinite credit, and establishes his character as one of the ablest pathologists of the day in that department of surgical practice which he has undertaken to elucidate. It is a work that ought to be in the library of every surgeon."—THE LANCET.

"An elaborate essay, embracing all points connected with the important disease in question."—MEDICAL TIMES.

"We cordially recommend to our readers the monograph before us as the most comprehensive, accurate, and practical treatise on the whole subject of urethral stricture and its consequences, which has yet been presented to the profession. It will naturally become the text-book to this important department of urinary pathology."—LANCET'S ABSTRACT.

"An excellent summary of all that is known relating to stricture of the urethra and its treatment."—ASSOCIATION JOURNAL.

"Un ouvrage vraiment à part pour la valeur et le nombre des documents originaux sur lesquels ses conclusions se trouvent appuyées."—GAZ. HEBDOM. DE PARIS.

London: John Churchill, New Burlington-street.

## MEDICAL WORKS.

I.

The Eleventh Edition, complete, of the late

# Dr. Gregory's Conspectus Medicinæ

THEORETICÆ, carefully revised and compared with the Edition last corrected by the Author, with the Punctuation improved, so as greatly to facilitate Translation. 12mo, 7s.

II.

## GREGORY'S CONSPECTUS OF MEDICINE, in ENGLISH.

Translated from the Original Latin, and carefully Revised throughout. 12mo, cloth, 6s.

III.

## OUTLINES OF PHYSIOLOGY, ANATOMY, and SURGERY, for the Use of Students in Medicine. By WILLIAM WILKINSON, M.D. 18mo, cloth, 6s.

IV.

TREATISE on the OLEUM JECORIS ASELLI; or, COD-LIVER OIL, (with an APPENDIX,) as a THERAPEUTIC AGENT in CERTAIN FORMS OF GOUT, RHEUMATISM, and SCROFULA. By Professor BENNETT. 8vo, cloth, 4s.

V.

PATHOLOGICAL and PRACTICAL RESEARCHES on DISEASES OF THE BRAIN and SPINAL CORD. By JOHN ABERCROMBIE, M.D. 18mo, cloth, 6s.

VI.

OBSERVATIONS on the SITE and CONSTRUCTION of HOSPITALS. By Sir GEORGE BALLINGALL, M.D., F.R.S.E. With a Lithographed Engraving. 4to, stitched, 2s. 6d.

Edinburgh, Macleachlan and Stewart; London, Simpkin, Marshall, and Co.; Houlston and Stoneman; H. Washbourne; Longman, Brown, and Co.; James Cornish.

Now ready, in fcap. 8vo, with Woodcuts, price 7s.

**Lectures on Polarized Light, together with a LECTURE on the MICROSCOPE,** delivered before the Pharmaceutical Society of Great Britain, and at the Medical School of the London Hospital. By the late JONATHAN PEREIRA, M.D., F.R.S., &c. Second Edition, greatly enlarged from Materials left by the Author. Edited by the Rev. BADEN POWELL, M.A., V.P.R.S.

London: Longman, Brown, Green, and Longmans.

BY AUTHORITY OF THE REGISTRAR-GENERAL.

Now ready, in royal 8vo, price 5s.

## The Census of Great Britain in 1851.

Comprising an Account of the Numbers and Distribution of the People; their Ages, Conjugal Condition, Occupations, and Birth-place; with Returns of the Blind, the Deaf and Dumb, and the Inmates of Public Institutions; and an Analytical Index. Reprinted, in a condensed form, from the Official Reports and Tables.

London: Longman, Brown, Green, and Longmans.

### DISEASES OF THE KIDNEY.

Lately published, in 8vo, price 6s.

## On the Nature and Treatment of

DISEASES OF THE KIDNEY connected with Albuminous Urine (Morbus Brightii). By GEORGE OWEN REES, M.D., F.R.S.; one of the Examiners in the University of London; Assistant Physician to and Lecturer on Materia Medica at Guy's Hospital; Author of "The Analysis and Treatment of Urinary Diseases."

London: Longman, Brown, Green, and Longmans.

Just published, price 6s., illustrated with numerous Engravings on Wood.

## The Eye in Health and Disease.

With a description of the Optometer, for the adaptation of Spectacles, for Impaired, Defective, or Aged Sight. Being the substance of Lectures delivered at the Central London Ophthalmic Hospital. By ALFRED SMEE, F.R.S., Surgeon to the Bank of England, Surgeon to the Central London Ophthalmic Hospital, &c. Second Edition; to which is added a Paper on the Stereoscope and Binocular Perspective.

Longman and Co., Paternoster-row; Horne, Thornthwaite, and Wood, 123, Newgate-street.

Eighth Edition, in One Volume, 8vo, cloth, £1 10s.

## Turner's Elements of Chemistry.

Edited by Professors LIEBIG and GREGORY.

Part I.—INORGANIC CHEMISTRY, 16s. cloth.

Part II.—ORGANIC CHEMISTRY, 15s. cloth.

"The present is, in short, the most complete and the most luminous system of chemistry in the English language; and we know not one in France or Germany that comes near it."—EDINBURGH MEDICAL AND SURGICAL JOURNAL, January 1st, 1847.

Taylor and Walton, Upper Gower-street, London; MacLachlan and Stewart, Edinburgh; William Mackenzie, 45 and 47, Howard-street, Glasgow.

### STANDARD MEDICAL WORKS.

## A Treatise on the Diseases of the

HEART and AORTA. By WM. STOKES, M.D., M.R.I.A., &c. One vol. 8vo, cloth, 18s.

**THE DUBLIN DISSECTOR, or SYSTEM of PRACTICAL ANATOMY.** Comprising a Concise Description of the Bones, Muscles, Vessels, Nerves, and Viscera; also the Relative Anatomy of the different Regions of the Human Body; for the Use of Students in the Dissecting Room. By ROBERT HARRISON, M.D., V.P.R.C.S.I., M.R.I.A., &c. Illustrated by 160 Engravings on Wood. Fifth Edition. Two vols. fcap. 8vo, price 15s.

**ELEMENTS OF CHEMISTRY, Practical and Theoretical,** including the most recent Discoveries and Applications of the Science to Medicine and Pharmacy, to Agriculture, and to Manufactures. Second Edition, revised and enlarged, with 230 Illustrations on Wood. By Sir ROBERT KANE, M.D., M.R.I.A., Director of the Museum of Irish Industry; President of the Queen's College, Cork, &c. &c. One vol. 8vo, 28s.

**THE SURGICAL ANATOMY OF THE ARTERIES OF THE HUMAN BODY.** By ROBERT HARRISON, M.D., V.P.R.C.S.I., &c., Author of the "Dublin Dissector." Fourth Edition. One vol. 12mo, cloth, 9s.

**A TREATISE ON FRACTURES IN THE VICINITY OF JOINTS,** and on certain Forms of Accidental and Congenital Dislocations. By ROBERT WILLIAM SMITH, M.D., M.R.I.A., Fellow of the Royal College of Surgeons in Ireland. One vol. 8vo, boards, illustrated with 200 Engravings on Wood, 16s.

**PRACTICAL OBSERVATIONS ON MIDWIFERY,** and the Diseases Incidental to the Puerperal State, embodying a Clinical Report of the Dublin Lying-in Hospital for the years 1842, 1843, and 1844, during which period 6834 Women were delivered in the Institution. Published with the permission of the Master. By ALFRED H. MCCLINTOCK, M.D., F.R.C.S.I., and SAMUEL LITTLE HARDY, M.D., F.R.C.S.I. One vol. 8vo, cloth, price 10s. 6d.

**NEUROMA: a Treatise upon the Pathology, Diagnosis, and Treatment.** By ROBERT W. SMITH, M.D., T.C.D., M.R.I.A., F.R.C.S.I., Professor of Surgery in the University of Dublin; Fellow of the Royal Medical and Chirurgical Society of London; Author of "A Treatise on Fractures in the Vicinity of Joints," &c. One vol. imperial folio, with Plates drawn from Nature. Price, India paper, £4 4s.; plain, £3 3s.

Dublin: Hodges and Smith, Grafton-street. London: Simpkin, Marshall, and Co. Edinburgh: MacLachlan and Stewart.

Just published, price 5s., demy 8vo, Third Edition, greatly enlarged.

## Practical Observations on the Treat-

MENT OF STRICTURE OF THE URETHRA AND FISTULA IN PERINEO, illustrated with Additional Cases and New Drawings of these Affections; with a Copious Appendix, containing the Opinions of the most eminent London Surgeons and others, on the Perineal Section, showing that the operation has proved fatal in Edinburgh and London. By JOHN LIZARS, late Professor of Surgery to the Royal College of Surgeons, and Senior Operating Surgeon to the Royal Infirmary of Edinburgh.

W. H. Lizars, Edinburgh; and S. Highley, junr., London.

Extract from Medical Times and Gazette of 7th January, 1854.

"The third edition of a work already well known to the profession, in which the method of treatment by perineal section has been made the chief matter for discussion.....Mr. Lizars has brought forward several additional facts, which show that the operation in question has not been attended with such good results as Mr. Syme would lead us to suppose. No less than ten cases are related where the perineal section had been followed by more or less untoward results—had failed in preventing the return of the disease, or had induced complications which rendered the patients worse than they were before the operations were performed. Of the results of some of these cases, Mr. Lizars has given pictorial illustrations of a somewhat extraordinary and amusing character.....According to Mr. Lizars, profuse hemorrhage, return of the stricture, perineal fistula, and death, have been, in a considerable number of cases, the consequences of this operation.....The statements of Mr. Lizars serve to corroborate the opinion which generally prevails, that the perineal section, in cases of permeable stricture, is an unsafe proceeding—one which does not promise to be effectual, and therefore unjustifiable."

### ILLUSTRATED POPULAR EDUCATIONAL WORKS.

## Webster's Dictionary of the English

LANGUAGE, exhibiting the Origin, Orthography, Pronunciation, and Definition of Words; comprising, also, a Synopsis of Words variously Pronounced by different Orthoepists; and Walker's Key to the Classical Pronunciation of Greek, Latin, and Scripture Proper Names. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

## Scientific Professional Apparatus,

manufactured and sold by HORNE, THORNTWHAITE, and WOOD, 121 and 123, Newgate-street, London, who invite attention to the following articles, which have given universal satisfaction:—

MEDICAL ACHROMATIC MICROSCOPES, in Case, for Anatomical Urinary Deposits, &c., £2 10s., £5 5s., and upwards.

ELECTRO-GALVANIC MACHINES, giving a uniform current of galvanism of great quantity, and of the only form and construction suitable for Medical Application, in portable Case, £3 3s., £5 5s., and £8 8s.

URINOMETERS, gilt metal, 14s.; glass, 4s. 6d. In Case, for pocket, with Thermometer, Acid, &c., 21s. and 35s.

APPARATUS and TESTS for ANALYSES of URINE and TOXICOLOGY In Cases, £3 3s., £5 5s., and £10 10s.

\* Any required information and price-lists forwarded on application.

TO THE SURGICAL AND MEDICAL PROFESSION.

## W. F. Duroch, late Smith, begs to

inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas's-street, (near the Hospital,) in Southwark.

Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.

SPECULUM ANI, made by W. Duroch, for John Hilton, Esq., may be had at a moderate price.

**For Superior Bedding and Fashion-**  
able Bedsteads, in Wood and Metals, visit DRUCE and CO'S celebrated  
SHOW-ROOMS and FACTORY, 68, 69, and 53, Baker-street, and 3, 4, and 5,  
King-street, Portman-square. The Prices are marked in plain figures, and a  
written warranty given.

**The 16s. Trousers reduced to 14s.—**  
Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s.,  
made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant  
Tailor, 74, Regent-street.—A perfect fit guaranteed.

**To all who cannot get a Fit; the**  
Importance of which requires no elucidation to convince the most  
sceptical how indispensably necessary it is to health, comfort, and appearance.  
R. T. PIGRAM, while wishing to avoid the present system of puffing, adopts  
this means of making known his SELF-ACTING INDICATOR of the HUMAN  
FIGURE. An invention can only be estimated by its results: a trial will not  
only give satisfaction, but will justify in favouring R. T. P. with their recom-  
mendation.

R. T. Pigram, Tailor, 51, Lamb's Conduit-street, Foundling Hospital.

**Assistant-Surgeons.—Gentlemen**  
receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s  
Service, can obtain every requisite for a complete Outfit, made with due regard  
to comfort, elegance, durability, and correctness of regulation, at a great re-  
duction from the usual charges, at

L. PHILLIPS, 23, WEST STRAND, LONDON,  
the oldest established Naval and Military Outfitting Warehouse in the United  
Kingdom. Patronised by the Lords of the Admiralty and the principal  
Medical Officers of the three Services. Detailed lists of the articles required  
on taking up a Commission, with prices affixed, on application.

**Gold Chains and Jewellery.—**  
WATHERSTON and BROGDEN'S GOLD CHAINS, by troy weight,  
at realizable value, and the workmanship at wholesale manufacturers' prices.

EXAMPLE.

Intrinsic value of a chain of 15 carat gold, weighing 1½ oz. ... £3 19 7  
Supposing the workmanship to be ... .. 2 0 0

Total ... .. 5 19 7

By this arrangement the public will see at a glance the proportion charged  
for labour compared with the *bullion* in a gold chain, and being always able  
to realize the one, will have only to decide on the value of the other. An exten-  
sive assortment of jewellery, of the first quality, all made at their manufactory,  
16, Henrietta-street, Covent-garden, London.

Established A.D. 1798.

**Patent Perambulators.**  
C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her  
Majesty by Appointment.

The distinguished patronage, the flattering encomiums, and the increasing  
demand, are sufficient proofs of the utility and excellence of these fashionable,  
safe, and elegant Carriages for adults, children, and invalids, propelled from  
behind by the slightest effort. Country and Shipping orders. Illustrated  
Circulars.

OFFICE, 497, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION.  
Price Two Guineas.

CAUTION.—To avoid unprincipled and dangerous imitations, look for  
Burton's Label on each Carriage.

DOUBLE PATENT.

**Briet's portable Gazogène,**  
OR SODA-WATER APPARATUS,

for the immediate production of Soda-water, Ginger-  
beer, sparkling Wine, Lemonade, &c. &c.

SPECIAL POWDERS for generating Gas in the  
same, cheaper and more effective than any other  
preparation.

SELTZER POWDERS, prepared from a recent  
analysis of the fresh water from the spring by a ce-  
lebrated German chemist.

PATENT REFRIGERATOR, or Gazogène-Cooler.

PATENT PORTABLE FILTER, a cheap and  
useful article, not occupying more than four to six  
inches in space, and filtering from six to ten gallons  
per twenty-four hours, suitable for Military, Navy, and  
Travellers in all Climates.

Sole Wholesale Agents, GEBHARDT, ROTTMANN  
and Co., 21, Bartlett's-buildings, Holborn, London.

NOTICE is hereby given, that proceedings will be  
adopted against all parties selling or exposing for sale  
the imitations of the above-named articles, as the said  
imitations are infringements upon these patents.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.  
**Important Saving, by Pre-payment,**  
in the PURCHASE of

NEW WHITE MOULDED VIALS.

APSLEY PELLATT and CO. submit the following PRICES of VIALS, for  
PRE-PAYMENT only:—

½ oz., 1 oz., & 1½ oz. per Gross, 6s.	
2 oz. " 7s.	
3 oz. " 8s.	
4 oz. " 10s.	
6 oz. " 15s.	
8 oz. " 18s.	
4½ oz. graduated in 3 doses 12s. 6d.	

In quantities of not less than  
Six Gross, assorted to suit the con-  
venience of the purchaser, de-  
livered to carriers in London.  
No charge for Package.  
Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes *all charges*  
whatever between the Manufacturer and the Consumer, no attention can be  
paid to any order not accompanied by a remittance in full, made payable in  
London.—Orders and remittances to be addressed,

APSLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

**Major's Remedies for the Horse,**  
the best and most effectual ever discovered, superseding the "burning  
iron" and the torture of the "cautery."

MAJOR'S BRITISH REMEDY, for the cure of ringbone, spavins, splints  
&c. A single bottle sufficient to cure from four to six spavins, £1 15s.

MAJOR'S SYNOVITIC LOTION, (the Remedy, No. 2.) for grogginess,  
weak joints, sprains of the back sinews, ruptures of the sheaths of tendons,  
suspensory ligaments, shoulder lameness, and inflammation; also for the cure  
and prevention of breaking down, &c.—In bottles, large size, £1 1s.; small,  
10s. 6d. each. The above invaluable remedies can now be forwarded to any  
part of the United Kingdom. Pre-payment by check or post-office order,  
made payable to Joseph Major, Post Office, Charing-cross.

JOSEPH MAJOR, Horse Infirmary, British-yard, Cockspur-street,  
Charing-cross.

**Cotyledon Umbilicus.—Epilepsy**

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS,  
(vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations  
specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.  
Insipissated Juice. Dose, half a drachm to a drachm; 16s. per lb.  
Solid Extract. Dose, five to fifteen grains; 20s. per lb.  
Taraxacum (Davenport's Liquor, or Fluid Extract, prepared by Spontaneous  
Insipissation, possesses every characteristic of the Fresh Juice, and has proved  
highly efficacious where the ordinary Extracts have proved inert. Dose, a  
liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge,  
33, Great Russell-street, Bloomsbury.

IMPORTANT TO THE MEDICAL PROFESSION.

**Davenport's Syrup of the Iodide of**  
QUININE AND IRON.

FROM DR. GOLDING BIRD.

"43, Russell-square.

"I have now for some time employed pretty largely the triple Compound  
of Iodine, Quinine, and Iron, prepared by Mr. John T. Davenport, in the  
form of Syrup. I do not hesitate to express my opinion of its great value  
as a therapeutic agent. It has appeared to me that the Quinine assisted  
the assimilation of the Iron, and I have found it to be of very great value  
in cases in which the use of the Iodide of Iron is recognised. This triple  
Compound possesses many advantages over the simple Iodide, and not the  
least of them is the satisfactory manner in which it is tolerated by the  
stomach, especially if administered (as all preparations of Iron ought to be)  
immediately after a meal.

"GOLDING BIRD, A.M., M.D., F.R.S.,

"Fellow of the Royal College of Physicians,

"Physician and Professor of Materia Medica, at Guy's."

FROM DR. GEORGE P. MAY.

"Having for some time past extensively used the ternary Compound of  
Quinine, Iodine, and Iron, prepared by Mr. J. T. Davenport, I can with  
confidence testify to its marked efficacy in cases of Struma and Anemia,  
and, indeed, in all instances in which the exhibition of Iron and its Com-  
pounds is indicated. This preparation appears to combine all the thera-  
pentic powers of its constituents, without their nauseous qualities, which  
renders it an admirable medicine in the treatment of some of the disorders of  
Childhood.

"GEO. P. MAY, M.D."

SYRUP OF THE IODIDE OF ZINC, as prepared for Dr. Barlow, of  
Guy's Hospital.

TARAXACUM (Davenport's) LIQUOR, or FLUID EXTRACT, prepared  
by Spontaneous Insipissation, possesses every characteristic of the Fresh  
Juice, and has proved highly efficacious where the ordinary Extracts have  
proved inert. Dose, a liquid drachm. 6s. per lb.

CITRATE OF QUININE AND IRON, 25 per cent. of Quinine. 4s. 6d.  
per oz.

SYRUP OF THE IODIDE OF IRON (P.L.), 3s. per lb.

BI-MECONITE SOLUTION OF OPIUM. Professional testimonials  
acknowledge this preparation to be the most efficient sedative extant. The  
unpleasant effects of ordinary opiates are entirely obviated. Dose, 15 to 30  
Drops. 8d. per oz.

COTYLEDON UMBILICUS. The Solid and Fluid Extracts, 1s. 3d. and  
1s. per oz. also the Preserved Juice, 5s. 4d. per lb., as recommended by  
Mr. Salter, (of Poole,) in Epilepsy.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge,  
33, GREAT RUSSELL-STREET, BLOOMSBURY.

**Cocoa-nut Fibre Matting and Mats,**  
of the best quality.—The Jury of Class 28, Great Exhibition, awarded the Prize Medal to T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate-hill, London.

**Mr. Mechi's Dressing Bags, of an**  
entirely novel construction, as exhibited and sold at the Crystal Palace, combine all the advantages of an ordinary Desk and Dressing Case, with numerous other conveniences for apparel, and are varied in cost to suit the economic, the utilitarian, or the luxurious, either for ladies or gentlemen.  
4, Leadenhall-street.

**Metcalfe and Co's New Pattern**  
TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfume for the toilet.—At METCALFE, BINGLEY, and CO's only establishment, 130 and 131, Oxford-street, second and third doors west from Holles-street. Metcalfe's Alkaline Tooth Powder, 2s. per box.

**Gas-heating Apparatus.—H. Mather**  
begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Griddles, Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, will be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 76, GRAY'S-INN-LANE, LONDON.  
N.B.—Gas-fitting done in all its branches.

**Cholera Prevented! Rettie's Patents.**  
SELF-ACTING SEWER and SINK TRAPS, for Streets and Kitchen Sinks, to prevent all effluvia from Drains, Cesspools, and Urinals. Damp Houses cured at Fourpence per day, giving a dry, warm temperature, for sick or invalids.  
PORTABLE CHAMBER CLOSETS, free from all effluvia.  
Orders to E. M. and M. Rettie, 7, Brompton-road. (Enclose Stamp.)  
N.B.—Beware of imitations on the above Patents.

## HYGIENIC BATHS.

JENSEN'S TONIC

## DAPHNE MAPINA SALT BATHS

When dissolved in a Cold, Tepid, or Warm Bath, imparts so eminently strengthening and beneficial properties to the same, that, when once tried, a Bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known Sea Bath.  
Sold at 1s. per packet, by the Proprietor, C. MATHIO, 103, Leadenhall-street, and 213a, Piccadilly, (near Regent-circus,) and by all Chemists, and Bathing Establishments.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

**Brown's Cantharidine Blistering**  
TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lytta P.L., easily applied and removed, and will not produce strangury or troublesome after-sore. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

**BROWN'S TISSUE DRESSING.**—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1860.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction."

60, Grosvenor-street, London.

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. Brown's BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Strangury.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 43, Admiralty-street, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

GREAT REDUCTION IN PRICE OF

**Sir William Burnett's Disinfecting**  
FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d.

This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street, London-bridge.—N.B. Beware of a spurious imitation.

**The Cholera Prevented by the**  
destruction of all noxious effluvia.

CREWS'S DISINFECTING FLUID. Recommended by the College of Physicians. The cheapest and strongest CHLORIDE OF ZINC.

Quarts, 2s.; Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

**Mineral Waters.—W. Best begs to**

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seidlitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-de-Cologne, Arguebuzard, and Foreign Mineral Water Depot, 22, Henrietta-street, Cavendish-square.—N.B. Balls and evening parties supplied with German and Struve's Artificial Seltzer Water on Advantageous terms.  
N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

**Struve's Seltzer, Fachingen, Vichy,**

and other MINERAL WATERS. Under her Majesty's especial patronage.—ROYAL GERMAN SPA, BRIGHTON. The Pump-room and Promenades, offering every facility for a Course of Mineral Waters as perfect and beneficial as at the natural springs, are NOW OPEN for the 30th Season. Orders for Struve's Bottled Mineral Waters continue to be executed by George Waugh and Co., Chemists to the Queen, 177, Regent-street (west side), London, and by numerous other respectable houses in London and the provincial towns, where a printed account of Struve's Mineral Waters may be obtained gratis.

CAUTION.—Struve and Co. have no connexion with waters advertised under the general designation of "Brighton Seltzer," "Brighton Fachingen," &c., and every genuine bottle of Struve's Waters has the name of "Struve" on the label, as well as on both sides of the red-ink stamp over the cork, having the words "Royal German Spa, Brighton," under the Royal Arms.

**Drug Price Currents forwarded free:**

of Postage, on application, by Messrs. HEWLETT and GODDARD, Wholesale Druggists, 6, Arthur-street West, Upper Thames-street, near London Bridge, removed from Hatton-garden; containing the ready Cash Prices for Drugs and Pharmaceutical Preparations of the purest quality, Messrs. H. and G. solicit the attention of the Medical Profession resident in the Provinces, Infirmary Committees, Dispensaries, &c. &c., to the advantages attendant upon the above Price Current.

**The Pulvis Jacobi Verus, prepared**

by WILLIAM HOOPER, 24, Russell-street, Covent-garden, from its identity with the more costly preparations, and its acknowledged efficacy as an Antimonial, merits the patronage of those gentlemen who have not hitherto included Pulvis Jacobi in their daily Materia Medica. An extensive continuous demand for Public Institutions has satisfactorily verified the ancient character of this medicine. It is sold in 1 oz. and 4 oz. bottles, at 2s. 9d. and 10s. 6d.; and in packets for transmission by post.

FOR EPILEPSY.

**Cotyledon Umbilicus.—The intro-**

duction of this valuable agent has proved a valuable discovery. The satisfactory accounts Mr. HOOPER has received have induced him to pay great attention to its collection and preparation. He cautions medical men against the use of worthless preparations, passed off for his, and as prepared for Mr. Salter, &c. Mr. Hooper has instructions to state that Mr. Salter never used any but what he has obtained from him. A copy of Mr. Salter's reports in the "Medical Gazette" sent free by post.

HOOPER, Operative Chemist, Pall Mall East, and Grosvenor-street.

**W. Twinberrow begs to draw the**

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible: also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Cotyledon Umbilicus, &c.) also to his Liq. Taraxac, Liq. Galli Aparinis (a valuable alterative), Liq. Parietaris (diuretic), and Liq. Belos (prepared from the Egle Marmelos, or Indian Bael), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BARK on hand.

2, Edwards-street, Portman-square.

**Dinneford's Pure Fluid Magnesia,**

now greatly improved in purity and condensation.

"Mr. Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—PHARMACEUTICAL JOURNAL, May, 1846.

This excellent remedy, in addition to its extensive and increasing sale amongst the public, is now very largely employed in DISPENSING for which the cheapest and most convenient form is in the BROWN JARS; half-gallon, 6s. 6d.; gallon, 9s. 6d.; specially adapted for the use of Surgeons and Chemists. To be had from the manufacturers, DINNEFORD & CO., Chemists, 173, Bond-street, London; and all respectable Wholesale Druggists and Patent Medicine Houses.

# New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES—449, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.

CAPITAL, £100,000.

## TRUSTEES.

SIR JAMES DUKE, Bart., Ald., M.P.  
WILLIAM FERGUSON, Esq., F.R.S.  
SIR CHARLES HASTINGS, M.D., D.C.L.  
GEORGE JAMES GUTHRIE, Esq., F.R.S.

## DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.  
GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

The progress of the Company, from its commencement to the end of the year 1853, is shown at a glance in the subjoined Table:—

	Number of Policies issued.	Sums Assured.	Annual Premiums.
1851	301	£ 98,500	£ 3,439 s. 0 d. 1
1852	677	278,855	10,608 12 2
1853	1025	413,785	15,836 3 6

## MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DULY-QUALIFIED MEDICAL PRACTITIONERS AS THE MEDICAL ADVISERS OF THE COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.

MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. ON ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES EFFECTED THROUGH THEIR INTRODUCTION.

EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and influential AGENTS wanted.

# Hooper's Waterproof Sheeting, for

protecting Bedding from Sloughing Sores, Incontinence of Urine, Hemorrhage, &c.

MR. HOOPER has succeeded in obtaining Waterproof Sheeting, at a great reduction in price, soft, and inodorous; it is not affected by Urine, Heat, nor Cold, Acids, nor Alkalies, and may be washed as family linen.

Also, IMPROVED INVALID URINALS, with Valves, for sitting, lying, or travelling, in any position.

HOOPER, Pall Mall East, and Grosvenor-street, London.

# Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1.

FIG. 2.

FIG. 1. THE BELT AND AIR-PAD FOR FEMORAL HERNIA.—MR. Bourjeaud begs to state that this has been extensively tried, and has met with great approbation, especially at Guy's and St. Bartholomew's Hospitals. (See THE LANCET, Jan. 10th, 1852, page 43; and March 13th, 1852, page 267.) The air-pad is carefully adjusted, so that it may exactly rest on the femoral ring, the tube and stopcock being free, to allow of the pad being subjected to more or less insufflation. The belts in all these apparatuses possess the great advantage of encompassing the abdomen without distressing the patient, and of giving such support to the intestines as to lessen the chance of hernial protrusion. It is, in fact, extremely erroneous to confine the pressure to the rings; the whole abdominal mass should be well supported, and the pressure on the rings will then be effectual, without being exerted with the violence so often connected with the steel trusses.

FIG. 2.—APPARATUS FOR UMBILICAL HERNIA.—The belt is of the same kind as those figured in the other diagrams, but an air-pad sufficiently large is here fixed to the centre of the belt, and has the advantage, by its yielding and resilient properties, to fill, in some degree, the umbilical ring; thereby preventing protrusion, and leading the way, especially in children, to the final closure of the ring. Mr. Bourjeaud has had several cases of radical cure with young subjects. (See THE LANCET, July 12th, 1851, page 33; and Feb. 12th, 1853, page 153.)

# Engineers' Masonic and Universal

MUTUAL LIFE ASSURANCE SOCIETY, 345, Strand, London.

During the prevalence of Cholera, Policies for three months (renewable, if required, at the expiration of that period) are granted by this Society, covering the risk, not only of Cholera, but of all other diseases. Rates may be obtained at the Office.

Annuitants admitted to a share in the Profits.

No charge for Policy Stamps.

Credit given for half the Premium.

Assignments and Transfers of Policies registered free of charge.

A liberal commission allowed to Solicitors and Agents on the introduction of business.

ANTHONY PECK, M.A., Actuary and Secretary.

# Elastic Supporting Belts, of the same

beautiful fabric as Pope and Planter's Elastic Stockings for Varicose Veins. Those for ladies' use, before and after accouchement, are ADMIRABLY ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed.

Instructions for measurement and prices on application, and the articles sent by post from the manufacturers, POPE and PLANTE, 4, Waterloo-place Pall Mall, London.

# A New Discovery.—Mr. Howard,

Surgeon-Dentist, 52, Fleet-street, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without springs, wires, or ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR OR DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed teeth rendered sound and useful in mastication.

52, Fleet-street. At home from Ten till Five.

# Meinig's Electro-Generator,

FOR CHOLERA.

TO THE MEDICAL PROFESSION.

Having witnessed personally the greatest benefit, in the first stages of Cholera, derived from the application of weak, continuous currents of Electricity from the spine to the abdomen, by which the warmth and action of the digestive organs is maintained, and the urinary functions stimulated; and feeling confident that in an advanced stage of the disease strong, uninterrupted Electric Currents passed along the cramped and paralyzed limbs, and along the spinal column, will be found of paramount efficacy in restoring normal circulation, Mr. Meinig earnestly invites the Medical Profession to test and investigate the effects of Electricity in the now prevalent epidemic; and so confident does he feel of the all but marvellous success of his Apparatus in this dreadful disease, that any medical gentleman who desires it may receive Mr. Meinig's warrant, to the effect that he will retake and repay, within one month after the purchase, any Apparatus which, after trial, it might be wished to return.

Prices of the Portable Generator: 5s., 10s. 6d., 15s., 20s., and 30s., according to power. Powerful Pocket Batteries, £3 3s.

103, LEADENHALL-STREET, and 213A, PICCADILLY.

# Railway Travellers, and all persons

suffering from weakness, should obtain one of W. S. SPARKS'S newly-invented URINALS, for night and day use, for both male and female. They are made on the most approved principles, so as to prevent any unpleasantness, are very durable, and at prices within the reach of all. W. S. also manufactures all articles in india-rubber and gutta-percha for invalids, including bed-pans, sheeting, water and air cushions, pillows and mattresses, hearing-tubes, portable baths, elastic bandages, stockings, knee-caps, &c. &c. Water-beds on sale or hire. The medical profession, hospitals, and country dealers supplied on the best terms, and circulars, &c. forwarded on application.—W. S. SPARKS, India-rubber Manufacturer, 115, New Bond-street.

# Walters' India-rubber URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

Made of Solid India-rubber, with Patent Valve, and adapted for Ladies, Gentlemen, and Children.

Manufacturer also of the PATENT HYDRO-STATIC TRUSS. One of the advantages of this Truss is, that the pad, being filled with water, adapts itself with perfect accuracy to the form of the body, thereby keeping up a firm but easy pressure on the internal ring.

F. WALTERS,

16, MOORGATE-STREET, LONDON.

**Hooper's Invalid Water Cushions and Mattresses, or Beds, for Bed-sores,** whether threatened with Sloughing, or in which Sloughing has actually taken place.—Fractures, Diseased Joints, Ulcerated Cartilages, Paralysis, Spinal Affections, Renal Diseases, Inflammation of the Bowels, Spasms, Lassitude, Typhoid and other Fevers, Gout and Rheumatic Affections, Cancer, Ovarian Dropsy, Coldness of the Stomach and Feet, Consumptive, and all Bed-ridden Patients. Mr. Hooper has succeeded in obtaining Waterproof Sheetings (Bed Protectors) at a Great Reduction in Price, Free from Smell, and not affected by Temperature, Urine, Acids, or Alkalies; and, MAY BE WASHED AS FAMILY LINEN. Also—

**IMPROVED URINALS, AND ELASTIC BED PANS, OR RECEPTACLES,**

INDIA-RUBBER, ENEMA, and DOUCHE, answering equally for either purpose, and may be carried in the Pocket.

For Hospitals and other Institutions a Discount is allowed. Their advantages over the costly and cumbersome Water Beds have been published in the Medical Journals, and they are particularly applicable for Paralytic and Lunatic Patients.

"I HAVE in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water-Bed."

"JONAS PEREIRA, M.D.,

"Physician to the London Hospital.

Sherardian Professor of Botany: C. G. B. Daubeny, M.D.

Lichfield's Clinical Medicine: J. Adey Ogle, M.D.

Aldrichian Professor of Anatomy: Ditto.

Aldrichian Professor of Medicine: Ditto.

Aldrichian Professor of Chemistry: C. G. B. Daubeny, M.D.

Lee's Lecturer in Anatomy: H. Wentworth Acland, M.D.

### EXERCISES FOR DEGREES.

1st. *To perform the exercise called Responsions*, consisting of an examination in the Greek and Latin languages, in the rudiments of Logic, or in Euclid's Elements of Geometry.

2nd. *To be publicly examined*. 1st. *The rudiments of religion*; 2nd. *The literæ humaniores*; 3rd. *The elements of the mathematical sciences, and of physics*. In Medicine, all students (besides undergoing the two examinations appointed for Bachelors of Arts) are to be examined in the Theory and Practice of Medicine, Anatomy, Physiology, and Pathology; in Materia Medica, and in Chemistry and Botany, so far as they illustrate the science of Medicine; and in two at least of the following ancient medical writers: Hippocrates, Aretæus, Galen, and Celsus. For a Doctor's degree in Medicine, a dissertation upon some subject, to be approved of by the regius professor of Medicine, is to be publicly recited in the Schools, and a copy of it afterwards delivered to the professor. Degrees are conferred once a year.

## UNIVERSITY OF CAMBRIDGE.

*Chancellor*—H. R. H. Prince Albert, LL.D., &c.

*High Steward*—Lord Lyndhurst, LL.D.

*Vice-Chancellor*—T. C. Geldart, LL.D.

*Registrar*—J. Romilly, M.A.

*Professors*—Regius Professor of Physic: H. J. H. Bond, M.D.

Professor of Chemistry: James Cumming, M.A., F.R.S.

Professor of Anatomy: William Clark, M.D.

Professor of Botany: Rev. J. S. Henslow, M.A., F.L.S.

Downing Professor of Medicine: W. W. Fisher, M.D.

Linacre Lecturer of Physic: G. E. Paget, M.D.

### REGULATIONS.

*Proceedings in Physic*. M.B.—A student, before he can become a Bachelor of Physic, must have entered on his sixth year, computed from the date of his first admission at the University, have resided nine terms, and have passed the previous examination.

The examination in Chemistry and Botany may take place after the expiration of three years from their first admission at the University; that in Anatomy and Medicine after the expiration of four years.

The exercises for this degree are one Act and one Opponency (academical disputations).

M.D.—The degree of Doctor of Physic is granted to a Bachelor of Physic of five years', or to a Master of Arts of seven years' standing. The exercises for this degree are two Acts and one Opponency.

Every candidate for the degree of Doctor of Physic is required to produce the same certificates, and pass the same examination, as are required in the case of candidates for a licence *ad practicandum in Medicina*.

L.M.—Candidates for a licence *ad practicandum in Medicina*, being previously Bachelors of Physic, are required to produce certificates of their having attended hospital practice for three years, exclusive of the nine terms which they kept by No. 1620.

residence for the degree of Bachelor of Physic, and of their having attended lectures on the following subjects—viz., Practice of Physic and Pathology, Anatomy and Physiology, Chemistry, Botany, Medical Jurisprudence, Materia Medica, and Pharmacy, Principles of Surgery, Principles of Midwifery, Practical Anatomy for two seasons.

Candidates for a licence *ad practicandum in Medicina*, being previously Masters of Arts, are required to bring satisfactory evidence of their having been employed in the study of Physic for five years, after they became Bachelors of Arts, and to produce certificates of their having attended on hospital practice for three of the said five years, and of their having attended lectures on the subjects before mentioned.

Every candidate for a licence *ad practicandum in Medicina* is required to pass an examination to the satisfaction of the Regius Professor of Physic, the Professor of Anatomy, the Downing Professor of Medicine, and a Doctor of Physic, to be nominated by the Vice Chancellor, and approved by the senate. There are two such examinations in every year.

This licence gives the privilege of practising Medicine in any part of the United Kingdom, except in London and within seven miles thereof, for which the diploma of the College of Physicians is necessary.

## UNIVERSITY OF LONDON,

*Warborough House.*

*Visitor*—Her Majesty the Queen.

*Chancellor*—The Earl of Burlington, LL.D., F.R.S.

*Vice-Chancellor*—John G. Shaw Lefevre, Esq., C.B., M.A., F.R.S.

*Registrar*—R. W. Rothman, M.A., M.D.

*Clerk to the Senate*—H. Moore.

### EXAMINERS.

FACULTY OF MEDICINE.—Intellectual Philosophy, Logic, and Moral Philosophy: Rev. Henry Alford, B.D.; T. B. Burcham, Esq., M.A.

Medicine: Archibald Billing, M.A., M.D., F.R.S.; Alex. Tweedie, M.D., F.R.S.

Surgery: Sir Stephen L. Hammick, Bart.; Joseph Hodgson, Esq., F.R.S.

Anatomy and Physiology: Francis Kiernan, Esq., F.R.S.; William Sharpey, M.D., F.R.S.

Physiology and Comparative Anatomy: W. B. Carpenter, M.D., F.R.S.

Midwifery: Edward Rigby, M.D.

Chemistry: W. Thomas Brande, Esq., F.R.S.

Botany: Rev. J. S. Henslow, M.A.

Materia Medica and Pharmacy: G. Owen Rees, M.D., F.R.S.

### EXAMINATIONS FOR THE DEGREE OF BACHELOR OF MEDICINE.

Candidates for the degree of Bachelor of Medicine are required—1. To have been engaged during four years in their professional studies at one or more of the institutions or schools recognised by this University. 2. To have spent one year at least of the four in one or more of the recognised institutions or schools in the United Kingdom. 3. To pass two examinations.

#### FIRST EXAMINATION.

The First Examination commences on the first Monday in August. The candidate is required to produce certificates—1. Of having completed his nineteenth year. 2. Of having taken a degree in Arts in this University, or in an university the degrees granted by which are recognised by the senate; or of having passed the matriculation examination. 3. Of having been a student during two years at a medical school recognised by this University, subsequently to having taken a degree in Arts, or passed the matriculation examination. 4. Of having attended a course of lectures on each of four of the subjects in the following list:—Descriptive and Surgical Anatomy, General Anatomy and Physiology, Comparative Anatomy, Pathological Anatomy, Chemistry, Botany, Materia Medica and Pharmacy, General Pathology, General Therapeutics, Forensic Medicine, Hygiene, Midwifery and Diseases peculiar to Women and Infants, Surgery, Medicine. 5. Of having dissected during nine months. 6. Of having attended a comprehensive course of Practical Chemistry. 7. Of having attended to Practical Pharmacy sufficiently to acquire a practical knowledge in the preparation of medicines. The fee for examination is five pounds. Candidates are examined in Anatomy, Physiology, Chemistry, Botany, (a syllabus of which may be had by application at the office of the University,) and Materia

Medica and Pharmacy; they are also required to translate passages from the Latin Pharmacopœia. In the week next following the examination, the examiners arrange in two divisions such of the candidates as shall have passed; and a certificate, signed by the registrar, is delivered to each candidate.

#### SECOND EXAMINATION.

The Second Examination commences on the first Monday in November. No candidate is admitted to this examination within two academical years of the first examination. Certificates required—1. Of having passed the first examination. 2. Of having subsequently attended a course of lectures on each of two of the subjects in the foregoing list, and for which the candidate did not present certificates at the first examination. 3. Of having, since the first examination, dissected during six months. 4. Of having conducted at least six labours. 5. Of having attended the surgical practice of a recognised hospital or hospitals during twelve months, and lectures on clinical surgery. 6. Of having attended the medical practice of a recognised hospital or hospitals during other twelve months, and lectures on clinical medicine. 7. Of having subsequently attended to practical medicine in a recognised hospital, infirmary, or dispensary, during six months. 8. Of moral character from a teacher in the last school or institution at which he studied. The fee for examination is five pounds. Candidates are examined in Physiology, (including Comparative Anatomy;) General Pathology, General Therapeutics, and Hygiene; Surgery; Medicine; Midwifery; Forensic Medicine; they are also required to translate passages of the Latin Pharmacopœia into English, and of the English Pharmacopœia into Latin, and to report on the cases of actual patients. In the following week the examiners arrange in two divisions such of the candidates as shall have passed; and a certificate under the seal of the University, and signed by the Chancellor, is delivered to each candidate.

#### EXAMINATION FOR THE DEGREE OF DOCTOR OF MEDICINE.

The examination commences on the fourth Monday in November. Certificates required—1. Of having taken the degree of Bachelor of Medicine in this University, or a degree in medicine or in surgery at an university the degrees granted by which are recognised by the senate. (Those candidates who have not taken the degree in this University must produce a certificate of having completed their twenty-third year.) 2. Of having attended, subsequently to having taken one of the above degrees, (a) to clinical or practical medicine during two years in a medical institution recognised by this University; (b) or, to clinical or practical medicine during one year, and of having been engaged during three years in the practice of his profession; (c) or, if he have taken the degree of Bachelor of Medicine in this University, of having been engaged during five years in the practice of his profession. (One year of attendance on clinical or practical medicine, or two years of practice, will be dispensed with in the case of those candidates who at the second examination were placed in the first division.) 3. Of moral character, signed by two persons of respectability. The fee for examination is £10.

*Candidates are examined in the following subjects:*—Elements of Intellectual Philosophy, Logic, and Moral Philosophy; Medicine. A Commentary on a Case in Medicine, Surgery, or Midwifery, at the option of the candidate. *Viva voce* interrogations on the answers to the printed papers, and on the Commentary. The candidate is also required to report on cases of actual patients. In the following week the examiners arrange in two divisions, each in alphabetical order, such of the candidates as shall have passed; and a certificate, under the seal of the University, and signed by the Chancellor, is delivered to each candidate.

#### REGULATIONS RELATING TO STUDENTS WHO COMMENCED THEIR MEDICAL STUDIES IN OR BEFORE JANUARY, 1839.

**DEGREE OF BACHELOR OF MEDICINE.**—Candidates who commenced their professional studies in or before January, 1839, being then not less than fourteen years of age, will be admitted to the first examination for the degree of Bachelor of Medicine, on producing certificates—1. Of having been engaged during two years in their professional studies. 2. Of having attended a course of lectures on each of four of the subjects comprehended in the foregoing list. 3. Of having dissected during nine months. 4. Of having attended to practical pharmacy.

They will be admitted to the second examination on producing certificates—1. Of having been engaged during four years in their professional studies. 2. Of having passed the

first examination. 3. Of having attended a course of lectures on each of two of the subjects in the foregoing list, in addition to those for which certificates were produced at the first examination. 4. Of having dissected during twelve months. 5. Of having attended to practical pharmacy. 6. Of having conducted at least six labours. 7. Of having attended the surgical practice of a recognised hospital or hospitals during twelve months. 8. Of having attended the medical practice of a recognised hospital or hospitals during other twelve months. 9. Of having completed their twenty-second year. 10. Of moral character, from a teacher in the last school or institution at which they studied. Candidates who have not taken a degree in Arts, or passed the matriculation examination, translate a portion of *CELSUS de Re Medica*.

#### REGULATIONS RELATING TO PRACTITIONERS IN MEDICINE OR SURGERY DESIROUS OF OBTAINING DEGREES IN MEDICINE.

**DEGREE OF BACHELOR OF MEDICINE.**—Candidates admitted to the two examinations on producing certificates—1. Of having been admitted, prior to 1840, members of one of the legally-constituted bodies in the United Kingdom for licensing practitioners in medicine or surgery; or of having served, previously to 1840, as surgeons or assistant-surgeons in her Majesty's Army, Ordnance, or Navy, or in the service of the East India Company. 2. Of having received a part of their education at a recognised institution or school, as required by the charter of the University. 3. Of moral character, signed by two persons of respectability. Candidates who have not taken a degree in Arts, or passed the matriculation examination, translate a portion of *CELSUS de Re Medica*.

**DEGREE OF DOCTOR OF MEDICINE.**—Candidates are admitted to examination on producing certificates—1. Of having been engaged during five years in the practice of their profession. 2. Of having taken the degree of Bachelor of Medicine. Candidates who have not taken a degree in Arts, or passed the matriculation examination, translate a portion of *CELSUS de Re Medica*.

In the case of a candidate who fails to pass any one of the examinations, the fee is not returned to him, but he may present himself at a subsequent examination without any additional fee. Certificates must be sent in at least fourteen days before the commencement of the examination to which they relate.

N.B.—By a recent Act of Parliament, medical graduates of this University possess the same privileges in regard to the practice of their profession as the graduates of Oxford and Cambridge.

#### UNIVERSITY OF DURHAM.

THOSE students who matriculate at the University of Durham are enabled to proceed in the first place to a licence in Medicine, and then to the degrees of Bachelor and Doctor of Medicine in that University.

The course required is as follows:—One year's residence in the University of Durham, and attendance on lectures similar to those given to students in Arts in their first year. At the end of this year all students in Medicine are required to pass an examination in the rudiments of religion, literature, and science.

Students of Medicine who have passed their first examination must afterwards pursue their studies for three years in the College of Medicine at Newcastle, and then, preparatory to obtaining a licence in Medicine, pass at Durham the final examination, which will be directed to the medical sciences.

Licentiates in Medicine may proceed to the degrees of Bachelor and Doctor of Medicine, by performing such exercises as the warden and senate of the University of Durham shall appoint. Such licentiates being of the standing of twenty-one terms from the date of matriculation for the degree of Bachelor, and of thirty-three terms for the degree of Doctor of Medicine.

#### ROYAL COLLEGE OF PHYSICIANS, LONDON,

*Pal Mall East, Trafalgar-square.*

*President*—Dr. John Ayrton Paris.

*Censors*—Drs. F. J. Farre, Barker, Hughes, and Seth Thompson.

*Elects*—Drs. Thomas Turner, Clement Hue, John Bright, Edward Thomas Monro, Thomas Mayo, Henry Herbert Southey, Francis Hawkins.

*Treasurer*—Dr. Alderson.

*Registrar*—Dr. Francis Hawkins.

*The Examiners for the Licence are the President and Censors.*

The examinations take place on or about Christmas, Easter, Midsummer, and Michaelmas. The Examiners for the Extra-Licence are the President and three Elects. The examinations for the Extra-Licence take place at the same time as the former.

**FEES.**—*Licence*, £56 17s., including £15 stamp. *Fellowship*, £55 1s., including £25 stamp. *Extra-Licence*, about £26.

#### REGULATIONS, DATED 1838, AND NOW IN FORCE.

Every candidate for a licence or extra-licence must produce evidence—

1. Of unimpeached moral character.
2. Of having completed the twenty-sixth year of his age.
3. Of having devoted himself, for five years at least, to the study of medicine.

The course of study thus ordered by the College comprises:—Anatomy and Physiology; the Theory and Practice of Physic; Forensic Medicine; *Materia Medica* and Botany; and the Principles of Midwifery and Surgery.

Attendance for three entire years on the physicians' practice of some general hospital or hospitals in Great Britain or Ireland, containing at least 100 beds, and having a regular establishment of physicians as well as surgeons.

Candidates who have been educated abroad, in addition to the full course of study specified, must have diligently attended the physicians' practice in some general hospital in this country, for at least twelve months.

Candidates who have already been engaged in practice, and have attained the age of forty years, but have not passed through the complete course of study above described, may be admitted to examination upon presenting to the Censors' Board such testimonials of character, general and professional, as shall be satisfactory to the College.

The first examination is in anatomy and physiology; the second includes all that relates to the causes and symptoms of diseases; the third relates to the treatment of diseases.

The examinations are carried on usually during three days by writing, and two days *visd voce*. The *visd voce* part of each is carried on in Latin, except when the Board deems it expedient to put questions in English, and permits answers to be returned in the same language.

A competent knowledge of Greek is recommended, but is not indispensable, if the other qualifications of the candidate prove satisfactory. The candidate is called on to translate *visd voce* into Latin a passage from Hippocrates, Galen, or Aretæus; or to construe into English a portion of the works of Celsus, or Sydenham, or some other Latin medical author, having been previously required, on three separate days, to give written answers in English to questions on the different subjects enumerated above, and to translate in writing, passages from Greek or Latin books relating to Medicine.

The Fellows are elected from the body of Licentiates—a certain number generally on the 25th of June.

#### ROYAL COLLEGE OF SURGEONS OF ENGLAND,

*Lincoln's Inn-fields.*

*President*—G. J. Guthrie.

*Vice-Presidents*—W. Lawrence and B. Travers.

*The Council*—The President and Vice-Presidents, R. Keate, Sir B. C. Brodie, Bart., C. Hawkins, J. Swan, J. H. Green, E. Stanley, J. M. Arnott, J. F. South, James Luke, F. C. Skey, J. Hodgson, T. Wormald, G. Pilcher, J. Bishop, G. W. Mackmurdo, F. Kiernan, W. Coulson, G. Gulliver, R. Partridge, J. Hilton, and R. Quain.

*Court of Examiners*—G. J. Guthrie, W. Lawrence, B. Travers, R. Keate, E. Stanley, J. H. Green, J. M. Arnott, J. F. South, C. H. Hawkins, and J. Luke.

*Examiners in Midwifery*—Dr. A. Farre, Dr. H. Oldham, and Dr. J. Reid.

*Examiners for the Fellowship in Classics, Mathematics, and French*—G. Smith, G. G. Stokes, and I. Brasseur.

*Professor of Anatomy and Physiology*—Vacant.

*Hunterian Professor*

*Conservator of Museum*

*Professor of Histology*

*Resident Conservator*

*Librarian*—J. Chatte.

*Secretary*—E. Belfour.

R. Owen.

J. T. Quekett.

*Clerk*—T. M. Stone.

*Regulations of the Council respecting the Professional Education of Candidates for the Diploma of Member of the College.*

I. Candidates will be required to produce the following certificates—viz.,

1. Of being twenty-one years of age.
2. Of having been engaged during four years in the acquirement of professional knowledge.
3. Of having studied practical pharmacy during six months.
4. Of having attended at a recognised hospital or hospitals in the United Kingdom the practice of physic during one winter\* and one summer† session.
5. Of having attended, during three winter and two summer sessions, the practice of surgery at a recognised hospital or hospitals in the United Kingdom.
6. Of having studied anatomy and physiology, by attendance on lectures and demonstrations, and by dissections, during three winter sessions.
7. Of having attended, during two winter sessions, lectures on the principles and practice of surgery.
8. Of having attended, during one summer session, lectures on *materia medica*, and lectures on midwifery, practical midwifery to be attended at any time after the conclusion of the session.
9. And of having attended one course of lectures on the practice of physic, and one course on chemistry.

\* \* The course of study hereby prescribed is required to be observed by candidates who shall have pursued their studies in hospitals and schools in England. Those candidates who shall have studied in Scotland are required to bring certificates of having attended lectures on the institutes of medicine during one winter session, and on anatomy during two other winter sessions, and on demonstrations and dissections during three winter sessions, (the foregoing regulations being in all other respects observed.) Candidates who shall have attended lectures on *materia medica* in the University of Dublin will be allowed to bring certificates of such attendance during the winter session.

II. Members or Licentiates of any legally-constituted College of Surgeons in the United Kingdom, and Graduates in surgery of any university requiring residence to obtain degrees, will be admitted for examination on producing their diploma, licence, or degree, together with proof of being twenty-one years of age, and of having been occupied at least four years in the acquirement of professional knowledge.

III. Graduates in Medicine of any legally-constituted college or university requiring residence to obtain degrees, will be admitted for examination on adducing, together with their diploma or degree, proof of having completed the anatomical and surgical education required by the foregoing regulations, either at the school and hospital of the university where they shall have graduated, or at one or more of the recognised schools and hospitals in the United Kingdom.

IV. Candidates who shall have attended at recognised colonial hospitals and schools,‡ the medical and surgical practice and the several courses of lectures, with the demonstrations and dissections, required by the foregoing regulations, will be admitted for examination upon producing certificates of such attendance, together with certificates of having attended in London, during one winter session, the surgical practice of a recognised hospital, and lectures on anatomy, physiology, and surgery, with demonstrations and dissections.

V. Certificates will not be recognised from any hospital unless the surgeons thereto be members of one of the legally-constituted Colleges of Surgeons in the United Kingdom; nor from any school of anatomy and physiology or midwifery, unless the teachers in such school be members of some legally-constituted College of Physicians or Surgeons in the United Kingdom; nor from any school of surgery, unless the teachers in such school be members of one of the legally-constituted Colleges of Surgeons in the United Kingdom.

VI. Certificates will not be received on more than one branch of science from one and the same lecturer; but anatomy and physiology—demonstrations and dissections—will be respectively considered as one branch of science; and in those schools in Scotland or Ireland in which such division of those subjects is sanctioned by the College of Surgeons in each kingdom, the

\* The winter session comprises a period of six months, and, in England, commences on the 1st of October, and terminates on the 31st of March.

† The summer session comprises a period of three months, and, in England, commences on the 1st of May, and terminates on the 31st of July.

‡ No provincial hospital will be recognised by this College which contains less than 100 patients; and no metropolitan hospital which contains less than 160 patients.

§ The recognition of colonial hospitals and schools is governed by the same regulations, with respect to number of patients, to courses of lectures, and to physicians, surgeons, and lecturers, as apply to the recognition of provincial hospitals and schools in England.

institutes of Medicine—anatomy, demonstrations, and dissections—may be separately certified.

VII. Certificates will not be received from candidates who have studied in London, unless they shall have registered their tickets at the College, as required by the regulations, during the last ten days of January, March, and October in each year; nor from candidates who have studied elsewhere, unless their names shall duly appear in the registers transmitted during such studies from their respective schools.

N.B. In the certificates of attendance on hospital practice and on lectures, it is required that the dates of commencement and termination be clearly expressed; and no interlineation, erasure, or alteration will be allowed.

Blank forms of the required certificates may be obtained on application to the Secretary, to whom they must be delivered, properly filled up, ten days before the candidate can be admitted to examination; and all such certificates are retained at the College.

#### REGULATIONS OF THE COUNCIL RESPECTING THE PROFESSIONAL EDUCATION OF CANDIDATES FOR THE CERTIFICATE OF QUALIFICATION IN MIDWIFERY.

1. Persons who were Fellows or Members of the College prior to the 1st day of January, 1853, will be admitted to examination for the certificate of qualification in Midwifery upon producing their diploma.

2. Persons having become Members of the College subsequently to the 1st of January, 1853, will be admitted to examination on producing their diploma, together with a certificate or certificates of having attended twenty labours.

3. Members or Licentiates of any legally-constituted College of Surgeons in the United Kingdom, and Graduates in Surgery of any University requiring residence to obtain degrees, will also be admitted to examination on producing, together with their diploma, licence, or degree, proof of being twenty-one years of age—of having been occupied four years in the acquirement of professional knowledge—of having attended one course of lectures on midwifery—and of having attended not less than twenty labours.

4. Graduates in Medicine of any legally-constituted College or University requiring residence to obtain degrees, will also be admitted to examination on producing, together with their diploma or degree, proof of being twenty-one years of age—of having been occupied four years in the acquirement of professional knowledge—of having completed, at recognised schools, the anatomical and surgical education required of candidates for the diploma of Member of the College—of having attended one course of lectures on midwifery—and of having attended not less than twenty labours.

5. Persons having commenced their professional education, either by attendance on hospital practice, or on lectures on anatomy, prior to the 1st of January, 1853, will be admitted to examination on producing the several certificates of professional education required for admission to examination for the diploma of Member of this College at the period when such persons shall respectively have, in such manner, commenced their professional education.

6. Persons having commenced their professional education, either by attendance on hospital practice, or on lectures on anatomy, after the 31st day of December, 1852, will be admitted to examination on producing certificates of being twenty-one years of age—of having been engaged during four years in the acquirement of professional knowledge—of having completed, at recognised schools, the professional education required of candidates for the diploma of Member of this College—of having attended one course of lectures on midwifery and the diseases of women and children—and of having personally conducted thirty labours.

N.B. The fee for the certificate is as follows, viz.:—

1. Persons who were Fellows or Members of this College prior to the 1st of January, 1853, two guineas.

2. Persons admitted Fellows or Members of this College subsequently to the 1st of January, 1853, three guineas.

3, 4. Persons producing any other diploma or certificate of degree which may be considered by the Council to afford satisfactory proof of sufficient surgical and medical education, three guineas.

5, 6. All other persons, ten guineas.

The certificates of attendance on the medical practice of a hospital, commencing on or after the 1st of October, 1854, must be accompanied by certificates of attendance on clinical lectures on medicine during such attendance; and the certificates of attendance, by such candidates, on the surgical

practice of a hospital, commencing on or after the said 1st of October, 1854, must be accompanied by certificates of attendance on clinical lectures on surgery during such attendance.

Such courses of clinical lectures shall, in England and in the colonies, consist of not less than one lecture on medicine and one lecture on surgery in each week during the summer and winter sessions; and in Scotland and Ireland shall consist of such number of lectures as may be, respectively, required by the Royal Colleges of Surgeons of Edinburgh and Ireland.

These lectures shall be additional to clinical instruction given in the wards, and shall have especial reference to cases at the time, or previously under observation in the hospital.

#### THE SOCIETY OF APOTHECARIES,

*Blackfriars.*

*Master*—N. B. Ward, Esq., F.R.S., F.L.S.

*Wardens*—R. C. Griffith, Esq., and J. F. de Grave, Esq.

*The Court of Examiners*—E. Tegart, Esq., *Chairman*; H. Combe, T. Ansell, A. M. Randall, Richard Hopkins Robertson, Richard King, R. C. Walsh, R. Druitt, R. H. Semple, W. G. T. Dyer, T. R. Wheeler, and S. H. Ward, Esqrs.

*Secretary to the Court of Examiners*—Henry Blatch, Esq.

*Clerk to the Society*—Robert Brotherson Upton, Esq.

*Professor of Chemistry and Materia Medica*—William Thomas Brande, Esq., D.C.L., F.R.S.

*Examiner for the Society's Prizes in Botany*—Jos. D. Hooker, M.D., F.L.S.

*Curator of the Botanic Garden*—Mr. T. Moore.

*Beadle*—Mr. C. Rivers.

*Note*.—Members are those who constitute the incorporated Society of Apothecaries; Licentiates, those who have obtained their licence to practise as Apothecaries.

*Regulations to be observed by Students intending to Qualify themselves to Practise as Apothecaries in England and Wales.* (Dated 1848.)

Candidates will be required to produce testimonials—

1. Of having served an apprenticeship of not less than five years to an apothecary, legally qualified to practise as an apothecary, either by having been in practice prior to or on the 1st of August, 1815, or by having received a certificate of his qualification from the Court of Examiners, or of an apprenticeship for not less than five years to surgeons practising as apothecaries in Ireland and Scotland.

2. Of having attained the full age of twenty-one years: As evidence of age a copy of the baptismal register will be required in every case where it can possibly be obtained.

3. Of good moral conduct: A testimony of moral character from the gentleman to whom the candidate has been an apprentice will always be more satisfactory than from any other person.

4. And of having pursued a course of medical study in conformity with the regulations of the Court.

#### COURSE OF STUDY.

Every candidate whose attendance on lectures shall have commenced on or after the 1st of October, 1849, must attend the following lectures and medical practice during not less than three winter and two summer sessions—each winter session to consist of not less than six months, and to commence not sooner than the 1st, nor later than the 15th of October; and each summer session to extend from the 1st of May to the 31st of July.

*FIRST YEAR.*—*Winter Session*: Chemistry; Anatomy and Physiology; Anatomical Demonstrations.—*Summer Session*: Materia Medica and Therapeutics; Botany and Vegetable Physiology; Midwifery and Diseases of Women and Children.

*SECOND YEAR.*—*Winter Session*: Anatomy and Physiology; Anatomical Demonstrations; Dissections; Principles and Practice of Medicine; Medical Practice.\*—*Summer Session*: Medical Practice;† Midwifery and Diseases of Women and Children; Forensic Medicine; Practical Chemistry;‡ Morbid Anatomy and Clinical Medicine.

*THIRD YEAR.*—*Winter Session*: Dissections; Principles and Practice of Medicine; Medical Practice;§ Morbid Anatomy and Clinical Medicine.

\* Medical Practice must be attended during the full term of eighteen months—twelve months at a recognised hospital, and six months either at a recognised hospital or dispensary.

† By Practical Chemistry is intended a *specific* course of instruction in the laboratory, with an opportunity of personal manipulation in the ordinary processes of chemistry, and of acquiring a knowledge of the various re-agents for poisons.

Practical Midwifery at any time after the conclusion of the first course of midwifery lectures.

The above course of study may be extended over a longer period than three winter and two summer sessions, provided the lectures and medical practice are attended in the order prescribed.

The Court particularly request the attention of students to the increasing importance of Organic Chemistry and Structural and Physiological Botany.

Every examination of an hour's duration will be deemed equivalent to a lecture.\*

Students must also produce testimonials of attendance on a course of clinical lectures; of instruction in morbid anatomy; and of having dissected the whole of the human body once at least.†

Those gentlemen whose attendance on lectures commenced before the 1st of October, 1849, will be allowed to complete their studies in conformity with the previous regulations of the Court.

The names of the lecturers recognised by the Court may be known on application to the Secretary, at the hall of the Society.

The certificates of teachers recognised by the constituted medical authorities in Dublin, Edinburgh, Glasgow, and Aberdeen, as also those of the medical professors in foreign universities, are received by the Court.

No dispensary will be recognised by the Court, unless it be situated in some town where there is a recognised medical school, and be under the care of at least two physicians and an apothecary legally qualified.

No medical practice will be available unless it be attended in conformity with the course of study prescribed for pupils.

#### REGISTRATION OF TESTIMONIALS.

All testimonials must be given on a printed schedule, with which students will be supplied at the end of their first registration:—

In London, at the Hall; in the provincial towns, from the gentlemen who keep the registers of the medical schools.

All students, in London, are required *personally* to register the several classes for which they have taken tickets; and those only will be considered as complying with the regulations of the Court whose names and classes in the register correspond with their schedules.

Tickets of admission to lectures and medical practice must be registered in the months of October and May; but no ticket will be registered unless it be dated within *seven* days of the commencement of the course.

The Court also requires students at the provincial medical schools to register their names in their own handwriting, with the register of each respective school, within the first twenty-one days of October, and first fourteen days of May; and to register their certificates of having duly attended lectures on medical practice within fourteen days of the completion of such attendance.

#### PRELIMINARY EXAMINATION IN CLASSICS AND MATHEMATICS.

*Regulations, dated August, 1854*—An examination in classics and mathematics for junior students will be held at the Hall three times in the year—viz., on the third Tuesday in the months of November, 1854, March and July, 1855, at eleven o'clock.

Medical students *cannot* be admitted to this examination before the commencement of their apprenticeship, a certificate of which will be required, but at any period from that date to the commencement of the second winter session of their curriculum.

The examination is at present voluntary, and is conducted both by printed papers and *visd voce*.

The subjects of the present year will be:—In Greek: The First Book of Homer's Iliad, and the Gospel of St. Luke. In Latin: The First Book of Virgil's Georgics, and the Catiline War of Sallust. Mathematical: The First Book of Euclid's Elements, Arithmetical, and Algebra, including Simple Equations.

Candidates who fail to pass this examination cannot be re-admitted, but will be required to pass the Latin examination

\* The Court particularly request attention to this clause.

† In place of the Second Course of Lectures on the Theory and Practice of Medicine, the Court will admit a certificate of attendance on a course of Clinical Lectures, delivered in a recognised hospital by a distinct Professor, consisting of not less than seventy-five lectures, attended by the student after the first systematic course upon the Theory and Practice of Medicine.

in *Celsus* and *Gregory* when they appear for their final examination.

Students wishing to attend are requested to send their name and address to Mr. Rivers, Beadle's Office, at this Hall, at the latest, *one calendar month* previous to the day of examination.

#### GENERAL EXAMINATION.

Every person intending to offer himself for examination must give notice in writing to the clerk of the Society, on or before the Monday previously to the day of examination, and must at the same time deposit all the required testimonials at the office of the beadle, where attendance is given every day, except Sunday, from ten until four o'clock.

The examination of the candidate for a certificate of a qualification to practise as an apothecary will be as follows:—

In translating portions of the first four books of *Celsus de Medicina*, and of the first twenty-three chapters of *Gregory's Conspectus Medicinæ Theoreticæ*:

In Physicians' Prescriptions, and the *Pharmacopœia Londinensis*:

In Chemistry: In Practical Chemistry:

In Materia Medica and Therapeutics:

In Botany: In Anatomy: In Physiology:

In the Principles and Practice of Medicine, including Midwifery and the Diseases of Children.

By the 22nd section of the Act of Parliament, no rejected candidate for a certificate to practise as an apothecary can be re-examined until the expiration of six months from his former examination; and no rejected candidate as an assistant until the expiration of three months.

The Court meet in the Hall every Thursday, where candidates are required to attend at a quarter before four o'clock.

Sums to be paid for certificates:—

For London, and within ten miles thereof, ten guineas.

For all other parts of England and Wales, six guineas.

Persons having paid the latter sum become entitled to practise in London, and within ten miles thereof, by paying four guineas in addition.

#### ARMY AND ORDNANCE MEDICAL DEPARTMENT,

13, St. James's-place.

Director-General—Dr. Andrew Smith.

Deputy Inspector-General of Hospitals—Dr. Spence, Professional Assistant, and Inspector of Regimental Hospitals.

Inspector of Medicines and Instruments—Staff Surgeon H. Pilleau, First Class.

Examiner of Medical Returns and Reports, &c. &c.—Staff-Surgeon D. F. Reid, Second Class.

Apothecary to the Forces—F. M. Bassano, Esq.

In selecting from amongst the candidates for the Medical Department of the Army, a preference is given to those who can fill up all the blanks in the printed schedules, by having the acquirements therein stated. The name of no gentleman can be placed on the list who does not possess a diploma from the Royal College of Surgeons of England, Scotland, or Ireland, or from the Faculty of Physicians and Surgeons of Glasgow, or other corporate body legally entitled to grant a diploma in Surgery, and who cannot produce the following testimonials:—

Eighteen months' attendance at an hospital, where the average number of in-patients is not less than one hundred; twelve months' anatomy; twelve months' practical anatomy; six months' physiology; twelve months' surgery, or (what is preferred) six months' surgery and six months' military surgery; eight months' clinical surgery, a complete course of two or three lectures during the week; twelve months' practice of physic, or six months' practice of physic and six of general pathology; eight months' clinical lectures on ditto, the same as required in surgery; twelve months' chemistry; six months' practical chemistry; three months' botany; three months' materia medica; three months' practical pharmacy or apprenticeship; three months' natural history; three months' midwifery; three months' practical midwifery; one course natural philosophy; one course logic.

The candidates must be unmarried, not beyond twenty-five years of age, nor under twenty-one years.

Candidates who have had an university education, and have the degree of A.B. or A.M., as well as that of M.D., will be preferred; but a liberal education, and a competent knowledge of the Greek and Latin languages, are indispensably requisite in every candidate.

The greater the attainments of the candidates the more eligible will they subsequently be deemed for promotion; as

selections to fill vacancies, especially in the higher ranks, will be guided more by reference to such acquirements than to mere seniority.

Although the British schools are specified, it is to be understood that candidates who have received regular education in approved foreign universities or schools will be admitted to examination.

With the exception of practice of physic and clinical medicine by one teacher, candidates must have attended separate lecturers for each branch of medical science.

Before promotion from the rank of assistant-surgeon to any higher rank, every gentleman must be prepared for such other examination as may be ordered before a board of medical officers.

Diplomas, tickets of attendance on lectures, and certificates of regular attendance by each professor or lecturer, must be lodged at this office for examination and registry at least one week before the candidate appears for examination; likewise certificates of moral conduct and character, one of them by the parochial minister if possible. Baptismal certificates are required at the same time, and if the parish register cannot be resorted to, an affidavit from one of the parents, or some near relative who can attest the fact, will be accepted.

The certificate of the teacher of practical anatomy must state the number of subjects or parts dissected by the pupil.

Certificates of lectures and attendance must be from physicians or surgeons of the recognised colleges of the United Kingdom, or of foreign universities.

All candidates for medical appointments are required to be conversant with Cullen's No.ology.

*Note.*—All communications to be pre-paid—or if not, to be forwarded, addressed *outside* to "The Right Honourable the Secretary-at-War," with the words "Army Medical Department" at the left hand corner.

#### NAVAL MEDICAL SERVICE,

*Admiralty Office, Somerset House.*

*Director-General of the Medical Department of the Navy*—Sir William Burnett, K.C.B., K.C.H., M.D., F.R.S.

#### REGULATIONS.

A candidate for entry into the Royal Navy as assistant-surgeon shall make a written application to the Secretary of the Admiralty, on the receipt of which he will be furnished with a printed form to be filled up.

As vacancies occur, the number of candidates required will be ordered to attend at the Admiralty Office, bringing with them the requisite certificates, when they will be examined by a board of medical officers.

The candidate must produce a certificate from one of the Royal Colleges of Surgeons, or from the Faculty of Physicians or Surgeons of Glasgow, of his fitness for the office; also proof of having received a preliminary classical education; of a competent knowledge of Latin; of good moral character; of having served an apprenticeship, or been engaged for not less than six months in practical pharmacy; that his age be not less than twenty years, nor more than twenty-six years;\* that he has actually attended an hospital in London, Edinburgh, Dublin, Glasgow, Aberdeen, Manchester, or Bristol, for eighteen months subsequently to the age of eighteen, in which hospital the average number of patients is not less than 100; that he has been engaged in actual dissections of the human body twelve months; that he has attended lectures, &c., on the following subjects, at established schools of eminence:—

Anatomy, eighteen months; or general anatomy, twelve months, and comparative anatomy, six months.

Surgery, eighteen months; or general surgery, twelve months, and military surgery, six months.

Theory of medicine, six months; practice of medicine, twelve months. (If the lectures on the theory and practice of medicine be given in conjunction, then the period required is eighteen months.)

Clinical lectures (at an hospital as above) on the practice of medicine, six months; practice of surgery, six months.

Chemistry, six months; or lectures on chemistry, three months, and practical chemistry, three months.

*Materia medica*, six months.

Midwifery, six months, accompanied by certificates stating the number of midwifery cases personally attended.

Botany, three months.

*N.B.*—Six months' lectures on pathology, if given at an university where there may be a professorship on that branch of science, will be admitted in lieu of six months' lectures on the practice of medicine.

\* The provision of being unmarried is not now insisted on.

A favourable consideration will be given to those who have obtained the degree of M.D. at either of the Universities of Oxford, Cambridge, Edinburgh, Dublin, Glasgow, London, or Aberdeen; or who, by possessing a knowledge of diseases of the eye, and of any branch of science connected with the profession, such as medical jurisprudence, natural history, natural philosophy, &c., appear to be more peculiarly eligible for admission into the service.

By the rules of the service, no assistant-surgeon can be promoted to the rank of surgeon until he shall have served three years, (one year of which must be in a ship actually employed at sea,) and can produce a diploma from one of the royal Colleges or the Faculty of Physicians and Surgeons.

Candidates who may be admitted into the naval medical service must serve in whatever ships, &c., they may be appointed to; and in the event of their being unable to do so from sea-sickness, their names cannot be continued on the naval medical list, nor can they be allowed half-pay.

By an Admiralty Circular, dated July 17th, 1850, assistant-surgeons are to be divided into two classes.

The first class to consist of all who have completed three years' servitude from the period of their first entry, (one year of which must be served on board a commissioned ship, and the other two may be served in one of the naval hospitals,) and who have passed their examination for surgeon either at home or abroad.

"Assistant-surgeons who have served more than three years, and have passed the examination for surgeon under the above conditions, are to rank next to naval instructors, and are to mess with the ward-room officers, to be allowed cabins when the accommodation and space on board will admit."

The second class of assistant-surgeons to consist of all those who have not served three years, and those who have not passed their examination for surgeon.

First-class assistant-surgeons, who may be serving in small vessels commanded by lieutenants, are to mess in the gun-room with the other officers.

#### EAST INDIA MEDICAL SERVICE,

*East India House, Leadenhall-street.*

*Examining Medical Officer*—Dr. Scott.

#### REGULATIONS FOR THE ADMISSION OF CANDIDATES FOR THE APPOINTMENT OF ASSISTANT-SURGEON.

ALL natural-born subjects of her Majesty may be candidates; they must, however, be between twenty-two and twenty-eight years of age, and of sound bodily health.

They must subscribe and send into Dr. Scott, before the 10th day of December, 1854, a declaration to the following effect:—

"I [Christian and surname at full length], a candidate for employment as an assistant-surgeon in the service of the East India Company, do hereby declare that I was — years of age on the — day of — last, and that I labour under no constitutional disease or physical disability that can interfere with the due discharge of the duties of a medical officer; and I also attest my readiness to proceed on duty to India within three months of receiving my appointment."

This declaration must be accompanied by the following documents:—

1. Proof of age, either by extract from the register of the parish in which the candidate was born, or by his own declaration pursuant to the Act 5th and 6th William IV., cap. 62.

2. A diploma in surgery or a degree in medicine, provided an examination in surgery be required for such degree, from some body competent by law to grant or confer such diploma or decree.

3. A certificate of having attended two courses of lectures, of six months each, on the practice of physic, and of having attended for six months the practice and clinical instruction of the physicians at some hospital containing at least, on an average, 100 in-patients, or of having attended one course of lectures of six months on the practice of physic and clinical instruction for twelve months.

4. A certificate of having attended for three months the practical instruction given at one of the public asylums for the treatment of the insane.

5. A certificate of having attended for three months one of the institutions, or wards of a hospital, especially devoted to the treatment of ophthalmic disease.

6. A certificate of having attended a course of lectures on midwifery, and of having conducted at least six labours.

7. A certificate of having acquired a practical knowledge of cupping.

Candidates may also, at their option, send in certificates of attendance at any hospitals, or on any courses of lectures, in addition to the above. Attendance on a course of military surgery is recommended.

Candidates producing satisfactory certificates will be admitted to an examination on the following subjects:—

1. Surgery in all its departments.
  2. Medicine, including the diseases of women and children, therapeutics, pharmacy, and hygiene.
  3. Anatomy and physiology, including comparative anatomy.
  4. Natural history, including botany and zoology.
- The examination will be conducted—
1. By means of written questions and answers.
  2. By object examinations and experiments, when the subject admits of such tests.
  3. By practical examination at the bed-side of the patient, and by dissections and operations on the dead body.
  4. By *visd voce* examination.

All assistant-surgeons are required to subscribe to the military or medical, and medical retiring funds at the Presidencies to which they may be respectively appointed, and to the Military Orphan Asylum also, if appointed to Bengal.

All assistant-surgeons who shall neglect or refuse to proceed to India under the orders of the Court of Directors, within three months from the date of their appointments, will be considered as having forfeited them, unless special circumstances shall justify a departure from this regulation.

Candidates may apply to Dr. Scott, 13, Stratton-street, for further information, if needed.

N.B.—The certificates and notices as to examination herein contained apply only to the examination to be held in January next.

Regulations regarding the requirements of candidates for future examinations will be issued after the first examination.

## Metropolitan Hospitals & Medical Schools.

[In the following list, the hospitals and medical schools of the metropolis are placed in alphabetical order.]

### ST. BARTHOLOMEW'S HOSPITAL,

*Smithfield.*

*Physicians*—Dr. Hue, Dr. Roupell, Dr. Burrows, and Dr. F. J. Farre.

*Surgeons*—Mr. Lawrence, Mr. Stanley, Mr. Lloyd, and Mr. Skey.

*Assistant-Physicians*—Dr. Jeaffreson, Dr. Black, Dr. Baly, and Dr. Kirkes.

*Assistant-Surgeons*—Mr. Wormald, Mr. Paget, Mr. McWhinnie, and Mr. Coots.

*Physician-Accoucheur*—Dr. West.

MEDICAL PRACTICE.		SURGICAL PRACTICE.	
Six months ... ..	£10 10	Six months ... ..	£15 15
Nine months ... ..	12 12	Twelve months ...	21 0
Eighteen months ...	15 15	Three years ... ..	26 5
An unlimited period	31 10	An unlimited period	31 10

The hospital contains 650 beds, of which 420 are allotted to surgical cases and diseases of the eye, and 230 to medical cases and diseases of women. In 1852, 88,954 patients were relieved, including 5763 in-patients, 19,446 out-patients, and 63,745 casualties.

The clinical clerks to the physicians are elected from the most diligent students.

Dresserships, three months, £12 12s.; six months, £18 18s.; twelve months, £26 5s.

The entrance to the medical or surgical practice confers the right of attending the courses of clinical lectures by the physicians or surgeons.

Clinical lectures are delivered weekly during both the winter and the summer sessions. On medicine, by Dr. Roupell, Dr. Burrows, and Dr. Farre. On surgery, by Mr. Lawrence, Mr. Stanley, Mr. Lloyd, and Mr. Skey.

Examinations after death are made in the Pathological Theatre, at twelve. Demonstrator of morbid anatomy, Mr. Callender, registrar to the hospital.

Surgical operations on Saturday, at half-past one.

Cases in midwifery are attended, in out-patients of the hospital, by the students of the midwifery-class, under the superintendence of the physician accoucheur. More than 400 cases are thus attended annually.

The chemical laboratory is open daily, from ten to four

o'clock, for a special class of laboratory students:—Fee for one month, £3 3s.; for three months, £6 6s.

All students of the first year are examined weekly in the several subjects of their studies by the tutor, Mr. Savory.

### ST. BARTHOLOMEW'S COLLEGE.

#### WINTER SESSION.

The Introductory Address will be delivered by Dr. Burrows, on Monday, October 2nd, at seven P.M.

*Medicine*: Dr. George Burrows, Monday, Wednesday, and Friday, at half-past three. One course or session, £5 5s.; unlimited, £7 7s.

*Descriptive and Surgical Anatomy*: Mr. Skey, daily, except Saturday, at half-past two. Half session, £5 5s.; whole session, £7 7s.; unlimited, £10 10s.

*General and Morbid Anatomy and Physiology*: Mr. Paget, daily, at nine in the morning. One course or half session, £5 5s.; whole session, £7 7s.; unlimited, £10 10s.

*Practical Anatomy*. Demonstrators: Mr. Holden and Mr. Holmes Coots, daily, from half-past ten to half-past two. The dissecting-rooms are open daily, from seven till four.

*Surgery*: Mr. Lawrence, Monday, Wednesday, and Thursday, at seven o'clock in the evening. One course or session, £5 5s.; a second course, £3 3s.; unlimited, £7 7s.

*Chemistry*: Mr. Stenhouse, Monday, Wednesday, and Friday, at ten. One course, £5 5s.; unlimited, £7 7s.

#### SUMMER SESSION.

*Materia Medica and Therapeutics*: Dr. Roupell, Tuesday, Wednesday, Thursday, and Friday, at half-past two. One course or session, £5 5s.; unlimited, £7 7s.

*Midwifery and the Diseases of Women and Children*: Dr. West, daily, (except Saturday,) at half-past three. One course, £4 4s.; unlimited, £6 6s.

*Botany*: Dr. F. J. Farre, Tuesday, Thursday, and Saturday, at nine. One course, £3 3s.; unlimited, £4 4s. Herborizing excursions during the course.

*Practical Chemistry*: Mr. Stenhouse, assisted by Mr. Abel, and Mr. R. V. Tuson, Monday, Tuesday, Thursday, and Friday, from ten till one. One course, £2 2s.; unlimited, £3 3s.

*Forensic Medicine*: Dr. Baly, Monday, Wednesday, and Friday, at nine. One course, £3 3s.; unlimited, £4 4s.

*Comparative Anatomy*: Mr. McWhinnie, Monday, Wednesday, and Friday, at ten. One course, £2 2s.; unlimited, £3 3s.

*Natural Philosophy*: Mr. R. Martin, M.B., Wednesday and Saturday, at twelve. One course, £2 2s.

Entrance fee to all the lectures required by the Royal Colleges of Physicians and Surgeons, and the Society of Apothecaries, £52 10s.; to all the Lectures and Hospital Practice necessary for the same examinations, £94 10s.; unlimited entrance to all the lectures, £63. These fees may be paid in two or in three portions at the commencement of the first winter and summer and second winter sessions.

### CHARING-CROSS HOSPITAL,

*West Strand, near Charing-cross.*

*Consulting Physician*—Dr. W. Shearman.

*Physicians*—Dr. Golding and Dr. Chowne.

*Assistant-Physician*—Dr. Rowland.

*Surgeons*—Mr. Hancock and Mr. Avery.

*Assistant-Surgeon*—Mr. E. Canton.

MEDICAL PRACTICE.		SURGICAL PRACTICE.	
Six months ... ..	£10 10	Six months ... ..	£10 10
Full period required ...	15 15	Full period required ...	15 15
Full period to both medical and surgical practice,	£26 5s.		

The physicians and surgeons visit the wards daily, (Sundays excepted,) between one and two o'clock.

Out-patients are seen and prescribed for at the hospital daily, (Sundays excepted,) between twelve and two o'clock.

Medical and surgical clinical lectures are given weekly by the physicians and surgeons of the hospital.

### CHARING-CROSS MEDICAL AND SURGICAL SCHOOL.

#### WINTER SESSION.

The Introductory Address will be delivered by Dr. W. D. Chowne, on Monday, October 2nd, at three P.M.

*Chemistry*: Mr. H. H. Lewis, Tuesday, Thursday, and Saturday, at half-past nine. One session, £5 5s.; two sessions, £6 6s.; unlimited, £7 7s.

*Anatomy*: Mr. E. Canton, daily, (except Saturday,) at half

past eight A.M. One session, £4 4s.; two sessions, £6 6s.; unlimited, £7 7s.  
**Demonstrations and Dissections:** Mr. Goldsbro, daily, at three. One session, £2 2s.; two sessions, £3 3s.; unlimited, £4 4s.  
**Hospital Practice:** daily, from twelve to two.  
**Physiology and Pathology:** Dr. Hyde Salter, daily, (except Saturday,) at half-past three. One session, £4 4s.; two sessions, £6 6s.; unlimited, £7 7s.  
**Medicine:** Dr. Chowne and Dr. Rowland, Monday, Wednesday, and Friday, at half-past four. One session, £4 4s.; two sessions, £6 6s.; unlimited, £7 7s.  
**Surgery:** Mr. Hancock, Tuesday, Thursday, and Friday, at half-past two. One session, £3 3s.; two sessions, £5 5s.; unlimited, £6 6s.

## SUMMER SESSION.

**Practical Chemistry in the Laboratory:** Mr. H. H. Lewis, Tuesday, Thursday, and Saturday. Fee, £2 2s.  
**Materia Medica and Therapeutics:** Dr. Steggall and Dr. Willshire, daily, (except Monday,) at nine A.M. One session, £4 4s.; two sessions, £5 5s.; unlimited, £6 6s.  
**Midwifery, and the Medical Treatment of Women and Children:** Dr. Chowne and Mr. Hird, Monday, Tuesday, Thursday, and Friday, at two. One session, £3 3s.; two sessions, £5 5s.; unlimited, £6 6s.  
**Botany:** Mr. Headland, daily, at ten. One session, £2 2s.; two sessions, £3 3s.; unlimited, £4 4s.  
**Medical Jurisprudence:** Dr. G. Birkett and Mr. Hird, Monday, Wednesday, and Friday, at three. One session, £2 2s.; two sessions, £3 3s.; unlimited, £4 4s.

Demonstrations in operative surgery, applications of bandages, splints, &c., by Mr. Hancock.

Attendance is given in the dissecting-room by the teacher of anatomy and the demonstrator.

General fee for all the lectures required by the College of Surgeons and Society of Apothecaries, £45; with practical chemistry, £47 2s.

Free Scholarships are granted in some cases, the regulations respecting which, and forms of application, are to be obtained by the candidates personally at the Secretary of the hospital.

Medical officers of the army and navy are admitted to the practice and lectures at this hospital and school, upon presenting a recommendation from the heads of their respective departments.

## ST. GEORGE'S HOSPITAL,

Hyde-park Corner.

**Physicians**—Dr. J. A. Wilson, Dr. Nairne, Dr. Page, and Dr. Bence Jones.

**Assistant-Physicians**—Dr. Pitman and Dr. Fuller.

**Obstetric Physician**—Dr. R. Lee.

**Surgeons**—Mr. Caesar Hawkins, Mr. Cutler, Mr. Tatum, and Mr. H. C. Johnson.

**Assistant-Surgeons**—Mr. P. Hewett and Mr. G. D. Pollock.

## MEDICAL PRACTICE.

Six months ... ..	£8 8
Twelve months (or the period required by the Hall) ... ..	16 16
Unlimited ... ..	25 4
Fee to the apothecary ...	1 1

## SURGICAL PRACTICE.

Six months ... ..	£15 15
Twelve months (or the period required by the College) ... ..	21 0
Unlimited ... ..	52 10

The hospital contains 350 beds.

The physicians and surgeons attend daily at one o'clock.

Operations on Thursdays, at one o'clock.

Patients with diseases of the eye are treated by Mr. Tatum and Mr. H. C. Johnson, on Mondays and Fridays, at one o'clock.

Clinical lectures delivered by the physicians and surgeons on Tuesdays and Saturdays, at a quarter before two, during the winter and summer sessions.

Instruction in practical pharmacy, in the laboratory and dispensary of the hospital. Terms:—Six months, £12 12s.; one year, £15 15s.

The pupils attending the medical and surgical practice may become, when qualified, clinical clerks to the several physicians and surgeons. The dresser of the surgeon of the week boards at the hospital, free of expense.

Perpetual pupils are eligible to be assistant house-surgeons for six months, and house-surgeon for twelve months, (without additional fee,) when properly qualified for the office.

Library subscription for the first year, £1 1s.; for every subsequent year, 5s.

## ST. GEORGE'S MEDICAL AND SURGICAL SCHOOL.

## WINTER SESSION.

**Anatomy, General, and Physiology:** Mr. Athol Johnson, Monday, Tuesday, Thursday, and Friday, at ten A.M. One course, £6 6s.; perpetual, £8 8s.

**Anatomy, Descriptive and Surgical:** Mr. Prescott Hewett, Mr. Pollock, and Mr. Henry Gray, daily, (except Saturday,) at a quarter before three. One course, £6 6s.; perpetual, £8 8s.

**Practical Anatomy:** Students will be directed in their studies during several hours daily, by the demonstrators, under the superintendence of the lecturers.

**Chemistry:** Mr. H. M. Noad, Tuesday, Thursday, and Saturday, at eleven. One course, £6 6s.; perpetual, £8 8s.

**Medicine:** Dr. Nairne and Dr. Page, Monday, Wednesday, and Friday, at nine. One course, £5 5s.; perpetual, £6 6s.

**Surgery:** Mr. Tatum, Monday, Wednesday, and Friday, at twelve. One course, £4 4s.; perpetual, £6 6s.

## SUMMER SESSION.

**Materia Medica:** Dr. Pitman, daily, (except Saturday,) at eleven. One course, £5 5s.; perpetual, £6 6s.

**Midwifery:** Dr. R. Lee, daily, at nine. One course, £4 4s.; perpetual, £6 6s.

**Botany:** Mr. Henfrey, daily, (except Saturday,) at twelve. One course, £3 3s.; perpetual, £4 4s.

**Medical Jurisprudence:** Dr. Fuller, Monday, Wednesday, Thursday, and Friday, at ten A.M. One course, £3 3s.; perpetual, £4 4s.

**Practical Chemistry, (including use of materials):** Mr. Noad, daily, at half-past two. Fee for the course, £4 4s.

The whole of the lectures and hospital practice required by the College of Surgeons of England and Society of Apothecaries of London, may be attended, on payment of forty guineas at the commencement of the first year; forty guineas at the commencement of the second year; and twelve guineas at the commencement of the third year. The payment for the year will admit the pupil to all the lectures, and to the hospital practice required, for that year only. Registration fee, one guinea.

**SCHOLARSHIPS AND PRIZES.**—There will be examinations for three scholarships in July, 1855: of the value of £30, £20, and £10 respectively, and tenable for two years; the subjects of examination will be anatomy, chemistry, and materia medica.

Candidates must be matriculated students, who have been studying in the hospital school for one winter and one summer session.

A student elected to a scholarship will be required to continue his studies at the hospital during the whole period in which he holds the scholarship, unless with leave given by the medical officers to be absent.

**CURATOR OF THE PATHOLOGICAL MUSEUM.**—A curator is appointed annually by the Weekly Board, on the recommendation of the Medical School Council, with a salary of £50 per annum.

**REGISTRARS.**—Two registrars are appointed annually by the Weekly Board, on the recommendation of the Medical School Council, each with a salary of £20 per annum.

## GUY'S HOSPITAL,

Southwark.

**Consulting Physician**—Dr. Bright.

**Physicians**—Dr. Addison, Dr. Barlow, and Dr. Hughes.

**Assistant-Physicians**—Dr. G. Owen Rees, Dr. Gull, and Dr. Habershon.

**Surgeons**—Mr. Cock, Mr. Hilton, and Mr. Birkett.

**Assistant-Surgeons**—Mr. Alfred Poland and Mr. T. Callaway.

**Obstetric Physicians**—Dr. Lever and Dr. Oldham.

**Surgeon-Dentist**—Mr. T. Bell.

**Surgeon of the Eye Infirmary**—Mr. France.

**Apothecary**—Mr. Stocker.

This hospital contains 549 beds. The day for general admission of patients is Wednesday, at ten o'clock; but accidents and cases of urgent disease are received at all hours. Casual patients are dressed at the surgery from ten to two daily. Out-patients prescribed for by the assistant-physicians on Mondays, Wednesdays, and Fridays, at twelve; and a day is set apart for the special study and treatment of cutaneous diseases. Diseases of women are attended to on Thursdays and Saturdays, at twelve; and ophthalmic cases on Tuesdays and

**Fridays**; at twelve. The physicians and surgeons visit the wards, and give clinical instruction, daily, at one. Mr. France attends the eye wards on Mondays and Fridays, at one. Patients in the obstetric wards are also prescribed for at one, daily. In the *Lying-in Charity* many hundred women are annually attended by students. The electricity room is open daily at three, under the superintendence of Dr. Gull. Students are instructed in the use of the microscope.

Students must give satisfactory testimony as to their education and conduct.

**FEES**.—£40 for the first year, £40 for the second, and £10 for every succeeding year of attendance. The sum of £100 in a single payment entitles the student to a perpetual ticket.

Dressers, clinical clerks, assistants, resident obstetric clerks, and dressers in the eye ward, are selected from those students who have attended a second year, and have most satisfactorily distinguished themselves.

The dressers and obstetric residents live in the hospital, and are provided with commons during their weeks of residence. The cases in the general wards are divided amongst the junior students, who act as clerks to the physicians and surgeons.

Dr. Odling and Dr. Pavy superintend the studies of pupils preparing to graduate.

## GUY'S MEDICAL AND SURGICAL SCHOOL.

### WINTER SESSION.

The Introductory Address will be given by Mr. Birkett, on Monday, October 2nd, 1854, at two o'clock.

**Anatomy**: Mr. Poland and Mr. Callaway, daily, at two.

**Physiology and General Pathology**: Dr. Gull, Tuesday, Wednesday, Thursday, and Saturday, at nine.

**Demonstrations in Anatomy**: Dr. Pavy and Mr. Cooper Foster, daily.

**Demonstrations in Morbid Anatomy**: Dr. Habershon, daily, at half-past two.

**Chemistry**: Dr. Alfred S. Taylor, Tuesday, Thursday, and Saturday, at eleven.

**Medicine**: Dr. Addison, Monday, Wednesday, and Friday, at half-past three.

**Surgery**: Mr. Hilton and Mr. Birkett, Tuesday, Thursday, and Saturday, at half-past three.

**Experimental Philosophy**: Dr. Odling, Tuesday, at seven.

**Moral Philosophy**: Rev. T. H. Bullock, Chaplain to the Hospital.

**Clinical Medicine**: Dr. Addison, Dr. Barlow, and Dr. Hughes.

**Clinical Surgery**: Mr. Cock, Mr. Hilton, and Mr. Birkett.

**Clinical Lectures on Midwifery and Diseases of Women**: Dr. Lever and Dr. Oldham.

### SUMMER SESSION.

**Demonstrations on Cutaneous Diseases**: Dr. Addison and Dr. Gull, Monday, at one.

**Materia Medica**: Dr. Owen Rees, Tuesday, Thursday, and Saturday, at two.

**Clinical Medicine**: Dr. Owen Rees, Dr. Gull, and Dr. Habershon.

**Clinical Surgery**: Mr. Poland and Mr. Callaway.

**Dental Surgery**: Mr. Bell and Mr. Salter.

**Midwifery**: Dr. Lever and Dr. Oldham, daily, at a quarter to nine.

**Medical Jurisprudence**: Dr. Alfred Taylor, Tuesday, Thursday, and Saturday, at ten.

**Ophthalmic Surgery**: Mr. France, Wednesday and Friday, at three.

**Botany**: Mr. Johnson, Tuesday, Thursday, and Saturday, at half-past eleven.

**Practical Chemistry**: Dr. Odling, Monday, Wednesday, and Friday, from eleven to three.

## KING'S COLLEGE HOSPITAL,

Portugal-street, Lincoln's Inn-fields.

**Consulting Physicians**—Dr. Watson and Dr. Ferguson.

**Physicians**—Dr. Budd and Dr. Todd.

**Physician-Accoucheur**—Dr. Arthur Farre.

**Physician to Out-patients**—Dr. W. A. Guy.

**Assistant-Physician**—Dr. George Johnson.

**Surgeons**—Mr. Ferguson and Mr. Partridge.

**Assistant-Surgeons**—Mr. W. Bowman and Mr. Henry Lee.

**Surgeon-Dentist**—Mr. S. Cartwright, jun.

### HOSPITAL FEES.

Perpetual admission to the Medical and Surgical Practice:—

For Matriculated Students of King's College ... £31 10

For Pupils who are not Matriculated Students... 36 15

#### MEDICAL PRACTICE.

Three months ... .. £6 6

Six months ... .. 10 10

Twelve months } ... 15 15

Eighteen months } ... 15 15

Perpetual ... .. 21 0

#### SURGICAL PRACTICE.

Three months ... .. £10 10

Six months ... .. 15 15

Twelve months } 21 0

Twenty-one months } 21 0

Perpetual ... .. 26 5

Registration fee, (to be paid to the Secretary at King's College Hospital,) 10s. 6d.

Hospital attendance, daily, from half-past one to three, except on Wednesdays, when the hospital will be visited at two o'clock, to allow the students to attend the Principal's lecture.

Dr. Arthur Farre, Physician-Accoucheur, attends at half-past eleven, on Tuesday, Thursday, and Saturday.

Clinical lectures are delivered at half-past one on alternate

Tuesdays ... .. by Dr. Todd | Mondays ... by Mr. Partridge

Fridays ... .. by Dr. Budd | Thursdays... by Mr. Ferguson

The physician's assistant and clinical clerks, the house-surgeon, and dressers, are selected by examination from amongst those matriculated students of the College who are pupils of the hospital. No fee is paid for any of these appointments.

The hospital accommodates 120 in-patients.

## KING'S COLLEGE MEDICAL DEPARTMENT,

Somerset House.

The session will open with an Introductory Lecture by Dr. Royle, on Monday, October 2nd, at two P.M.

**Anatomy, Descriptive and Surgical**: Mr. Partridge, daily, at nine. Demonstrators, Mr. Henry Lee and Mr. J. Wood.

One sessional course, £8 8s.; unlimited, £9 9s.

**Physiology, General and Morbid Anatomy**: Mr. Bowman, Dr. Beale, Monday, Wednesday, Thursday, and Friday, at four o'clock. One course, £8 8s.; unlimited, £9 9s.

**Chemistry**: Dr. W. A. Miller, daily, (excepting Saturday,) at three. Demonstrator, Mr. C. L. Bloxam. One course, £7 7s.; unlimited, £9 9s.

**Medicine**: Dr. Budd, Tuesday, Thursday, and Saturday, at five. One course, £5 5s.; unlimited, £7 7s.

**Surgery**: Mr. Ferguson, Monday, Wednesday, and Friday, at five. One course, £4 4s.; unlimited, £6 6s.

### SUMMER SESSION.

**Midwifery**: Dr. A. Farre, Monday, Wednesday, Thursday, and Friday, at four. One course, £4 4s.; unlimited, £6 6s.

**Materia Medica and Therapeutics**: Dr. Forbes Royle, Tuesday, Wednesday, Thursday, and Friday, at a quarter-past ten. One course, £5 5s.; unlimited, £6 6s.

**Botany**: , Tuesday, Wednesday, Thursday, and Friday, at nine. One course, £3 3s.; unlimited, £4 4s.

**Forensic Medicine**: Dr. Guy, Monday, Tuesday, Wednesday, and Friday, at a quarter-past twelve. One course, £3 3s.; unlimited, £4 4s.

**Practical Chemistry**: Mr. J. E. Bowman, daily, at a quarter-past ten. One course, £4 4s.; unlimited, £8 8s.

**Comparative Anatomy**: Mr. Rymer Jones, Monday, Wednesday, and Friday, at a quarter-past ten. One course, £3 3s.; unlimited, £4 4s.

A resident medical tutor assists the students in the subjects of the lectures of their first and second years.

The course of study required by the College and Hall may be pursued at King's College on payment of £93 9s.

This payment may be made either in one sum upon matriculation; or in two equal sums—the one at the commencement of the winter session, October 1st, and the other not later than the 21st of January.

The following fees must be paid at the time of matriculation:

Matriculation fee ... .. £1 1 0

Library fee ... .. 1 1 0

Subscription to the Scholarship Fund... 1 1 0

Cap and Gown ... .. 1 10 0

Calendar ... .. 0 2 6

£4 15 6

Fees for admission to the laboratory class of analytical chemistry—for one month, £4 4s.; for three months, £10 10s. for six months, £18 18s.; for nine months, £26 5s.

Fee for the medical tutor—to resident students, £2 2s. for each academical year; to non-resident students, £3 3s. All resident students are required to attend the medical tutor during their first year.

Students are matriculated or occasional. Matriculated students are those who receive their entire medical education at King's College; they wear the College cap and gown. Occasional students are those who attend only the lectures of particular professors.

#### ENDOWMENTS.

1. WARNEFORD SCHOLARSHIPS.—*Class I*: Two of £25, for three years, given every October to such new students in Medicine who shall pass the best examination in Divinity, Classics, Mathematics, History and the Modern Languages.—*Class II*: Two of £25, for two years, given every July to such resident second year students who shall pass the best examination in Divinity and Hospital Practice.

2. MEDICAL SCHOLARSHIPS, given annually.—One of £40 for students of the third and fourth year, tenable for three years; one of £30 for students of the second year, tenable for two years; and three of £20, for students of the first year, tenable for two years.

3. DANIELL SCHOLARSHIP.—It is open to every student of the College; is of the annual value of £20, tenable for two years, and is given every second year for the best series of researches in Chemistry made in the laboratory of the College since the last award.

### THE LONDON HOSPITAL,

Whitechapel.

*Physicians*—Dr. Little, Dr. Fraser, and Dr. Davies.

*Assistant-Physicians*—Dr. Parker, Dr. Gibbon, and Dr. A. Clark.

*Obstetric Physician*—Dr. Ramsbotham.

*Surgeons*—Mr. Luke, Mr. Adams, and Mr. Curling.

*Assistant-Surgeons*—Mr. Critchett, Mr. N. Ward, and Mr. Wordsworth.

This hospital contains 400 beds. Accidents received and treated in 1853, 10,764.

One of the physicians and one of the surgeons attend daily, the former at eight A.M., the latter at one P.M.; and one of the assistant-physicians and one of the assistant-surgeons daily, at one.

Dr. Ramsbotham attends on Wednesdays and Saturdays, at one.

Surgical operations on Fridays, at one.

Post-mortem examinations at two, superintended by Dr. Gibbon.

**FEES.—MEDICAL PRACTICE:** For six months, £6 6s.; for period required by Apothecaries' Hall, £11 11s.

**SURGICAL PRACTICE:** For twelve months, including six months' dressership, £12 12s.; eighteen months, including twelve months' dressership, £18 18s.; three years, including twelve months' dressership, £26 5s.; twelve months' additional dressership, during the above three years, £5 5s.; twelve months' dressership, after expiration of the above three years, £8 8s.

The pupils enter and dress under all the surgeons. Two pupils, in rotation, remain in the hospital day and night for a week, and are provided with commons.

Three dresserships for twelve months are given annually to the pupils of the school, each pupil being previously required to dress the out-patients for one year.

Two house-surgeons are elected every three months, without any additional fee. They reside in the hospital, and are provided with commons.

### LONDON HOSPITAL MEDICAL AND SURGICAL COLLEGE.

The winter session will commence on Monday, October 2nd, 1854, with an introductory lecture by Dr. Little, at three o'clock.

General fee for attendance on the medical and surgical practice, and all the lectures, qualifying for the examinations of the University of London, Royal College of Surgeons, and Apothecaries' Hall, £88 4s., payable in two instalments of £44 2s. each, at the commencement of the first two sessions of attendance. Fee perpetual to lectures alone, £50.

#### WINTER SESSION.

Medicine: Dr. Little, Monday and Thursday, at four; Wed-

nesday and Saturday, at eight in the morning. One session, £4 4s.; unlimited, £7 7s.

**Surgery:** Mr. Curling and Mr. Critchett, Monday, Wednesday, and Friday, at three. One session, £4 4s.; perpetual, £6 6s. Descriptive and Surgical Anatomy: Mr. John Adams, daily, (except Wednesday,) at a quarter past nine A.M. One session, £5 5s.; unlimited, £10 10s.

**General Anatomy and Physiology:** Dr. W. B. Carpenter, Tuesday and Thursday, at three. One session, £3 3s.; perpetual, £5 5s.

**Practical Anatomy:** Mr. N. Ward, Mr. Wordsworth, and Mr. P. L. Gowland. Demonstrations, on alternate days, at a quarter past eleven, and on Saturday, at three. One session, £5 5s.; unlimited, £10 10s. Attendance in the dissecting-room daily, from ten till three or four.

**Chemistry:** Dr. Henry Letheby, Monday, Wednesday, and Friday, at half-past ten. One session, or unlimited, £7 7s.

**Pathological Histology:** Dr. A. Clark, Monday and Friday, at twelve.

**Anatomy and Pathology of the Teeth, and Dental Surgery:** Mr. H. J. Barrett, at seven P.M.

#### SUMMER SESSION.

**Midwifery, and Diseases of Women and Children:** Dr. F. H. Ramsbotham, Monday, Tuesday, Thursday, and Friday, at three. One session, £4 4s.; unlimited, £6 6s.

**Forensic Medicine:** Dr. F. H. Ramsbotham and Dr. Henry Letheby, daily, (except Saturday,) at half-past nine. One course, £3 3s.; two courses, or unlimited, £4 4s.

**Materia Medica and Therapeutics:** Dr. Herbert Davies, Tuesday, Wednesday, and Friday, at half-past eight. One session, £3 3s.; unlimited, £4 4s.

**Practical Chemistry:** Dr. Henry Letheby, Tuesday, Thursday, and Saturday, at half-past ten A.M. To students of the hospital, one course, £2 2s.; others, £3 3s.

**Botany:** Mr. Robert Bentley, Monday, Wednesday, and Friday, at eleven; examinations and herborizing excursions on Saturday. One course, £3 3s.; two courses, or perpetual, £4 4s.

**Practical Histology and Use of the Microscope:** Dr. A. Clark, Wednesday and Saturday, at ten.

**Comparative Anatomy:** Mr. H. Coles, twice weekly, at twelve.

### ST. MARY'S HOSPITAL,

Cambridge-place, Paddington.

*Physicians*—Dr. Alderson, Dr. Chambers, and Dr. Sibson.

*Surgeons*—Mr. Coulson, Mr. Lane, and Mr. Ure.

*Assistant-Physicians*—Dr. Handfield Jones, Dr. Sieveking, and Dr. Markham.

*Assistant-Surgeons*—Mr. Spencer Smith, Mr. Haynes Walton, and Mr. James Lane.

*Physician-Accoucheur*—Dr. Tyler Smith.

*Surgeon-Accoucheur*—Mr. I. Baker Brown.

*Ophthalmic Surgeon*—Mr. White Cooper.

*Aural Surgeon*—Mr. Toynbee.

*Dental Surgeon*—Mr. Naamyth.

*Medical Registrar*—Dr. J. S. Burdon Sanderson.

*Surgical Registrar*—Mr. Graily Hewitt, M.B.

This hospital contains 150 beds, 85 of which are devoted to surgical, and 65 to medical, cases. These include wards for diseases of women, ophthalmic cases, and aural cases. In the maternity department, 218 poor married women were delivered at their own homes during the past year.

#### MEDICAL PRACTICE.

Three months	£5 5
Six months	7 7
Twelve months	12 12
Eighteen months	15 15
Perpetual	21 0

#### SURGICAL PRACTICE.

Six months	£9 9
Twelve months, (or period required by the College of Surgeons)	21 0
Perpetual	32 10

The in-patients are visited daily by the physicians and surgeons at one o'clock.

Lectures on clinical medicine will be regularly delivered by Dr. Alderson, and on clinical surgery by Mr. Ure; and occasionally by the other medical officers.

The out-patients are seen daily at half-past twelve by the assistant-physicians and assistant-surgeons.

Surgical operations on Wednesdays, at half-past one.

Post-mortem examinations by Dr. Markham at two.

The physician-accoucheur attends on Mondays and Thursdays; the surgeon-accoucheur and the ophthalmic surgeon on Tuesdays and Saturdays; the aural surgeon on Mondays and

Thursdays: all at half-past one. The surgeon-dentist attends on Mondays and Thursdays at half-past nine.

Students may receive private instruction in practical pharmacy in the Laboratory and Dispensary. Fee for six months, £6 6s.; twelve months, £10 10s.

There are three resident medical officers, who board in the hospital, and are appointed for eighteen months; two non-resident medical officers; a medical and a surgical registrar: all of whom are appointed by the Weekly Board of Governors, on the recommendation of the Medical Committee. Clinical clerks and dressers selected from the best qualified students. All the above offices are open to competition amongst the qualified perpetual pupils of the hospital, without extra fee.

### ST. MARY'S HOSPITAL MEDICAL SCHOOL.

This school will be opened on Monday, October 2nd, 1854, at half-past two, with an introductory address by Dr. Alderson.

#### WINTER SESSION.

Anatomy and Physiology: Mr. Lane and Dr. Handfield Jones, daily, at half-past two. One session, £6 6s.; unlimited, £8 8s.

Descriptive and Surgical Anatomy: Mr. Haynes Walton and Mr. James Lane, daily, at a quarter-past ten. One session, £6 6s.; unlimited, £8 8s.

Practical Anatomy and Dissections: Demonstrator, Mr. T. K. Hornidge.

Pathological Anatomy: Dr. Markham, Saturday, at half-past eleven. One session, £2 2s.; unlimited, £3 3s.

Chemistry: Dr. Albert J. Bernays, Tuesday, Thursday, and Saturday, at nine. One session, £5 5s.; unlimited, £7 7s.

Medicine: Dr. Chambers and Dr. Sibson, Monday, Wednesday, and Friday, at nine. One session, £4 4s.; unlimited, £6 6s.

Surgery: Mr. Coulson and Mr. Spencer Smith, Monday, Wednesday, and Friday, at a quarter to four. One session, £4 4s.; unlimited, £6 6s.

Clinical Medicine: Dr. Alderson, Monday, at a quarter to two. One session, £3 3s.; unlimited, £4 4s.

Clinical Surgery: Mr. Ure, Thursday, at a quarter to two. One session, £3 3s.; unlimited, £4 4s.

#### SUMMER SESSION.

Botany: Dr. J. S. B. Sanderson, Tuesday, Thursday, and Saturday, at ten. One session, £3 3s.; unlimited, £4 4s.

Materia Medica and Therapeutics: Dr. Sieveking, daily, (except Saturday,) at twelve. One session, £4 4s.; unlimited, £6 6s.

Practical Chemistry: Dr. A. J. Bernays, Monday, Wednesday, and Friday, at ten. One session, £2 2s.; unlimited, £3 3s.

Midwifery, and Diseases of Women and Children: Dr. Tyler Smith and Mr. I. B. Brown, daily, (except Saturday,) at a quarter to nine A.M. One session, £4 4s.; unlimited, £6 6s.

Medical Jurisprudence: Mr. Ancell, Monday, Wednesday, and Friday, at a quarter to four. One session, £3 3s.; unlimited, £4 4s.

Military Surgery, &c.: Dr. James Bird, Monday, Wednesday, and Friday, at half-past two. One session, £2 2s.; unlimited, £3 3s.

Ophthalmic Surgery: Mr. White Cooper, Tuesday and Saturday, at half-past two. One session, £2 2s.; unlimited, £3 3s.

Aural Surgery: Mr. Toynbee, Thursday, at half-past two. One session, £2 2s.

Fee to all the lectures required for the examinations at the Royal Colleges of Physicians and Surgeons, and the Society of Apothecaries, £52 10s. Fee to the hospital practice required by the Royal College of Surgeons and the Society of Apothecaries, £36 15s. Fee as a perpetual pupil for unlimited attendance on the hospital practice, and on every course of lectures delivered in the school, £105. The above general entrance fees may be paid in instalments.

### MIDDLESEX HOSPITAL,

*Charles-street, Berners-street.*

Physicians—Dr. Francis Hawkins, Dr. Crawford, and Dr. Seth Thompson.

Physician-Accoucheur—Dr. Frere.

Assistant-Physicians—Dr. Stewart and Dr. Goodfellow.

Surgeons—Mr. Shaw, Mr. de Morgan, and Mr. Moore.

Assistant-Surgeon—Mr. Henry.

Surgeon-Dentist—Mr. Tomes.

Apothecary—Mr. Corfe.

Registrar—Mr. Sibley.

#### MEDICAL PRACTICE.

Three months ...	£6 6
Six months ...	10 10
Eighteen months ...	15 15
Unlimited ...	21 0

#### SURGICAL PRACTICE.

Six months ...	£10 10
Twelve months ...	12 12
Three years ...	18 18
Unlimited ...	21 0

Fee to apothecary, £1 1s.; to secretary, 5s.

Fee for the entire periods required by the College of Surgeons and Apothecaries' Company, £30; this includes the fees of the apothecary and secretary.

Hospital attendance from one to three daily. Operations on Thursdays, at half-past twelve.

Clinical lectures four days weekly, at half-past twelve.

The hospital receives 300 in-patients, and contains wards appropriated to the admission of cases of syphilis, of cancer, and of uterine disease. 2192 in-patients were admitted during the past year. The number of out-patients treated was 11,675.

Clinical clerks and dressers are selected by the physicians and surgeons of the hospital from the most deserving pupils.

House-surgeons are elected half-yearly from the dressers, fee £21, and are provided with board and residence in the hospital, free of expense.

Out-patients attended on four mornings in the week by the assistant-physicians and assistant-surgeon.

Upwards of 800 cases of labour were attended under the direction of the physician-accoucheur during the last year. Students are furnished with cases under his superintendence. Out-patients with uterine and infantile diseases are seen by the physician-accoucheur on Wednesdays and Saturdays, at twelve.

Diseases of the eye attended by Mr. Moore on Tuesdays, Thursdays, and Saturdays, at nine.

Instruction on diseases of the teeth, and the operations connected with them, on Tuesdays, Thursdays, and Saturdays, at nine.

### MIDDLESEX HOSPITAL MEDICAL AND SURGICAL SCHOOL.

#### WINTER SESSION.

Physiology and General Anatomy: Mr. De Morgan, Monday, Wednesday, and Friday, at three. One session, £4; perpetual, £6.

Anatomy, Descriptive and Surgical: Mr. Moore, daily, at twelve. One session, £8; perpetual, £11.

Practical Anatomy: Mr. T. W. Nunn and Dr. Van der Byl. Demonstrations, Tuesday and Thursday, at three o'clock. One session, £2 2s.; perpetual, £3 3s.

The dissecting-room is open from eight to five o'clock, daily, and it is announced that attendance will be given there for six hours daily.

Fee for attendance on a single course of Anatomy, Physiology, Demonstrations, and Dissections, £8 8s.; perpetual, £15.

Chemistry: Mr. Thomas Taylor and Mr. Heisch, Monday, Wednesday, and Friday, at eleven. One session, £6; perpetual, £8.

Medicine: Dr. Crawford and Dr. Seth Thompson, Monday, Wednesday, and Friday, at nine. One session, £4; perpetual, £6.

Surgery: Mr. Shaw, Tuesday, Thursday, and Saturday, at nine. One session, £4; perpetual, £6. Fee for two courses, £5 5s.

Morbid Anatomy: Mr. Henry, Monday, at half-past ten. One session, £2 2s.; unlimited, £3 3s.

Practical Pharmacy, with Dispensing: Mr. Corfe. Fee for six months, £8 8s.; for twelve months, £12 12s.; without dispensing, fee for three months, £6 6s.

Demonstrations in Practical Histology, with the Use of the Microscope: Dr. Van der Byl.

#### SUMMER SESSION.

Materia Medica, &c.: Dr. Stewart, daily, (except Saturday,) at three. One session, £3 3s.; perpetual, £5 5s.

Midwifery: Dr. Frere, daily, (except Monday,) at four. One session, £3; perpetual, £5.

Botany: Mr. Bentley, daily, (except Friday,) at eleven. One course, £3; perpetual, £4.

Medical Jurisprudence: Dr. Goodfellow, daily, except Monday, at nine. One session, £3 3s.; perpetual, £5 5s.

Comparative Anatomy: Mr. G. R. Waterhouse, Tuesday and Friday, at five. Open to all general pupils of the school. Fee from occasional students, £2 2s.

Practical Chemistry: Mr. T. Taylor and Mr. C. Heisch, Monday, Wednesday, and Friday, at eleven. Fee for the course, for general pupils, £2 2s.; non-general pupils, £3 3s.

Clinical Lectures on Monday, Wednesday, Thursday, and Friday, at one.

Practical Histology and the Use of the Microscope: Dr. Van der Byl, two hours, twice a week. Fee, £2 2s.

Attendance on all the hospital practice and lectures required by the College and Hall, exclusive of practical chemistry, £75; which may be paid by instalments of £30 at the beginning of the first session; £30 at the beginning of the second session; and £15 at the beginning of the third session. For every additional session, £5.

## ROYAL FREE HOSPITAL,

*Gray's Inn-road.*

*Physicians*—Dr. Brinton, Dr. Arthur Hassall.

*Physician-Accoucheur*—Dr. Henry Bennet.

*Surgeons*—Mr. W. Marsden, Mr. T. Wakley, and Mr. Weedon Cooke.

*Assistant-Surgeon, (pro tem.)*—Mr. F. J. Gant.

*Medical Officer for Diseases of Children*—Mr. T. Carr Jackson.

*Dentist*—Mr. Robinson.

*House-Surgeons*—Mr. J. B. Curgenven, and Mr. J. Pollard.

*Apothecary*—Mr. Morgan.

*Secretary*—Mr. W. H. Penn.

The Royal Free Hospital contains 160 beds, classed in equal proportions for medical and surgical cases.

A Maternity Department is attached to the hospital.

One of the physicians and one of the surgeons attend daily at the hospital at half-past one. Out-patients seen daily at two.

Surgical operations on Mondays at one. In cases of emergency at all times.

## ST. THOMAS'S HOSPITAL.

MEDICAL AND SURGICAL COLLEGE.

*Consulting Physician*—Dr. Roots.

*Consulting Surgeon*—Mr. Green.

*Physicians*—Dr. Barker, Dr. J. Risdon Bennett, and Dr. Goolden.

*Assistant-Physicians*—Dr. Peacock, and Dr. Bristowe.

*Surgeons*—Mr. South, Mr. Mackmurdo, Mr. Solly, Mr. Le Gros Clark, and Mr. Simon.

*Obstetric Physicians*—Dr. Waller and Dr. Griffith.

The out-patients are seen at half-past eight A.M.

The wards are visited daily from twelve to four.

Operations on Saturdays, at half-past one.

Post-mortem examinations; Dr. Bristowe, and Mr. S. Jones, at half-past twelve.

Admission fee to hospital practice and all the lectures, £40 for the first year, £40 for the second, and £10 for each succeeding year, or £90 at one payment for an unlimited attendance.

Gentlemen proposing to become students of St. Thomas's Hospital are expected to produce satisfactory testimonials of moral character and general education.

### WINTER SESSION.

Introductory Address by Mr. Solly, in the Hall of the Hospital, on Monday, October 2nd, at eight P.M.

*Physiology and General Anatomy*: Mr. Grainger and Dr. Brinton, Tuesday, Thursday, and Saturday, at ten.

*Chemistry*: Dr. R. Dundas Thomson, Monday, Wednesday, and Friday, at ten.

*Surgery*: Mr. South, Monday, Wednesday, and Friday, at four.

*Descriptive and Surgical Anatomy*: Mr. Le Gros Clark and Mr. Rainey, daily, at nine.

*Anatomical Demonstrations*: Mr. Rainey, Mr. Barwell, and Mr. S. Jones, daily, from nine to three.

*Clinical Medicine*: Dr. Barker, Tuesday and Thursday, at four.

*Theory and Practice of Medicine*: Dr. Bennett, Monday, Wednesday, and Friday, at five.

*General Pathology*: Mr. Simon, Saturday, at four.

Clinical lectures are given at stated times by the medical and surgical officers; and Dr. Barker will deliver two clinical lectures, in addition to the above, every week throughout the winter and summer sessions, and give instruction in the clinical wards at least three days in each week, at a fixed hour.

There is a special Ophthalmic ward, under Mr. Mackmurdo; and a special department for the Diseases of Women and Children, under Dr. Waller and Dr. Griffith; in both of which departments clinical lectures are given.

There are also lectures on the Structure and Diseases of the Teeth, by Mr. Saunders, during the course of Physiology.

### SUMMER SESSION.

*Materia Medica*: Dr. Peacock, Monday, Tuesday, Wednesday, and Friday, at eight A.M.

*Forensic Medicine*: Dr. Brinton, Tuesday, Thursday, and Saturday, at eight A.M.

*Midwifery, &c.*, Dr. Waller, Monday, Wednesday, Thursday, and Friday, at nine A.M.

*Comparative Anatomy and Natural History*: Mr. Huxley, Tuesday and Saturday, at nine A.M.

*Botany*: Dr. Bristowe, Tuesday, Thursday, and Saturday, at ten.

*Practical Chemistry*: Dr. R. Dundas Thomson, Monday, Wednesday, and Friday, at ten.

*Clinical Medicine*: Dr. Barker, Monday and Thursday, at four.

### SCHOLARSHIPS AND APPOINTMENTS.

**SCHOLARSHIPS.**—One of £20 to the student who shall be first in a voluntary classical and mathematical examination at the commencement of his studies at the hospital. Two medical scholarships, for first year's men, each of the value of £20 a year, and other scholarships for second and third year's men.

Two house-surgeons, and a resident accoucheur are provided with rooms and commons free of expense. The house-surgeons are selected from gentlemen who have obtained their diplomas to practise, and the resident accoucheurs from the students, on examination.

Fifteen dressers selected every six months, are provided with rooms and commons in the hospital, free of expense during their weeks of attendance.

A general introductory address, by Dr. J. Risdon Bennett, in the hall of the Hospital, on Saturday, the 1st of October, at eight o'clock in the evening.

## UNIVERSITY COLLEGE HOSPITAL,

*Upper Gower-street.*

*Physicians*—Dr. Walshe, Dr. Parkes, and Dr. Garrod.

*Obstetric Physician*—Dr. Murphy.

*Assistant-Physicians*—Dr. Jenner and Dr. Hare.

*Surgeons*—Mr. Quain and Mr. Erichsen.

*Consulting Surgeon to Eye Infirmary*—Mr. Quain.

*Ophthalmic Surgeon*—Mr. Wharton Jones.

*Assistant-Surgeons*—Mr. Marshall and Mr. Statham.

*Dental Surgeon*—Mr. Shelley.

Fees from students who have already entered in the medical faculty of the College to three classes, of which the courses are of six months' duration; also to pupils who produce certificates of having attended a course of lectures of a recognised school of medicine, and during one year the practice of a recognised hospital:—

For perpetual admission to the medical and surgical practice	£26 5
One year to the physicians' and surgeons' practice	21 0
Physicians' or surgeons' practice, separately	15 15
Six months to the physicians' and surgeons' practice	15 15
Physicians' or surgeons' practice, separately	10 10

To pupils other than as above specified:—

For perpetual admission to the medical and surgical practice	£36 15
One year to the physicians' and surgeons' practice	30 0
Physicians' or surgeons' practice, separately	22 0
Six months to the physicians' and surgeons' practice	22 0
Physicians' or surgeons' practice, separately	15 0

Every pupil pays, in addition to the fees, 10s. apothecary's, and 5s. office fee.

Physicians' assistants, house-surgeons, midwifery assistants, physicians' clerks, surgeons' dressers, and ophthalmic surgeons' assistants, are selected from pupils, being students of the College, and of unexceptionable moral character, without additional payments. The physicians' assistants and house-surgeons reside in the hospital, paying for their board.

The physicians' and surgeons' visits are made daily, at one and two o'clock. Each of the physicians visits his patients three times a week.

Out-patients are seen four times weekly by the assistant-physicians and assistant-surgeons.

Lectures on clinical medicine fortnightly, by Dr. Walshe and Dr. Garrod, and twice a week by Dr. Parkes.

Clinical Surgery: Lectures, twice a week, by Mr. Quain, and once a fortnight by Mr. Erichsen.

**Bandaging:** A course of practical instruction in the application of bandages and other surgical apparatus is given by Mr. Marshall.

## UNIVERSITY COLLEGE—FACULTY OF MEDICINE.

## WINTER SESSION.

**Medicine:** Dr. Walshe, daily, at five; on Saturdays, earlier. Entire term, £5; first half-term, £3; second half-term, £3; perpetual, £8.

**Surgery:** Mr. Eriksen, Monday, Tuesday, Thursday, and Friday, at four. For the term, £4 10s.; perpetual, £6.

**Anatomy and Physiology:** Dr. Sharpey, daily, at ten. Entire term, £6; first half term, £3; second half term, £3; perpetual, £9.

**Chemistry:** Mr. Graham, daily, (except Saturday,) at eleven. Entire term, £6; first half term, £3; second half term, £3; perpetual, £9.

The first fifty lectures will form an elementary course to prepare students for the matriculation examination at the University of London. Fee, £3.

**Anatomy, Descriptive and Surgical:** Mr. Ellis, daily, at nine. Entire term, £6; first half-term, £3; second half-term, £3; perpetual, with dissections, £9.

In the dissecting-room, the pupils will be directed in their studies during several hours daily, by Mr. Ellis and by Dr. Boon Hayes, demonstrator.

**Analytical Chemistry:** Dr. Williamson. The laboratory is open daily, from nine A.M. to four, from the 2nd of October until the end of July, with a short recess at Christmas and Easter. Fee, £26 5s., exclusive of the expense of materials, &c., for three months, £10 10s.; for a single month, £4 4s.

**Comparative Anatomy and Zoology:** Dr. Grant, daily, (except Saturday,) at three. Comparative anatomy from the beginning of October to the end of January; zoology from the 1st of February to the 1st of May. For comparative anatomy, £4; for zoology, £3; perpetual, £8.

**Natural Philosophy:** Professor Potter, at a quarter-past four, on Monday, Wednesday, and Friday, from the 17th of October to the 17th of April. Fee, £4.

## SUMMER SESSION.

**Botany:** Dr. Lindley. Junior class till the end of April, at eight A.M. Fee, £2. An elementary course of about forty lectures in March. Senior class daily, (except Monday,) at eight A.M. Fee, £3; perpetual, £6.

**Pathological Anatomy:** Dr. Jenner, Tuesday, Wednesday, and Friday, at nine. Fee, £3; perpetual, £4.

**Paleo-Zoology:** Dr. Grant, daily, (except Saturday,) at three, commencing in April. Fee, £1.

**Practical Chemistry:** Dr. Williamson, Monday, Tuesday, Wednesday, and Thursday, at eleven. Fee, £4, including cost of materials, &c.

**Medical Jurisprudence:** Dr. Carpenter, Monday, Tuesday, Thursday, and Friday, at ten. Fee, £3.

**Midwifery, &c.:** Dr. Murphy, daily, (except Saturday,) at twelve. Fee, £3; perpetual, £6.

**Ophthalmic Medicine and Surgery:** Mr. Wharton Jones. Fee, £3.

**Materia Medica and Therapeutics:** Dr. Garrod, daily, (except Saturday,) at four. Fee, £4; perpetual, £6.

The payments stated above for each class are made by students nominated by proprietors: 5s. additional for every pound, until this extra payment amounts to £4 10s., are paid by those not nominated.

A college fee of 10s. for one class, and £1 for two or more classes, is paid by each student every session: where, however, the course is of short duration, this fee is diminished. The matriculation fee of £2 relieves the student, during the whole course of his study, from the college fee.

At the end of every session, the "Longridge" Exhibition of £40 is awarded as a prize for general proficiency.

## WESTMINSTER HOSPITAL,

Westminster Abbey.

**Physicians**—Dr. Hamilton Roe, Dr. Kingston, and Dr. Basham.  
**Assistant-Physicians**—Dr. Fincham and Dr. Radcliffe.

**Consulting Surgeons**—Mr. Guthrie, Mr. Hale Thomson, Mr. Phillips, and Mr. Lynn.

**Surgeons**—Mr. Barnard Holt, Mr. Chas. G. Guthrie, and Mr. Brooke.

**Assistant-Surgeons**—Mr. Holthouse and Mr. Hillman.

**Surgeon-Dentist**—Mr. Clendon.

**Apothecary**—Mr. Newcomb.

## MEDICAL PRACTICE.

Six months ... ..	£10 10
Twelve months ... ..	12 12
Eighteen months ... ..	15 15
Perpetual ... ..	21 0

## SURGICAL PRACTICE.

Three months ... ..	£8 8
Six months ... ..	12 12
Twelve months ... ..	21 0
Perpetual ... ..	31 10

Conjoint fee for the medical and surgical practice, for the period of hospital attendance required by the Royal College of Surgeons and Apothecaries' Hall, £27 6s.

The hospital affords relief to about 2000 in-patients and 16,000 out-patients annually.

Medical and surgical practice daily, from half-past twelve to two o'clock. Operations on Saturdays at one o'clock.

Post-mortem examinations and demonstrations of morbid anatomy are conducted by Mr. Power, under the superintendence of the physicians and surgeons.

In addition to the clinical instruction given by all the medical officers, special courses of lectures on Clinical Medicine and Surgery will be given by Dr. Hamilton Roe and by Mr. Barnard Holt.

Mr. Guthrie, F.R.S., will also give occasional lectures on some important points of surgery.

Pupils of this school to attend the practice of the Royal Westminster Ophthalmic Hospital, Charing-cross, without additional fee.

A special course of lectures on Dental Surgery is delivered by Mr. Clendon to the pupils, without fee, while instruction in dental operations is given three times a week.

Pupils, when properly qualified to attend lying-in patients, are supplied with cases from the Maternity Charity: Physician, Dr. Frederic Bird; Assistant-Physician, Dr. William Ogle.

Practical Instructions on Pharmacy, with opportunities of dispensing, are given by the apothecary, Mr. Newcomb.

## WESTMINSTER HOSPITAL MEDICAL AND SURGICAL SCHOOL.

## WINTER SESSION.

Introductory Address, by Mr. Barnard Holt, on Monday, October 2nd, 1854, at seven o'clock P.M., after which a Conversation will be held in the Board-room of the Hospital.

**Anatomy and Physiology:** Mr. Hillman, Monday, Wednesday, and Friday, at two. One course, £5 5s.; perpetual, £7 7s.

**Anatomy, Descriptive and Practical:** Mr. Holthouse and Mr. Power, daily, (except Saturdays,) at three. One course, £5 5s.; perpetual, £7 7s.

**Anatomy, Physiology, and Surgery:** Mr. Holthouse and Mr. Power. Dissections superintended by Mr. Power.

**Physiology and General Anatomy:** Mr. Hillman, Monday, Wednesday, and Friday, at two. One course, £5 5s.; perpetual, £7 7s.

**Surgery:** Mr. C. G. Guthrie and Mr. Brooke, Tuesday, Thursday, and Saturday, at half-past nine. One course, £4 4s.; perpetual, £5 5s.

**Medicine:** Dr. Basham, Monday, Tuesday, Thursday, and Friday, at four. One course, £4 4s.; perpetual, £5 5s.

**Chemistry:** Mr. Lewis, Monday, Wednesday, and Friday, at nine. One course, £5 5s.; perpetual, £7 7s.

**Dental Surgery:** Mr. Clendon, Wednesday, at ten. One course, £2 2s. Free to the hospital pupils.

## SUMMER SESSION.

**Materia Medica:** Dr. Basham, Tuesday, Wednesday, and Friday, at two. One course, £3 3s.; perpetual, £4 4s.

**Midwifery, &c.:** Dr. F. Bird, Tuesday, Thursday, and Friday, at four. One course, £3 3s.; perpetual, £4 4s.

**Forensic Medicine:** Dr. Fincham, Monday, Tuesday, Thursday, and Friday, at three. One course, £2 2s.; perpetual, £3 3s.

**Botany:** Dr. Radcliffe, Tuesday, Friday, and Saturday, at two. One course, £2 2s.; perpetual, £3 3s.

**Practical Chemistry:** Mr. H. Lewis. Fee for course, £2 2s.

**Natural Philosophy:** Mr. Brooke, Wednesday, at three. One course, £1 1s.

General fee to all the lectures required by the Royal College of Surgeons and Society of Apothecaries, £44 2s., exclusive of Practical Chemistry.

Fee to all the lectures and hospital practice required, £71 8s., which may be paid at once, or by instalments of £30 at the commencement of the first session, £30 at the commencement of the second session, and the remainder at the commencement of the third session.

The office of honorary demonstrator will be conferred on the second-year's student who shall obtain the prize in practical anatomy, and who will act as assistant demonstrator of anatomy for the year ensuing.

The office of anatomical prosector will be given to the student who, at the termination of the first session, shall have attained the greatest proficiency. He will have to dissect the parts required for the Anatomical course, and will thus obtain the privilege of dissecting for an entire session free of expense.

Clinical assistants, clinical clerks, and dressers, are selected from the best qualified students without extra fee.

### SCHOOL OF ANATOMY AND MEDICINE,

ADJOINING ST. GEORGE'S HOSPITAL,

1, Grosvenor-place.

#### WINTER SESSION.

**Anatomy and Physiology:** Dr. Lankester, Mr. G. E. Blenkins, and Mr. Lane, daily, (except Saturday,) at ten. Course, £6 6s.; unlimited, £8 8s.

**Descriptive and Surgical Anatomy:** Mr. G. E. Blenkins and Dr. A. Deville, daily, at a quarter-past eleven. Course, £6 6s.; unlimited, £8 8s. Dissections under the superintendence of Dr. Deville and Mr. A. Brown.

**Chemistry:** Mr. Rodgers, Monday, Wednesday, and Friday, at nine. Course, £5 5s.; unlimited, £6 6s.

**Medicine:** Dr. Cormack and Dr. Ballard, daily, (except Saturday,) at a quarter-past four. Course, £5 5s.; unlimited, £6 6s.

**Surgery:** Mr. Pilcher and Mr. T. Spencer Wells, Tuesday, Thursday, and Saturday, at nine. Course, £3 3s.; unlimited, £5 5s.

#### SUMMER SESSION.

**Materia Medica and Therapeutics:** Dr. Ballard, daily, (except Saturday,) at four. Course, £5 5s.; unlimited, £6 6s.

**Midwifery:** Mr. Bloxam, daily, (except Saturday,) at a quarter to three. Course, £3 3s.; unlimited, £5 5s.

**Medical Jurisprudence:** Dr. Benjamin J. W. Richardson, Monday, Wednesday, and Friday, at nine. Course, £3 3s.; unlimited, £4 4s.

**Botany:** Dr. Lankester, Monday, Wednesday, and Friday, at half-past eleven. Course, £3 3s.; unlimited, £4 4s.

**Practical Chemistry:** Mr. Rodgers, Tuesday, Thursday, and Saturday, at half-past nine. Fee for course, £3 3s.

**Comparative Anatomy:** Mr. R. T. Hulme, Tuesday, Thursday, and Saturday, at half-past ten. Course, £2 2s.; unlimited, £3 3s.

**Organic and Physiological Chemistry:** Dr. Marcet.

General fee to the whole of the courses required by the College of Surgeons and the Apothecaries' Company, including one course of Practical Chemistry, forty-two guineas, half of which may be paid on the entrance of pupils, and the remaining half in January.

Demonstrations with the Microscope will be regularly given in the courses of lectures on Anatomy, Physiology, Pathology, and Botany.

Pupils desirous of cultivating the important art of Organic Analysis will have an opportunity of doing so, under the direction of the lecturers on Chemistry, in their private laboratories.

Arrangements will be made for the delivery of courses during the summer session, on the following subjects:—Pathology and Morbid Anatomy; Aural Surgery; Ophthalmic Surgery; Dental Surgery; Natural Philosophy.

A classical and mathematical tutor will prepare gentlemen for their preliminary examination at the Hall, Colleges, and Universities.

### ST. LUKE'S HOSPITAL FOR LUNATICS,

Old-street.

**Physicians**—Dr. Alex. J. Sutherland, F.R.S., Dr. Henry Monro. **Surgeon**—Mr. James Luke.

**Resident Medical Superintendent**—Mr. Henry Stevens.

The practice of this hospital is open to a limited number of pupils.

Lectures on the Nature and Treatment of Insanity are delivered annually, by Dr. Sutherland, and clinical lectures are given from time to time.

Clinical clerks are also selected from such pupils as have completed three months' attendance on the hospital practice.

Sessions of three months each commence on October 1st, January 1st, and May 1st, in every year. Fee for each session, £3 3s.

### SCHOOL OF MIDWIFERY,

Russell-place, Fitzroy-square.

#### SUMMER SESSION.

DR. J. HALL DAVIS delivers his annual course of lectures on Obstetric Medicine, with Clinical Midwifery, at 17, Russell-place, Fitzroy-square. These lectures, instituted in 1843, and duly recognised by the examining boards, are illustrated by an obstetric museum, as also by complete apparatus adapted for teaching the student the different operations of midwifery. Further particulars relating to this course, which will commence with the summer term, will be announced in April.

### HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST,

Brompton.

**Consulting Physicians**—Sir J. Forbes, Dr. C. J. B. Williams, and Dr. Walshe.

**Physicians**—Dr. Hamilton Roe, Dr. Theophilus Thompson, and Dr. Cursham.

**Assistant-Physicians**—Dr. Cotton, Dr. Quain, and Dr. Wadham.

Pupils are admitted to the hospital practice.

Fees for six months, £5 5s.; perpetual, £10 10s.

Two clinical assistants reside in the hospital. Pupils are eligible to these appointments, which are held for six months. The resident medical officer, Mr. Edwards, receives two dispensary pupils; and further particulars may be learned from him at the hospital.

### PHARMACEUTICAL SOCIETY,

17, Bloomsbury-square.

**Chemistry and Pharmacy:** Mr. Redwood, Tuesday, Wednesday, and Friday, at half-past eight o'clock A.M.

**Botany and the Natural History of Drugs:** Mr. Bentley, Saturday and Monday, at half-past eight A.M.

The Laboratory for Practical Instruction in Pharmaceutical Chemistry, under Professor Redwood, will be opened on Monday, the 2nd of October. The season extends from the 1st of October to the end of July, and pupils may enter at any period during the season.

**FEES.**—Five months, £15 15s.; four months, £13 13s.; three months, £11 11s.; two months, £9 9s.; one month, £6 6s. Students not registered in connexion with the Society pay a fee of one guinea for attendance at each of the courses of lectures.

**THE BOARD OF EXAMINERS.**—The Board of Examiners meet on the third Tuesday in every month, excepting May and September, for examinations and granting certificates of qualification to practise pharmacy. Candidates are required to give notice to the Secretary, before the first day of the month, of their intention to present themselves for examination.

Fee for minor examination and registration as an assistant, £5 5s.; or, if previously registered as an apprentice or student, £3 3s. For major examination and registration as a pharmaceutical chemist, £10 10s.; or, if previously registered as an assistant, £5 5s.

#### PRIVATE TEACHERS.

MR. POWER and Dr. POWER continue, daily, their Lectures and Examinations in the Lecture-room, Exeter-hall, Strand, preparatory for the various examining boards. Mr. Power receives privately, at his own residence, practitioners preparing for the degree of M.D., or College of Physicians; he also prepares by correspondence.

Dr. STEGGALL gives instruction to medical students in all the branches of their studies, including the classics, at his residence, 2, Southampton-street, Bloomsbury-square.

Mr. GEORGE HIND, F.R.C.S., resumed his private course of demonstrations and examinations, on the morning of the 15th instant, at ten o'clock, A.M. Class-room, 29, Newman-street, Oxford-street; private residence, 9, South-crescent, Bedford-square.

Mr. W. WISEMAN, M.C.P., of Kelvedon School, Essex, has made arrangements at his establishment to fully qualify young gentlemen for passing the preliminary examinations at the University of London and Apothecaries' Hall.

# THE LANCET.

LONDON: SATURDAY, SEPTEMBER 16, 1854.

FOR more than thirty successive years it has been our annual custom to address, to those who are about to embark in the profession of Medicine, such advice as may serve to guide them in their first and most important steps. A false step at the outset is not easily retrieved. It may exert a lasting and injurious influence upon the whole future career of the student. He who deliberates well and determines wisely before commencing his journey, will travel pleasantly along the road, and may reasonably expect to attain the goal with safety and success. The necessity of serious deliberation before entering upon any career is a general and obvious truth; but it is pre-eminently necessary before adopting the profession of Medicine. Whosoever shall survey the requirements demanded of aspirants to the honours and emoluments that belong to the various professions, whether of Theology, of Law, of Medicine, of Commerce, or of Arms, will not fail to observe that, whilst the education and mental accomplishments demanded of the medical practitioner are of the highest order, and tested most rigorously, the honours and emoluments to which he can look forward are infinitely below those to which the priest, the lawyer, the merchant, or the soldier may attain. He therefore who in after-life would escape the bitter but unavailing regret that he had chosen a profession in which the toil is great and the worldly reward is small, should ponder well before embracing the profession of Medicine. He whose ambition leads him to aspire to great wealth, social distinction, high place, and an honourable and peaceful retirement, must seek some other career. The physician lives and dies in harness. A large and an oppressive share of his time and skill is a free offering to charity—a voluntary and unrequited contribution to the public service. But for the man who can enter upon it in a spirit of humility,—who regards that as the noblest ambition which aspires to benefit mankind,—whose faith is expressed in the maxim of BACON, “*Efficaciter operari ad sublevanda vitæ humanæ incommoda*,”—such a man may fearlessly and trustfully consecrate his life and his energies to the practice of Medicine.

The science of Medicine, as we have always contended, and as it is now beginning to be understood, is a science that has a far wider application and a far nobler mission than the limited duty of leading the sick back to health. In the present age, more than at any previous epoch of the history of the world, men are brought together into immense masses, under a variety of conditions powerfully and variously affecting the health of individuals and of communities. Thousands of human beings are closely congregated in factories; emigrants and sailors now crowd our transports and men-of-war in numbers unheard of in former times; armies encamp or move about in gigantic masses. The great problem of Medicine now is, not so much how to cure a particular case of pneumonia or of fever, but how to *prevent* the outbreak of pestilence; to discover and to avert all the causes of epidemic and endemic disease; in one word, how to increase the sum of human happiness, to remove the most terrible and the most oppressive incubus upon phy-

sical and intellectual activity, by *preserving* the health of communities. Regarded in this light, the profession of Medicine acquires an importance which it has never yet challenged. When it is considered how many great enterprises by sea and land, of peace and war, may terminate disastrously, if the health of those who are charged with their execution fail, surely the physician, thus necessarily brought into intimate relation with the planners and administrative chiefs, must rise to a conspicuous place in the public esteem. Thus, not only is the mission of the medical practitioner enlarged, but in proportion as he is found more and more essential to the success of enterprises of moment, it may be hoped that a larger measure of public honours and rewards will accrue to the profession of Medicine.

We have thought it not unsuitable, as an introduction to the immediate purpose of this Address, to lay before our young readers this comprehensive view of the duties and scope of the profession we will now suppose them to have selected. To be qualified for success in a calling having such vast and difficult duties to discharge, demands, we need scarcely say, in the first place, a sound and liberal general education. The example set by the University of London, of demanding ample proof of general knowledge as the condition of initiation into the special study of Medicine, is now generally followed. The matriculation examination of the Metropolitan University requires of the candidate a competent knowledge of Arithmetic, Algebra, Geometry, Natural Philosophy, and Chemistry; of Greek and Latin classics; of the English language; of History and Geography; and of either French or German. The Apothecaries' Society has also instituted a preliminary examination framed upon a similar plan. The College of Surgeons has in like manner caught a partial glimpse of truth. A classical and mathematical examination now precedes the examinations for the Fellowship. This is something. Hereafter, possibly, another beam of light may break through the heavy portal of Lincoln's-inn-fields—or as that has a northern aspect, the light may steal in by the back-way—and the candidate for the Membership, the “ordinary-emergency man,” may also be required to show that he can write his native language correctly, and that he possesses the education of a gentleman. But in any case it behoves the student who aspires to take an honourable position in a “learned” profession, not to frame his estimate of the character of the medical practitioner upon the worn-out standard of slow-moving corporations. We therefore earnestly exhort those who may unhappily have neglected their general education, to make the best speed to repair their neglect. We strongly advise those who may feel themselves equal to the ordeal, to take the classical and mathematical examinations of the University of London, and of the Apothecaries' Society, as *early* as possible. The University examination takes place in July. Since the first examination for the degree of Bachelor of Medicine cannot be passed until two years from the date of the matriculation, it is the more important not to delay. The preliminary examination of the Apothecaries' Society takes place twice in the year.

The preparation and acquirements necessary for passing the examinations of both these institutions, though varying somewhat in extent and degree, are of the same kind. It will be found most convenient to pass both as nearly as possible at the same time.

We will now consider the course the student should adopt

in the pursuit of the special knowledge of Medicine. One of the first questions that will arise, is the choice of a school. It is not our custom to point to any one school in preference to the rest. In this number of our Journal—a number specially devoted to the object of placing before the student every information that can be of use or interest—we have gathered together under one view the educational capabilities and particular advantages of all the Schools and Hospitals in the Metropolis.

In all of them we believe the student will find adequate schemes of instruction and competent teachers; and, what is of greater value, fertile fields for observation, in which he may cultivate his mental faculties, and reap the full harvest of knowledge. In stating this opinion, however, we cannot miss the opportunity of adding a remark upon what we have long felt to be a serious defect in the system of medical education in this country. It is a defect which it is very much in the power of the student to remedy. It is for that reason that we are the more desirous to refer to it in this place. There is a vulgar phrase which describes the medical student in London as “walking the hospitals.” The phrase conveys a very false notion of the reality. The student does not “walk the hospitals.” His studies are for the most part limited to one hospital—the particular institution to which he enters—and to which he pays his fees. All the rest are practically closed to him. The boundless materials for medical instruction congregated in this vast metropolis are subdivided into small sections, each offering, to a very limited extent, the advantages which free access to the whole might afford. Should the hospital assigned to him by choice or accident prove deficient in any branch of Medicine; should it, as is the case in some, exclude certain diseases, the student cannot, without great inconvenience and often considerable expense, supply the deficiency by complementary study in other hospitals.

In addition to this, there is another evil attending the plan of confining one's education to the wards of a single hospital. The student hears the opinions and sees the practice of a small set of men. Opinions and practices so taught and repeated before a limited and unchanging audience are apt to become dogmatic and routine in their character. The reaction upon the school and the teacher is pernicious. The effect upon the student is to narrow his mind, to check the spirit of free inquiry, to foster the slavish and dangerous tendency, “*jurare in verba magistri*.” To counteract this tendency, we counsel the student to seize every fair opportunity of extending the sphere of his observation beyond the hospital to which he is especially attached. Let him pay an occasional visit to the wards of other hospitals. Let him compare the views and the practice of the physicians and surgeons of different hospitals. He will find in this pursuit a most valuable guide in THE LANCET “Mirror of the London Practice of Medicine and Surgery.” By this course he will shake off many prejudices; acquire a more extensive and accurate appreciation of the various modes of treating disease; he will learn many truths in pathology that would otherwise escape him; the different and often seemingly opposite modes of treating the same disease, ending perhaps in the same result, which he will witness, cannot fail to give him a more correct insight into the processes of nature, and to enlarge his knowledge of his art. We will go a step further. We would suggest that some liberal and systematic arrangement may be adopted to facilitate the visits

of students to all the hospitals in London. This facility should be afforded to third and fourth year's men, who, having previously acquired the necessary information to enable them to observe profitably, would derive the highest benefit from that mental correction which more enlarged experience never fails to bring. By the course we suggest, the inconvenience and disappointment that now not unfrequently result from being tied down within a narrow circle of observation, would be avoided. The individual student would gain much. Science in the aggregate would gain no less. In Paris, where the hospitals are all under one general management, where no pecuniary impediments obstruct the freest interchange of scientific knowledge, the student enjoys the advantages we have pointed out to the fullest extent. We strongly advise those who are able to do so, to carry the principle yet further, and, before they settle down in practice, to enlarge their knowledge of disease, and to extend their mastery over the ills that flesh is heir to, by comparing the practice of our Continental brethren with our own.

But even with or without this opportunity of enlarged observation, we still do not think the choice of an hospital a matter of the first importance. He who brings to the study of his profession the spirit of independent inquiry; of industry that will not be daunted; and the inestimable quality of self-reliance, will not fail to discover in any hospital ample means of instruction. He who does not feel within him the impulse to learn, the necessity to work,—who waits to be taught, to have a contracted-for amount of Anatomy, Physiology, Materia Medica, Medicine, and Surgery served out to him and packed up for him, as a patient mule waits for the load to be laid upon his back,—will find one hospital as good as another, and all equally useless. Knowledge is for him that seeks it.

The student, then, has made his choice of an hospital. How or in what order shall he prosecute his studies? Upon this point we have little to offer. The curricula prescribed by the College of Surgeons and the Apothecaries' Society, define the order in which the several departments of professional education shall be studied with so much minuteness, that the student has no alternative but to follow that order. Upon the whole, we will admit that the order laid down is a natural and reasonable one. But we are inclined to question the general utility of prescribing an uniform course of study that shall in all cases be rigorously and undeviatingly pursued. It may be doubted whether the adoption of the stringent curricula referred to was not dictated, in a great measure, by a false and unhealthy principle of accepting a conventional *proof of study*, in substitution of *proof of knowledge*. In our system, certificates of attendance upon lectures are largely received as equivalents for examinations. We could wish that our Colleges and Halls would rely a little more upon examination, and be less punctilious about certificates. The University of London, which exhibits the greatest liberality in the matter of certificates, and leaves the student the utmost freedom in his course of study, institutes the most rigid of examinations. We think it will not be disputed that by this policy the University takes the best security for the knowledge of their candidates. Attendance upon lectures and hospitals are amongst the means of obtaining knowledge and skill. But knowledge and skill is the end and aim of study. Our Colleges adopt, very rigorously and very absurdly, a sort of police-spying to ascertain that the student avails himself of the means. By a

curious kind of logic they conclude that he has acquired the end because he possessed the means !

While, however, we counsel a general adherence to the course of study prescribed by the Examining and Certificate-receiving Boards, we would caution our young friends against following it in too literal and servile a spirit. The young student should undoubtedly dissect diligently; he should attend regularly the lectures on Anatomy and Physiology; but he should not defer his visits to the bedside to a late period of study. The observation of disease—of the manifold appliances of modern surgery and medicine—he should commence as early as possible. We will not assent unreservedly to the maxim of BAGLIVI, that, “*Ars medicæ est tota in observationibus;*” but to a great extent it is undoubtedly true. Books should be used, we will not say sparingly, but discreetly; as guides to clinical observation and original research, not as authorities to satisfy the mind with the false notion that they can impart true knowledge, or enable the student to dispense with personal labour. The reader is not necessarily a worker.

For the same reason we would warn the student against voluminous note-taking. Let him beware of heaping up undigested masses of extracts or lectures. The man who does not study out for himself the relations of things, who does not assimilate them, as it were, with his own mental organization by reflection, profits little by accumulating detached scraps of wisdom and alien experience in note-books, or even in his memory. “Memory is not wisdom; idiots can rote volumes. The grafted stock—should that be proud of apples not its own?” It is by meditation, corrected by experiment, putting to the test of reason and practice, that we learn to estimate the truth and value of the writings or dicta of others. When we shall have subjected them to this process, we shall have acquired knowledge that will never desert us, that will be part of ourselves. The best qualities of the mind, the faculties of comparing, of judging, and of prompt and accurate decision, will be thus trained and improved. Intellectual power, often more valuable than mere knowledge, will be possessed. It has been well observed by that acute thinker, SYDNEY SMITH, that “The desirable and useful thing is, that we should carry our knowledge about with us as we carry our health about with us; that the one should be exhibited in the alacrity of our actions, and the other proved by the vigor of our thoughts. I would as soon call a man healthy who had a physician’s prescription in his pocket, which he could take and recover from, as I would say that a man had knowledge who had no other proof of it to afford than a pile of closely-written common-place books.”

In what we have said we have been less solicitous to point out a precise and definite track to be servilely followed, than to impress upon our young friends the importance of cultivating a habit of diligent practical research, of self-reliance, and of independent inquiry. Promptitude of decision, vigor in action, are the great and indispensable qualities of the practitioner. To acquire these inestimable qualities, study, long and patient observation, and experience are necessary.

If labour be now more essential than ever before to master the actual forces of Medicine, there are not wanting other incentives of a more obvious and immediate kind. The principle of competition is now largely recognised. Superior merit is every day becoming more and more the acknowledged title to preferment and confidence. The valuable appointments of the

East India Company are now held out as prizes for the most able. The system will certainly be extended. We are not without hope that something like the *concours* will be adopted as the test of qualification for hospital appointments. The day may yet arrive when men of science and worth will not be compelled to sue for the most sweet voices of brewers, bakers, and grocers. The advent of this much-to-be-desired epoch, the emancipation of an honourable profession from this degrading servitude, will be hastened, if each one of those whom we are now addressing—the rising generation of students—will zealously and honestly strive, not only to make himself an able practitioner, but to make himself worthy of the profession he has chosen. Let him remember that he has a duty to perform, not to himself alone, but to the body to which he belongs. Let him earnestly strive to maintain and to elevate the social and political position of his profession: If he do this in a right and manly spirit, he will not only obtain honour for himself, but take the surest course to promote the great end of the noble science of Medicine—the alleviation of human suffering—the welfare of his fellow-men.

IN reply to a vast number of questions which have been addressed to us on the subject, and in consequence of communications we have received from numerous practitioners, we do not hesitate to express the opinion, that hundreds of lives have fallen sacrifices, within the last few days, to the treatment of Cholera by *castor oil*. All experience has hitherto shown that in nearly every instance, if the diarrhoea and vomiting be stopped at the commencement, a cure is effected. The result of the mass of facts which have reached us, enables us to say emphatically, that we consider the treatment of choleraic diarrhoea by castor oil, and a reliance upon that purgative as the chief anti-choleraic medicine, to be prolific sources of danger and death. It would probably not be erroneous to allege that the whole of the 2,362,236 persons, which are mentioned as constituting the population of London in the last week’s Report of the Registrar-General, are every one—man, woman, and child—affected at the present moment by the agencies which produce Cholera; and that in many thousands of them a few doses of castor oil, or of any other active purgative, would be sufficient to excite the disease in its most virulent form. In our next we shall refer to this subject at greater length.

IN the crowded state of our columns this week, we have only space to briefly, but emphatically, urge upon our brethren the value and importance of filling up the “Returns of Choleraic Disease” just issued by the General Board of Health. It is only by the cordial co-operation of medical practitioners in such a praiseworthy work, that anything like accurate data can be arrived at for determining the laws which regulate the fatal disease known as Cholera. We feel confident that the President of the Board of Health will not be disappointed in the assistance which he will receive in this inquiry from the members of the medical profession.

MEDICAL BENEVOLENT COLLEGE.—The first legacy of £100, bequeathed by the late Mrs. Barr, has just been handed to the treasurer, by the executor, J. R. Unwin, Esq., surgeon, of Brixton, at whose suggestion it was bequeathed. As it is, doubtless in the power of many members of the profession to benefit the College in like manner, we trust that this is only the precursor of many such benefactions.

## THE PROGRESS OF CHOLERA IN THE HOSPITALS OF LONDON.

THE rapid and fearful spread of the epidemic, in the early part of this month, has been especially felt in those hospitals situated in the vicinity of the principal foci. Guy's and St. Thomas's, on the south side of the Thames, receive a great many cholera patients, owing to the great prevalence of the disease in the south districts; and the Middlesex and University College Hospitals have also had a large influx, in consequence of the sudden and appalling concentration of the choleraic miasm in a certain portion of the western sub-district, called St. James's, Westminster, (Berwick-street, Golden-square, &c. &c.)

When we made inquiries at the Middlesex Hospital, on September 4th, which were kindly and readily answered by Mr. Sibley, the house-physician, we found that on that day there were no less than sixty cholera patients in the house, even the surgical wards having been invaded by them. Mr. Sibley considers that on September 1st, at eight in the morning, (the disease generally appearing, as is well known, a few hours after midnight,) a sudden outburst of cholera took place in the neighbourhood above-mentioned; and in the space of three days no less than 120 patients were brought to the Middlesex Hospital, a great number being, besides, sent to University College Hospital, for want of room. Most of the cases were in the last stage, and it may therefore be easily imagined how great the mortality must have been. It is reckoned that about two-thirds of the patients have sunk. The treatment mostly used at the Middlesex Hospital has been the saline, with the addition of small doses of calomel, and moderate stimulation.

It will be perceived, that owing to the large number of cholera patients admitted into this hospital, no separate accommodation could be thought of; but the wards are kept thoroughly ventilated, and in each of them we remarked large dishes, containing a mixture of manganese, sulphuric acid, and common salt. In fact, so plentifully is chlorine evolved, that the smell of this gas is readily observed on entering the hospital.

At University College there were about eleven cholera patients in the house on September 8th, the number of admissions since September 2nd having been about twenty-five. The proportion of deaths has been nearly one-half, the line of treatment consisting of small doses of calomel, according to Dr. Ayre's plan.

At Guy's the same rapid increase noticed in some of the western districts was observed, and more than twenty-five patients were admitted between the 1st and 4th of September; of these, up to the latter date, about seven had died; and on the day of our visit to the hospital, injections into the veins were being tried, but with no evident success. Several cases, (about five or six,) have occurred in the medical wards amongst patients admitted for other diseases, but no seizures have been observed on the surgical side.

At St. Thomas's, on September 5th, there were twelve cholera patients in the house; and since September 1st no more than about twenty had been admitted. The mortality has been comparatively small, as only one-third have sunk. Of course, all depends on the stage in which patients are admitted; but we may add, that at this hospital care is taken that the means used be extremely few, the over-medicating of patients being sedulously avoided.

At Charing-cross Hospital, up to September 5th, about fourteen cases have been admitted; this being a great increase, as in our last report this hospital was stated to have received but one cholera patient. The treatment adopted is the same as we mentioned in the account above alluded to—viz., dilute sulphuric acid and artificial heat.

The German Hospital, Dalston, had, up to a recent date, been remarkably free from cholera cases, but the renewed outbreak has also been felt here. The sudden influx took place on September 3rd, and hardly had the first patient been admitted, than a man, already an inmate, and under treatment for another disease, was seized with cholera. On September 6th, there were nine cases in the house; the deaths up to that date having been only two. Some of the patients were brought in by the police as accidents, the individuals, amongst whom was an Italian organ boy, having been stricken in the public thoroughfares. The treatment adopted by Drs. Sutro

and Weber, in this hospital, consists of small doses of calomel and opium, with moderate stimulation, in the shape of port-wine, &c.

At St. Mary's Hospital, Paddington, we were informed, by Mr. Ormerod, one of the resident medical officers to the institution, that only one new case was admitted on September 11th, and no cholera patients had been brought in for the previous four or five days. Since the beginning of the epidemic, about twenty-four cases of cholera have been treated; the number of deaths having been a little above half that number. It will be perceived that the disease is in this district rapidly decreasing. Dr. Chambers prescribes calomel when the vomiting is severe and there is but little purging; but when the alvine dejections are very numerous, he gives sulphuric acid. This latter medicine has been found very efficacious; but when the looseness is not controlled by the administration of the acid, injections of a scruple of acetate of lead to six ounces of water have been extremely serviceable. When sickness was present without purging, castor oil has been tried, with no satisfactory results. In the secondary fever, when there was congestion about the head, Dr. Chambers has ordered leeches to the anus.

At the Westminster Hospital eight cases were in the house on September 11th, and it was computed that about eighty cases had been admitted since the outbreak of the epidemic. Of these about half had died; but it should be observed that a great many were brought into the house in a hopeless state of collapse. The treatment is still the same as mentioned in our former report—viz., calomel and opium, stimulants, warm baths, &c. There have been noticed at this hospital several distinct outbursts of the disease, when the influx was very large, and Dr. Fincham, who has the care of many of the cases, suspects, with some reason, that these outbursts are owing to a sudden concentration of the virus upon one locality. The patients seized with the disease seem to have inhaled a large proportion of the miasm, and, indeed, so large, that the organism soon sunk under its effects.

At St. Bartholomew's there were, on September 11th, twelve patients in Bentley ward, (male,) and about the same in Lucas ward (female.) Since the outbreak, seventy-four women and 120 men have been admitted. Mr. Wood, the resident medical officer, who answered our inquiries with great readiness and courtesy, considers that many of these cases presented symptoms which would justify the name of choleraic diarrhoea; these were benefited in a remarkable degree by calomel and opium, (in doses of five grains of the former and one of the latter,) given more or less frequently according to circumstances. The number of deaths has been twenty-three females and twenty-nine males. Dr. Black has given a trial to cold water; and some cases have also been treated with castor oil and capsicum, but the results have not been peculiar. One fact, however, has been clearly elicited—viz., the reviving effect of the injection of a saline solution into the venous system. The proportions have been so regulated as to imitate the saline constituents of the serum of the blood. Mr. Wood has used the following quantities:—Common salt, three ounces; phosphate of soda, one ounce; bicarbonate of soda, one ounce and a half; sulphate of soda, half-a-drachm; water, as much as is sufficient, at 98° Fahr., to get a solution of a specific gravity of 1030. Of this fluid about thirty ounces were injected in two cases. Both patients were remarkably revived by the operation, but died some hours afterwards.

At the Royal Free Hospital the epidemic is on the decrease, as on September 11th there were only twelve cases in the hospital. The deaths have been more than half, and it was stated that some patients had had no premonitory symptoms. The treatment has been the same as described in our former cholera report, (see THE LANCET, vol. ii. 1854, p. 192,) and castor oil has been tried, but with no success.

At King's College Hospital there were seven patients in the house on September 11th. Dr. Johnson is still pursuing the castor oil plan. It is reported that he obtains favourable results, and that a large majority of the patients have recovered.

At St. George's Hospital about twelve patients were under treatment on September 11th, the cases admitted for the last three days being about seven, five, and two. Amongst the inmates of the house, the surgery-man and one nurse have died, the latter having had the care of a ward where numerous cholera patients were placed. These are here distributed through the ordinary medical wards. At the present time large doses of sal volatile are being tried.

At the London Hospital seven cases were under treatment on September 12th, three having been admitted on that

day. The treatment has not varied much from the method followed in former epidemics.

It will be perceived that, excepting the outburst in St. James's, Westminster, the disease is on the decrease in public institutions, and it is to be hoped that, with the active exertions of the Board of Health, the different local authorities, and the medical profession, the amount of danger will gradually diminish.

## THE CHOLERA.

RELATIVE to the progress of the Cholera in the Metropolis, we condense the following from the "Weekly Return" of the Registrar-General, for the week ending September 9th:—

Districts.	Elevation above water mark.	Population (1861).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	208
Central (St. Giles, &c.).....	49 "	393,256	117
Western (Kensington, &c.)	28 "	376,427	545
Eastern (Shoreditch, &c.)...	26 "	485,522	208
Southern (St. Saviour's, } Lambeth, &c.) }	6 "	616,635	972
			2050

Of these 954 were males, 1096 females.

614 " under 15 years of age.

1128 " above 15 and under 60.

287 " above 60 years old.

276 persons are stated to have died from *diarrhœa*.

The deaths from cholera in the last nine weeks have been 5, 26, 133, 399, 644, 729, 847, 1287, 2050, and in the aggregate 6120 persons have lost their lives by the disease.

Much discussion has taken place as to what may have been the chief exciting cause of the particularly severe local outbreaks of the disease which have taken place within the last fortnight in certain parts of London and its suburbs. Much obloquy has been cast upon the Commissioners of Sewers for selecting this particular time for the purpose of opening so many conduits, to the great danger and alarm of the inhabitants of certain districts. Wood-street, Cheapside; and Suffolk-street, Clerkenwell, have been especially referred to, as also the districts of King-street, Cannon-row, &c., near the houses of Parliament. We ourselves can testify to the alarm of the residents, and the disgusting smells, &c., pervading some spots in Westminster, where mounds of black clay and seething mud are piled up almost to the first-floor windows, the whole length of a narrow (now impassable) thoroughfare. The open sewers of St. George's, Camberwell, and certain parts of the great Chelsea sewer, have received, in particular, animadversion.

A correspondent in *The Times* of Tuesday, adverts to the probability of the recent severe outbreaks of cholera in districts east of Regent-street being greatly induced by house-drains communicating with the leading sewers not being "trapped." The mockery of such a system of sewerage or drainage must be obvious to all. As it would be unwise to disturb these sewer openings at the present moment, when the atmosphere seems tainted with the prevailing epidemic, it has been suggested that a tarred sack should in dry weather be laid over each street grating, so as to prevent the escape of effluvia. It would be but a trifling exercise of trouble for the servant of the person whose house might be in front of the grating, or for the police during the night, to fold the piece of tarred sacking back, so as to allow of the escape of water, should a fall of rain occur.

In connexion with the sudden and intense malignancy of the irruption of the cholera on the south side of Oxford-street, and certain portions of Soho, the following amongst other communications to the public papers, has appeared in *The Times*:—"The pit alluded to by Macaulay as having been dug at the east of Regent-street, opposite Conduit-street, when the great plague was raging, and into which the dead-carts had nightly shot corpses by scores, is situated within the area bounded by Argyll-place, King-street, Tyler-street, and Marlborough-street. Little Marlborough-street stands directly over the pit. In excavating for sewers here some time since, the ground disturbed was found to consist chiefly of black decayed animal matter, mixed with bones. On discovering this, precaution was taken not to remove more of it than was possible, what was thrown

out was covered over with quick-lime, and carted away, and the contract hastily completed. The sewers hereabout, to my knowledge, (with the exception of the sewer in Great Marlborough-street,) are as perfect as sewers can be, and free from accumulation. What can have produced the fearful mortality in this neighbourhood I cannot conceive. It is true that the houses generally are closely built together, and are very dilapidated, with little or no open areas or yards back or front. They are, moreover, densely populated by the poor, most of the floors and rooms being let off to separate families and persons."

From the reservoir within the garden enclosure of St. James's-square, the whole of the water has been drawn off, and the open space filled up with earth, a fresh grassplot being laid on the surface, which will doubtless be not less fragrant to the inhabitants than the stagnant pool of water that has for so many years been suffered to exist. The fact that these open pieces of water in the metropolis are most objectionable is satisfactorily proved from the cart-loads of offensive matter which had encrusted the basins of the fountains in Trafalgar-square, and which were not removed until the attention of the authorities about this time last year had been aroused to a conviction, that if suffered to remain in that state, it was calculated to produce malaria and disease in its worst form throughout the neighbourhood. The whole theory, indeed, of forming serpentine, lakes, fountains, and ornamental (?) pools of water within or near to the precincts of large towns in such a damp, foggy, chilly climate as our own, is contrary to the principles both of propriety and æsthetics. The air is here damp or wet enough in all conscience, without attempting to add to it by such artificial media as it is now the fashion to praise.

Mr. Tilley, the surgeon of the Westminster Dispensary, was seized with cholera on Sunday evening, shortly after having attended some cases of the disease, and so violent was the attack, that in a few hours, notwithstanding every effort of medical skill, his case became hopeless. The Rev. Nugent Wade, the rector of the parish, who administered the last rites to the moribund, became himself very ill, as did also Mr. Bowles, a medical gentleman present. The body was buried as quickly as possible.

The foreign obituary for the last week announces the death, near Naples, of the Cavaliere Melloni, the distinguished physician and savant; as also the death, by cholera, of two well-known journalists of Augsburg—viz., Dr. Widemann, the editor of the *Ausland*; and Herr Mebold, one of the directors of the *Augsburg Journal*.

The cholera has been increasing in Scotland. In Edinburgh and Glasgow the disease is said to give way according as sanitary measures are carried out with effect; but in some of the more densely-peopled localities it seems to have got a very firm footing. In most other towns isolated cases have appeared. In the city of Aberdeen there have been several cases, and on Sunday an Irish family, in one of the lowest localities, had four deaths—a mother and three children—out of five persons attacked. The local authorities were indefatigable in their sanitary efforts, and the general health of the city is good.

The great demand made upon our space this week will only permit us further to remark, that we have received a communication (illustrated with cases) upon an asserted highly satisfactory mode of treatment put in force in the Mauritius (on the Wolmar estate) during the present epidemic. Our correspondent writes, "It appears to have been entirely successful, by the Divine blessing, in every case upon this estate—viz., 124—up to the 11th of July (one old man only having died of the cholera, in whose case the treatment alluded to was not used.).....It is to administer thirty grains of ipecacuanha, and two grains of tartar emetic, as soon as possible, followed by quantities of warm water in the usual way, (i.e., from six to ten quarts,) and repeat the same dose if all the bad symptoms have not disappeared after the result of the first, (but which was not often requisite,) followed, next morning by a dose of castor oil. In some instances thirty drops of diluted sulphuric acid were administered after the emetic." The details of thirteen cases are appended to the report, and also the statement, that the manager of the estate was first led to adopt this treatment from finding it successful in the first two cases, which had been regarded as instances of poisoning.

HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, SEPTEMBER 9.—In the week ending Saturday last, 3413 persons died, or 2165 more than have on an average died in the corresponding week of former years. In addition to 2050 deaths from cholera, 276 persons have died of *diarrhœa*.

## TERMS FOR ADVERTISING.

The following is the Scale of Charges for Advertisements:—

For 7 lines and under.....	20 4 6	For half a page .....	£2 12 0
For every additional line ...	0 0 6	For a page .....	5 0 0

Advertisements which are intended to appear in *THE LANCET* of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of *THE LANCET* far exceeds that of any other Medical Journal in the world.

## TERMS OF SUBSCRIPTION TO "THE LANCET."

One Year .....	£1 14 8
Six Months .....	0 17 4
Three Months .....	0 8 8

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, *THE LANCET* Office, 453, Strand, London, and made payable to him at the Strand Post Office.

## TO CORRESPONDENTS.

THE extraordinary pressure upon our space this week has prevented us from inserting any account of the proceedings of the meeting of the Provincial Medical and Surgical Association, held at Manchester on the 13th and 14th instant.

*A Friend of Dr. Scott.*—Our correspondent writes as follows:—"The original plan proposed by Dr. Parkes, and submitted, I believe, by Dr. Scott to the Court of Directors, was a job still more objectionable than the one now consummated by the advice of Sir James Clark. It was, that certain schools of Medicine should have a number of appointments, proportioned to the number of pupils, to give away on the recommendation of the Professors. This was abandoned, on its being shown to be contrary to the Act of Parliament. But the appointment of Dr. Parkes and Mr. Paget, to a certain extent, carries out this principle; for who can doubt that the pupils of University College and St. Bartholomew's will have a far better chance of success than the pupils say of St. George's or Guy's?—and who will doubt, with such examiners as Dr. Parkes, Mr. Paget, and Mr. Busk, that a knowledge of cytoblasts, granular molecules and cells, will be far more esteemed than a sound knowledge of fever, dysentery, cholera, liver diseases, and other disorders incident to India?"

*Dr. W. Bishop.*—It is not likely, under such circumstances, that any mischief would result to the bitten person.

*Medicine, (Newcastle.)*—The disgraceful paragraph has not escaped us. We will inquire into the matter.

*J. K. B.*—If it be true that the authorities of Bow and Poplar have appointed two druggists to prescribe for persons affected with cholera, the fact should be distinctly stated, and the names of the parties given.

*Mr. H. Wilkinson.*—Our opinion remains unaltered. We shall publish Mr. Walker's decision, with remarks. In the case of *Gremaire v. Le Clerc* *bois Valon*, Garrow was for the plaintiff, and clearly admitted that his client was unlicensed. Lord Ellenborough's express opinion, "that the action was maintainable," has never, we believe, been overruled. The rule nisi afterwards obtained to set aside the verdict, which was for the plaintiff, did not touch the question of the plaintiff's right to recover. But it must be remembered, in addition to this, that the plaintiff in the late action at Rotherham was duly qualified to practise as an apothecary. We shall, on an early occasion, go further into this subject.

*H. A. T. (Reading)* is thanked for his communication, which we have made use of as he wished.

*Mr. S. Newham, (Bury St. Edmund's.)*—The proposals shall receive attention.

*A Young Surgeon.*—Mr. Coulson's work on "Lithotomy and Lithotomy."

*J. A. M.*—Under such circumstances, the guardians are not liable. Cannot the patient himself afford to pay?

*Truth* states that Dr. Ayton treated him, when suffering from cholera in 1832, precisely as Dr. Johnson now treats the disease.

*M.D., (Dover.)*—Our correspondent's inquiries about the German schools shall be answered next week.

*Mr. J. H. Tucker.*—Our space does not admit of the publication of the correspondence. The letters from the *Morning Post* were forwarded to us some time since, but we declined to re-publish them. It would appear that Mr. Bodington has clearly made out his claim to be the first person to recommend the employment of sulphuric acid in Asiatic cholera. We should be glad to see the pamphlet which Mr. Bodington published on the subject.

*Dr. E. Fowler.*—At present our space will not allow of the publication.

*An Old Subscriber.*—Though disinclined to enter into the subject, we have no difficulty in arriving at the conclusion, that Mr. Breary, if sinning, was much sinned against. The little pamphlet which he has circulated tends to show that his enemies were not over scrupulous of the means which they employed to overthrow him. The notes appended to the "Explanation" are from gentlemen well acquainted with the subject, and should be regarded accordingly.

*A Subscriber.*—The Manchester Royal Infirmary contains 200 beds. We cannot answer the other question this week.

*Mr. Critchett's* interesting and successful "Case in which Local Anaesthesia was employed in an Operation upon the Eye," and other papers and cases in type, are unavoidably postponed.

*A Subscriber to THE LANCET from its first Number.*—Much inconvenience would attend the carrying out of such a suggestion, which, however, would demand most serious consideration if the epidemic were not on the decline. Mr. Chaplin's communication arrived too late for insertion this week.

## THE CASTOR OIL TREATMENT OF CHOLERA.

To the Editor of THE LANCET.

SIR,—Do you think that Dr. George Johnson has added to his reputation by the recent puff in your daily contemporary? Purgatives and castor oil amongst them, have been tried at various times, without success, and in the late serious outbreak they were found equally unavailing.

Dr. Johnson has taken up an old plan of treatment, and applied it to a theory, which he has appropriated without the least acknowledgment. He hopes to settle the whole question by the results of *affirm* cases, taken, it may be remarked, not from any one quarter where the disease is raging in a virulent form, but scattered and isolated cases, which are well known to be by far the least fatal. His view of the nature of the disease, as many of your readers have already noticed, is obtained from the work of Mr. J. G. French, the "Nature of Cholera Investigated," first published in 1835, and of which a second edition appeared last year.

I append a few passages from Dr. Johnson's letter, and place them side by side with extracts from Mr. French's work.

DR. GEORGE JOHNSON.

"For, what reasonable explanation can we suggest for the phenomena of cholera except this,—that some mysterious poison enters the blood, which, while it exerts a powerful depressing and narcotic influence on the entire nervous system, in most cases excites a copious secretion into the stomach and intestines, whereby the poison is separated from the blood, and thus ejected from the body?"

And if this be the rational pathology of cholera, what treatment is so likely to be injurious as that which attempts by narcotics and astringents to arrest the discharges?

What procedure so full of promise as that which has for its object to favour and assist the elimination of the poison?

I may, however, remark in passing, that there is no relation between the degree of collapse and the amount of fluid which is lost by purging; that in many cases there is rather an inverse ratio between the collapse and the diarrhoea, and that the former often decreases and disappears while the latter continues with unabated rapidity.

A patient with a cold tongue has not a very delicate sense of taste, and we have had no difficulty in administering the medicine. It sometimes excites vomiting, and we have had such decided evidence that the effort of vomiting is beneficial, that we are rather gratified than otherwise with this result.

In every case we give cold water ad libitum."

Dr. Johnson would at least have shown better taste by referring to the source whence his views were drawn, instead of leaving it to be inferred that his plan of treatment arose necessarily out of a theory which was the result of his own experience and study. It is rather too bad that Mr. French's logical theory should be violently torn from him, and dressed up for the public taste, with castor oil, by Dr. Johnson.

Yours obediently,

M.D.

*ERRATUM.*—In the article "Langley on Bloodletting," in last week's *LANCET*, p. 208, first col., line 28, for 27th December, read 27th March.

COMMUNICATIONS, LETTERS, &c., have been received from—Sir G. Ballingall, (Albion); Dr. J. MacAdam, (Glasgow); Mr. Hamilton, (Milton, near Abington); Messrs. Woodhead and Worsnip, (Bradford); Mr. H. Wilkinson, (Rotherham, Yorkshire); Mr. C. W. Everett, (Salisbury); Mr. T. Wade, (Halifax Infirmary); Mr. C. Johnson, (Ousefleet, with enclosure); Mr. W. H. Tuckett, (Clydach); Mr. E. Payne, (Bath); Dr. McChie, (Glasgow); Mr. P. R. Giles, (Hereford); Omicron, (Lutterworth); Mr. A. Lindsay, (Glasgow, with enclosure); Mr. J. Horan, (Bromley); Mr. G. C. Sharman, (Wellingborough, with enclosure); Dr. Joseph Romilly; Dr. Alfred Hill; Dr. R. Fowler, Army Medical Department; Mr. W. Bishop; Dr. W. Sanders; Dr. Vernon; J. A. M.; A Subscriber to *THE LANCET* from its first Number; Dr. W. Smith; Q. Q. Q.; Mr. T. Chaplin; Mr. Theale; Bristol Medical School; Mr. B. Rogers; Mr. E. Hooker; W. C.; Association for Repealing Taxes on Knowledge; Mr. W. N. Torrione; Mr. John Aitken; Dr. Matthew Corner; University of Edinburgh; A Friend of Dr. Scott; Lector; Medicine, (Newcastle); J. K. B.; Mr. Mushet; H. A. T. (Reading); An Old Subscriber; A Twenty-one Year's Subscriber; Delta; A Young Surgeon; M.D., (Dover); A Subscriber; Truth; Mr. J. H. Tucker; Mr. S. Newham; M.D.; Mr. W. S. Waller; Mr. Wm. Cowan, (Detroit, U.S., with enclosure); &c. &c.

# DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,  
AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM,  
AND ALL SCROFULOUS DISEASES.

**A**pproved of and recommended by **BERZELIUS, LIEBIG, WOEHLER,**  
**JONATHAN PEREIRA, FOUQUIER,** and numerous other distinguished scientific Chemists.  
Prescribed by the most eminent Physicians, and supplied to the leading Hospitals of Europe.  
Specially rewarded with Medals by the Governments of Belgium and the Netherlands.  
Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—  
effecting a cure or alleviating symptoms much more rapidly.  
Contains iodine, phosphate of lime, volatile acid, and the elements of the bile—in short, all its most active and essential  
principles—in larger quantities than the Pale Oils made in England and Newfoundland, deprived mainly of these by their  
mode of preparation.

*The following Extracts are selected from some of the leading Medical and Scientific Testimonials in favour of*  
**DR. DE JONGH'S COD-LIVER OIL:—**

**BARON LIEBIG,**

Professor of Chemistry at the University of Giessen, &c. &c.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use."

The late

**Dr. JONATHAN PEREIRA,**

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

**Dr. FOUQUIER,**

Professor at the University of Paris, Physician to his late Majesty Louis Philippe, &c. &c.

"You have preserved to science the use of a medicine that might have fallen into utter discredit, in consequence of its unaccountable inaction in some cases."

**Dr. E. RIEGEL,**

Of Carlsruhe, Grand Duchy of Baden.

"This analysis has convinced me that Dr. de Jongh's Oil is not only prepared with greater care than the ordinary Cod-liver Oil, but that it contains in larger quantities those principles which are generally admitted to be most active and essential, so that it ought to be considered the most efficacious kind."

**Dr. SEGNIß,**

Of Geinhausen, Duchy of Hessen.

"I am bound to state that this Oil is greatly superior to all other kinds previously used by me, and that, therefore, the object aimed at by the use of this remedy is more surely attained by this Oil than by any other kind."

The

**INTENDANT OF THE CIVIL LIST OF BELGIUM.**

"The King has charged me to return you his very particular thanks for the homage done to him, by the presentation of your most valuable researches concerning the Cod-liver Oil: as an expression of his utmost satisfaction, he has given me the order of presenting you with the accompanying large Gold Medal."

**Dr. VAN DEN HUYDEN,**

Emmerich.

"I CAN conscientiously recommend it to my colleagues as being superior to all other kinds."

The

**MINISTER OF THE INTERIOR OF HOLLAND.**

"I HAVE the honour of bringing to your knowledge, that it has pleased the King to grant you, by his Decree of the 20th January, 1853, No. 101, a Silver Medal with an appropriate honorary inscription, as a testimony of his Majesty's high approbation for your efforts in securing to this country a supply of the most efficacious Cod-liver Oil from Norway. I have given the necessary orders for the execution of this Medal."

**THE ROYAL POLICE OF PRUSSIA.**

"THE Royal Police of Prussia (Königliches-Polizei-Præsidium) has the honour of informing you that it has caused the sample which you have forwarded to be submitted to an official investigation, and that the result of such investigation has proved it to be not only the genuine Cod-liver Oil, but still further, that it is of a kind which distinguishes itself from the Cod-liver Oil in ordinary use, alike by its taste and chemical composition."

**"THE LANCET,"**

(July 29th, 1864.)

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. IN THE PREFERENCE OF THE LIGHT-BROWN OIL OVER THE PALE OIL WE FULLY CONCUR."

"WE HAVE CAREFULLY TESTED A SPECIMEN OF THE LIGHT-BROWN COD-LIVER OIL, PREPARED FOR MEDICAL USE UNDER THE DIRECTION OF DR. DE JONGH, AND OBTAINED FROM THE WHOLESALE AGENTS, MESSRS. ANSAR, HARFORD, AND CO., 77, STRAND. WE FIND IT TO BE GENUINE, AND RICH IN IODINE AND THE ELEMENTS OF BILE."

**"THE MEDICAL TIMES,"**

(August 5th, 1854.)

"We believe that the profession are much indebted to Dr. de Jongh for his laborious researches into the composition and properties of this Oil; and we have the high authority of Baron Liebig and the late Dr. Pereira, in testimony of the value of these labours. In his zeal for investigating the properties of the Oil, Dr. de Jongh made a journey to Norway, and carefully examined its varieties, its mode of preparation, and its adulterations."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S Stamp and Signature, by

**ANSAR, HARFORD, & CO., 77, STRAND, LONDON,**

Sole Consignees and Agents for the United Kingdom and British Possessions, at the following prices:—

HALF-PINTS ... .. 2s. 6d. | PINTS ... .. 4s. 9d. | QUARTS ... .. 9s.

**IMPERIAL MEASURE.**

\* Hospitals and other Charitable Institutions requiring large quantities may be supplied on considerably reduced terms.

# CAUTION.

KNEE CAP AND ANKLE PIECE.

ABDOMINAL SUPPORTER.

SPINAL SUPPORTER.

STOCKING AND THIGH PIECE.

Mr. Bourjeaurd, in submitting the above four Engravings as illustrating the nature and special design of his Apparatuses, most earnestly begs to call the attention of Professional Gentlemen to the gross and nefarious practices of unprincipled parties, who attempt to impose on the Public by advertising their spurious apparatuses, accompanied with the closest imitations of his diagrams, and with the use even of the same words and plan of measurement, in order to obtain, by these fraudulent means, a portion of the patronage with which he has been especially honoured by the Profession. Mr. Bourjeaurd wishes, therefore, to caution Medical Gentlemen against the dishonest proceedings of his imitators, and hopes they will not accept any of the appliances put forward under the name of Spinal Supporter, except the articles come from his own Establishment, No. 11, Davies-street, Berkeley-square, (opposite Mivart's Hotel,) London; and No. 17, Rue des Beaux Arts, Paris.

**Mr. T. H. Wakley's Stricture Instruments.** Complete Sets of these Instruments may now be had of **WELLS & SON, 63, Strand, London.**

TO THE MEDICAL PROFESSION.

**Fr. G. Ernst, Anatomical Machinist** and MANUFACTURER OF SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam Eraser (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

**Surgical Instruments, and every** Implement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), Retail as well as Wholesale, from the Manufacturer, **JAMES ARNOLD, 35, WEST SMITHFIELD, ST. Bartholomew's Hospital, London.**

## Huxley's Fulcrum

ABDOMINAL BELT will be found, from its mechanical arrangement, (acting diagonally,) and producing the required support for the lower part of the Abdomen, to be the most complete and comfortable arrangement ever invented. It is extremely light, weighing only 4oz. Price 18s.

Measures required.—Circumference at A, B, and C; depth from A to C.

A discount of 20 per cent. to the profession.  
**HUXLEY and CO., 8, Old Cavendish-street, late of 5, Vere-street, Oxford-street.**

**Water Filter for the Pocket, with** DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.

**J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.**

**Anatomical and Dental Repository,** 45, Museum-street, Bloomsbury, London.—**JOHN HARNETT** begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

**When using Chloroform, if a cessation** of the Heart's action suddenly supervenes, the Inhalation of the Lungs with OXYGEN GAS will be more likely to restore animation than any other remedy.—**BARTH'S PATENT PNEUMATHIC APPARATUS** supplies Oxygen Gas in a compressed form, and will also measure and force it into the Lungs.—Send a Card and one Postage-stamp for a Prospectus, to George Barth, No. 4, Mornington-crescent, London.

**Dissecting and Post-Mortem Instruments.** New and Second-hand. Surgical Instruments of the best description; A. URE'S New Urethrotome for Stricture; New Uterine Compress; Newly Improved Pessary; Instruments for Army and Navy Surgeons; DARTNELL'S Patent Truss; Trusses for Union Surgeons; Enema Syringes; New Syphon Enema, as supplied to the Army; New Spinal Machine, pronounced the best ever invented.—at **PRATT'S, Surgical Instrument Maker, 480, Oxford-street.**

## Ladies' Belts. — Bailey's Elastic

**LADIES' BELTS** are found to be some of the most useful articles in his establishment. They are worn by those who are delicate in constitution, as they support the Back and Abdominal Muscles, giving the greatest possible comfort before and after Accouchement. They are without Buckles or any incumbrances, and easily adjusted. Prices, 18s., 32s., and 42s.

Those without Elastic are much used by Surgeons for persons immediately after Accouchement, and called Bailey's Compressing Belts. Price 10s. 6d., 15s., and 25s.

Hospitals and Lying-in Institutions supplied.

Females in attendance, and private rooms for trying on.

Address, **WM. HUNTLY BAILEY, 418, Oxford-street, London.**

## Teeth.—Mr. Alfred Jones, of Gros-

venor-street, has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by **MR. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.**

## St. Thomas's Medical Session. — A

General Introductory Address will be delivered by SAMUEL SOLLY, F.R.S., on Monday, 2nd October, 1854, at Eight o'clock P.M.

Gentlemen have the option of paying £40 for the first year, a similar sum for the second, and £10 for each succeeding year; or £90 at one payment, as Perpetual.

### SCHOLARSHIPS AND PRIZES FOR 1854-55.

A Scholarship of £20 for the best voluntary Classical and Mathematical examination, at the commencement of the Student's Hospital attendance.

Two Scholarships, for first year's men, each of the value of £20.

The Two House-Surgeons, the Fifteen Dressers, and the Resident Accoucheur, will be selected according to merit; and provided with Rooms and Commons in the Hospital, free of expense.

The President's Prizes. The first, 10 Guineas. The second, 5 Guineas.

Prizes and Certificates of Honour, in each of the different Classes.

Mr. Newman Smith's Prize, £5. The Cheselden Medal, and Dr. Roots' Prize, 10 Guineas.

The Treasurer's Prizes. The first, a Gold Medal. The second, 5 Guineas. And Three of 10 Guineas to Clinical Medical Clerks.

### MEDICAL OFFICERS.

Dr. Roots, Consulting Physician; Mr. Green, Consulting Surgeon; Dr. Barker, Dr. J. Ridsden Bennett, Dr. Goulden, Mr. South, Mr. Mackmurdo, Mr. Solly, Mr. Le Gros Clark, Mr. Simon, Dr. Peacock, Dr. Bristowe, Dr. Waller, Mr. Whitfield.

A Systematic Course of Clinical Medicine, with Clinical Instruction in the Wards—Dr. Barker. Ophthalmic Surgery, Mr. Mackmurdo; Midwifery, Dr. Waller and Dr. Griffiths.

Medicine—Dr. J. Ridsden Bennett.  
Surgery—Mr. South.  
Physiology—Mr. Grainger and Dr. Brinton.  
Descriptive and Surgical Anatomy—Mr. Le Gros Clark and Mr. Rainey.  
Chemistry and Practical Chemistry—Dr. R. Dundas Thomson.  
Midwifery—Dr. Waller.  
Practical Midwifery—Dr. Griffiths.  
Diseases of the Teeth—Mr. E. Saunders.  
General Pathology—Mr. Simon.  
Botany—Dr. Bristowe.  
Comparative Anatomy—Mr. Huxley.  
Materia Medica—Dr. Peacock.  
Forensic Medicine—Dr. Brinton.  
Anatomical Demonstrations—Mr. Rainey, Mr. Barwell, and Mr. Jones.  
Demonstrations in Morbid Anatomy—Dr. Bristowe and Mr. Jones.  
Microscopical Demonstrations—Mr. Rainey.

To enter, or to obtain further information, apply to Mr. WHITFIELD, Medical Secretary, resident at the Hospital.

## University College, London. —

FACULTY OF MEDICINE. SESSION, 1854-55.—The Classes will Commence on Monday, the 2nd of October. Introductory Lecture by Professor CARPENTER, M.D., at Three o'clock.

Classes in the order in which Lectures are delivered during the day:—

### WINTER TERM.

Anatomy—Professor Ellis.  
Anatomy and Physiology—Professor Sharpey, M.D., F.R.S.  
Chemistry—Professor Graham, F.R.S.  
Comparative Anatomy—Professor Grant, M.D., F.R.S.  
Surgery—Professor Erichsen.  
Medicine—Professor Walshe, M.D.  
Dental Surgery—Hubert Shelley, M.B.  
Practical Anatomy.—The pupils will be directed in their studies during several hours daily by Professor Ellis and Dr. Boon Hayce, Demonstrator.

### SUMMER TERM.

Botany—Professor Lindley, Ph. D., F.R.S.  
Pathological Anatomy—Professor Jenner, M.D.  
Paleo-Zoology—Professor Grant, M.D.  
Practical Chemistry—Professor A. W. Williamson, Ph. D.  
Midwifery—Professor Murphy, M.D.  
Forensic Medicine—Professor Carpenter, M.D., F.R.S.  
Ophthalmic Medicine and Surgery—Professor T. W. Jones, F.R.S.  
Materia Medica—Professor Garrod, M.D.

Analytical Chemistry—Professor Williamson, throughout the Session.  
Logic, French, and German Languages, Natural Philosophy, Geology, and Mineralogy.—according to announcement for the Faculty of Arts.

### CLINICAL INSTRUCTION.

Hospital Practice daily throughout the year.  
Physicians—Dr. Walshe, Dr. Parkes, and Dr. Garrod.  
Obstetric Physician—Dr. Murphy.  
Assistant-Physicians—Dr. Jenner, Dr. Hare.  
Surgeons—Mr. Quain, Mr. Erichsen.  
Consulting Surgeon to the Eye Infirmary—Mr. Quain, F.R.S.  
Ophthalmic Surgeon—Mr. Wharton Jones.  
Assistant-Surgeons—Mr. Marshall, Mr. Statham.  
Dental Surgeon—Mr. Shelley.  
Medical Clinical Lectures by Dr. Walshe and Dr. Garrod; also by Dr. Parkes, Professor of Clinical Medicine, whose special duty it is to train the pupils in the practical study of disease, and who gives a series of lessons and examinations on the Physical Phenomena and Diagnosis of Disease to classes consisting of a limited number, and meeting at separate hours.  
Surgical Clinical Lectures, specially by Mr. Quain; and by Mr. Erichsen.  
Lectures on Ophthalmic Cases, by Mr. Wharton Jones.  
Practical Instruction in the Application of Bandages and other Surgical Appliances, by Mr. Marshall.

Prospectuses may be obtained at the office of the College.  
RESIDENCE OF STUDENTS.—Several of the Professors receive students to reside with them; and in the office of the College there is kept a register of parties unconnected with the College who receive boarders into their families. Amongst these are several medical gentlemen. The register will afford information as to terms and other particulars.

G. VIVIER ELLIS, Dean of the Faculty.  
CHAS. C. ATKINSON, Secretary to the Council.

August, 1854.  
The Lectures to the Classes of the Faculty of Arts will commence on Tuesday, the 17th of October.  
The Junior School will open on Tuesday, the 26th of September.

## London Hospital Medical College. —

The WINTER SESSION will Commence on Monday, October 2nd, when an Inaugural Address on the opening of the New College will be delivered by Dr. LITTLE, at Three P.M.

### Medicine—Dr. Little.

Surgery—Mr. Curling, F.R.S., and Mr. Critchett.  
Descriptive and Surgical Anatomy—Mr. Adams.  
General Anatomy and Physiology—Dr. Carpenter, F.R.S.  
Practical Anatomy—Mr. N. Ward, Mr. Wordsworth, and Mr. Gowland.  
Chemistry—Dr. Letheby.  
Pathological Histology—Dr. Clark.  
Dental Surgery—Mr. Barrett.

### SUMMER SESSION, 1855, commencing May 1st.

Midwifery—Dr. Ramsbotham.  
Materia Medica—Dr. Davies.  
Forensic Medicine—Dr. Ramsbotham and Dr. Letheby.  
Botany—Mr. Bentley.  
Comparative Anatomy—Mr. Coles.  
Practical Chemistry—Dr. Letheby.

General fee to the Lectures, £50; to the Hospital Practice and Lectures, eighty-four guineas, payable in two instalments of forty-two guineas each, at the commencement of the two first Winter Sessions. Applications by post to be made to the Honorary Secretary.

## St. Bartholomew's Hospital and

MEDICAL COLLEGE.—The WINTER SESSION will Commence on October 2nd, with an Introductory Address by Dr. BURROWS, at seven o'clock P.M.

### LECTURES.

Medicine—Dr. Burrows.  
Surgery—Mr. Lawrence.  
Descriptive Anatomy—Mr. Skye.  
Physiology and Morbid Anatomy—Mr. Paget.  
Chemistry—Mr. Stenhouse.  
Superintendence of Dissections—Mr. Holden and Mr. Coote.

### SUMMER SESSION, 1855, Commencing May 1st.

Materia Medica—Dr. Roupell.  
Botany—Dr. F. Farre.  
Forensic Medicine—Dr. Baly.  
Midwifery, &c.—Dr. West.  
Comparative Anatomy—Mr. M'Whinnie.  
Practical Chemistry—Mr. Stenhouse.  
Natural Philosophy—Dr. Martin.

HOSPITAL PRACTICE.—The Hospital contains 650 beds, and relief is afforded to nearly 90,000 patients annually. The in-patients are visited daily by the Physicians and Surgeons, and Clinical Lectures are delivered weekly; those on the medical cases, by Dr. Roupell, Dr. Burrows, and Dr. Farre; those on the surgical cases, by Mr. Lawrence, Mr. Stanley, Mr. Lloyd, and Mr. Skye. The out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

COLLEGIATE ESTABLISHMENT.—Warden, Dr. BLACK. Students can reside within the Hospital walls, subject to the rules of the Collegiate system, established under the direction of the Treasurer and a Committee of Governors of the Hospital. Some of the teachers and other gentlemen connected with the Hospital also receive students to reside with them.

SCHOLARSHIPS, PRIZES, &c.—At the end of the Winter Session, examinations will be held for two Scholarships of the value of £45 for a year. The examination of the classes for prizes and certificates of merit, will take place at the same time.

Further information may be obtained from Mr. Paget, or any of the Medical or Surgical Officers or Lecturers, or at the Anatomical Museum or Library.

## King's College, London. — Medical

DEPARTMENT.—The WINTER SESSION, 1854-5, will Commence on Monday, October 2, 1854.

### The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.  
Physiology and General and Morbid Anatomy—Professors W. Bowman, F.R.S., and Lionel S. Beale, M.B.  
Chemistry—Professor W. A. Miller, M.D., F.R.S.  
Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.  
Principles and Practice of Surgery—Professor William Ferguson, F.R.S.  
Logic and Natural Philosophy, as required by the Army Medical Board.

### KING'S COLLEGE HOSPITAL.

The new Out-patient Department, and a large portion of the new building, will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by Professors Partridge and Ferguson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience for the attainment of Practical Chemistry, and for the prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the next Winter Session will have the exclusive privilege of contending for three Warneford Scholarships of £25 per annum, for three years. The subjects for the examination, which will commence on September 30, are, Divinity, Classics, Mathematics, History, and Modern Languages, equal marks being assigned to each subject. The classical books fixed on by the examiners for this year are the same as those announced for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £20, and three of £20 each, tenable for two years, will be filled up in April next, the subjects of the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or upon application to J. W. Cunningham, Esq., Secretary.

June, 1854.

R. W. JELF, D.D., Principal.

## University of London, &c.—A First

CLASS B.A. and M.D., prepares Gentlemen, privately or in class, for the Matriculation, Medical, and Arts Examinations, the Fellowship Examinations, &c. Full MS. and printed notes forwarded. One Vacancy for a PRIVATE PUPIL, who may be Apprenticed.—Address A. Z., Ferriman's, 40, Albany-street, Regent's-park.

## St. George's Hospital Medical School,

LONDON.—SESSION, 1854-55.

The WINTER COURSE of INSTRUCTION will commence on Monday October 2nd, when the SCHOLARSHIPS and PRIZES for the past year will be awarded.

The Hospital contains 350 beds. Attendance of the Physicians and Surgeons daily, at One o'clock. Surgical Operations on Thursday, at One o'clock.

A Maternity Department, for the delivery of married lying-in women at their own homes, is established at the Hospital, under the superintendence of the Obstetric Physician.

Gentlemen becoming Pupils of the Hospital may attend all the Lectures, and the Medical and Surgical Practice necessary for those who desire to become Members of the Royal College of Surgeons, or Licentiates of the Society of Apothecaries, on paying Forty Guineas at the commencement of the first year, Forty Guineas at the commencement of the second year, and Twelve Guineas at the commencement of the third year.

The payment for the year will admit the Pupil to all the Lectures, and to the Hospital Practice required, for that year only.

Special entries to Hospital Practice, or to any separate Course of Lectures, may be made as heretofore.

Some of the Lecturers and other gentlemen connected with the Hospital receive Students to reside with them.

Further information may be obtained from the Secretary of the Hospital, or from Mr. Hammerton, the Apothecary of the Hospital, who is authorized to enter the names of Students.

## School of Anatomy and Medicine,

adjoining St. George's Hospital, 1, Grosvenor-place.—The WINTER SESSION will commence on Monday, October 2nd, 1854.

Anatomy and Physiology—Dr. Lankester and Mr. Blenkins, assisted by Mr. Lane.

Descriptive and Surgical Anatomy—Mr. Blenkins and Dr. Deville.

Chemistry—Mr. J. E. D. Rodgers and Dr. Marcet.

Medicine—Dr. Cormack and Dr. Ballard.

Surgery—Mr. Pilcher and Mr. Spensor Wells.

Midwifery—Mr. Bloxam.

Materia Medica—Dr. Ballard.

Forensic Medicine—Dr. B. W. Richardson.

Botany—Dr. Lankester.

Practical Chemistry—Mr. J. E. D. Rodgers.

Comparative Anatomy and Zoology—Mr. B. T. Hulme.

For further particulars and prospectuses, apply to Dr. Lankester, 22, Old Burlington-street; Mr. R. W. Burford, at the School, 1, Grosvenor-place; or at the residences of the respective Lecturers.

## Westminster Hospital Medical

SCHOOL.—The WINTER SESSION will commence on Monday, October 2nd, 1854, with an Introductory Address by Mr. BARNARD HOLT, at Seven o'clock P.M.

The Hospital affords relief to about 2000 In-patients, and 16,000 Out-patients annually.

The School premises have been greatly improved since the last Session, and considerable additions have been made to the Museums of Anatomy and Materia Medica.

Fee for attendance on all the Lectures and Hospital Practice required by the College of Surgeons and Society of Apothecaries, £71 8s. This sum may be paid at once, or by instalments of £30 at the commencement of the first Session; £30 at the commencement of the second Session, and the remainder at the commencement of the third Session.

Some of the Lecturers, and other Gentlemen in the neighbourhood of the Hospital, receive Students to reside with them.

Further information may be obtained from Mr. Holthouse, 9, New Burlington-street, from any of the other Lecturers, or from

F. J. WILSON, Secretary to the Hospital.

## Charing-cross Hospital Medical

SCHOOL, WEST STRAND, LONDON.

WINTER SESSION, October, 1854, to March, 1855.

Chemistry—H. H. Lewis, A.M.

Anatomy—Mr. E. Canton.

Demonstrations and Dissections—Mr. Goldsbro.

Surgery—Mr. Hancock.

Physiology and Pathology—Dr. Hyde Salter.

Medicine—Dr. Chowne and Dr. Rowland.

SUMMER SESSION, May, 1855, to the end of July.

Practical Chemistry in the Laboratory—H. Lewis, A.M.

Materia Medica—Dr. Steggall and Dr. Willsheire.

Botany—F. W. Headland, B.A.

Midwifery, &c.—Dr. Chowne and Mr. Hird.

Medical Jurisprudence—Dr. G. Birkett and Mr. Hird.

All the Lectures required by the College of Surgeons and Society of Apothecaries, £45, without Practical Chemistry, which is £2 2s.

HOSPITAL PRACTICE.

Consulting-Physician—W. Shearman, M.D.

Physicians—Dr. Golding and Dr. Chowne.

Assistant-Physician—Dr. Rowland.

Surgeons—Mr. Hancock and Mr. Avery.

Assistant-Surgeon—Mr. E. Canton.

MEDICAL PRACTICE.—Full period required, £15 15s. Surgical, £15 15s. Both Medical and Surgical, £26 5s.

JOHN ROBERTSON, Hon. Sec.

## House-Pupil.—Dr. Steggall will have

a Vacancy for a RESIDENT PUPIL in October next. Unusual advantages and assistance will be afforded for Study and Improvement.—For terms apply to Dr. S., 2, Southampton-street, Bloomsbury-square, London.

## Guy's and St. Thomas's.—A Phy-

sician attached to one of the above Hospitals, in the immediate vicinity of which he resides, is desirous of receiving one or two PUPILS, whose Medical Studies he will superintend.—For Cards of Address, apply to Mr. Rouse, 9, Wellington-street, London-bridge.

## Mr. G. Hind, F.R.C.S., will resume

his DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.

Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

## The City and Borough Hospitals.—

A Hospital Physician, possessing ample means of instruction, who is acquainted by personal experience with the requirements of all the London Examining Boards, including the University of London, and whose residence is most conveniently situated in reference to the City and Borough Hospitals, has a Vacancy for a PUPIL.—For terms, &c., apply to Dr. Barnes, 13, Devonshire-square.

## Medical College, Royal Free Hos-

PITAL.—During the WINTER SESSION, 1854-55, whilst this Institution is undergoing the alterations and extensions required by the Royal College of Surgeons,

COURSES of PRACTICAL INSTRUCTION on ANATOMY and SURGERY will be given by Dr. KNOX (late Lecturer on Anatomy, Edinburgh), and by Mr. GARR, Co-Lecturers on Anatomy and Physiology.

Terms and any further particulars may be obtained on application at the Office of the College.

## The Royal London Ophthalmic

HOSPITAL, MOORFIELDS. FOUNDED 1804.

Consulting Physician—Dr. Farre. | Physician—Dr. F. J. Farre.

Surgeons—G. W. Mackmurdo, Esq., F.R.S.; J. Dixon, Esq.; G. Critchett, Esq.;

W. Bowman, Esq., F.R.S.; A. Poland, Esq.

Assistant-Surgeon—J. C. Wordsworth, Esq.

During the past year, 10,421 Patients were treated at this Hospital, and 360 Operations performed, 183 being for Cataract. The Patients are seen daily at Nine o'clock, and Operations performed on Fridays at Ten.

Fee for attendance on the Practice for ONE YEAR, or with the consent of the Medical Officers for an unlimited period, £5 5s.: for THREE MONTHS, £3 5s.

## Kelvedon School, Essex.

Conducted by Mr. W. WISEMAN, M.C.P.

The Studies of Young Gentlemen intended for the Medical Profession are so arranged at this Establishment as to qualify them, on leaving, for passing the Preliminary Examination at the University of London or Apothecaries' Hall.

Terms, from Thirty Guineas to Fifty Guineas per annum, according to the accommodation, &c., required.

## Lectures and Demonstrations on the

THEORY AND PRACTICE OF CHEMISTRY.

JOHN MACADAM, M.D., (of the University of Glasgow, and Licentiate of the Faculty of Physicians and Surgeons,) will commence, on Wednesday, 1st November, at Ten o'clock A.M., his Winter Scientific Course of Lectures and Demonstrations on the Theory and Practice of Chemistry, to be continued Daily for Six Months. Oral Examinations Weekly.

Fee, £2 2s.

Dr. Macadam's Courses of Instruction in Practical Medical Chemistry begin in February and in May. The Laboratory is open daily, from Ten A.M. till Four P.M.

Chemistry Class-rooms, High John-street, Glasgow.

## A Course of Instruction on the

THEORY AND PRACTICE OF MEDICAL GYMNASTICS will be commenced, at the Institution, 16A, Old Cavendish-street, by Dr. BOTH, on Monday, the 2nd of October, at 6 P.M., and continued every Monday and Friday, during the months of October, November, and December.

This Course is open to all Medical Students and Professional Men.

Terms, Five Guineas.

## DR. BOTH'S WORKS ON MEDICAL AND EDUCATIONAL GYMNASTICS.

1. The PREVENTION and CURE of MANY CHRONIC DISEASES by MOVEMENTS. With Ninety Illustrations. Price 10s. London: John Churchill, New Burlington-street.

2. On the IMPORTANCE of RATIONAL GYMNASTICS. Price 1s.

3. The GYMNASTIC FREE EXERCISES of TRING. Price 2s. 6d.

4. MOVEMENTS for the DEVELOPMENT of the BODY in CHILDHOOD and YOUTH. Price 1s.

5. THREE SHEET TABLES, ILLUSTRATING GYMNASTIC EXERCISES WITHOUT APPARATUS.

In the Press,

NOTES on the SWEDISH MEDICAL GYMNASTICS. With 120 Engravings.

Groombridge and Sons, 5, Paternoster-row.

## St. Mary's Hospital and Medical

SCHOOL.—The WINTER SESSION will Commence on Monday, the 2nd of October, over an Introductory Address by Dr. ALDERSON, F.R.S., at Half-past Two o'clock.

### LECTURES.

Anatomy and Physiology—Mr. Lane and Dr. Handfield Jones.  
Descriptive and Surgical Anatomy—Mr. Haynes Walton and Mr. James Lane.  
Pathological Anatomy—Dr. Markham.  
Chemistry—Dr. Albert J. Bernays.  
Medicine—Dr. Chambers and Dr. Sibson.  
Surgery—Mr. Coulson and Mr. Spencer Smith.  
Clinical Medicine—Dr. Alderson.  
Clinical Surgery—Mr. Ure.

### SUMMER SESSION, 1855, commencing May 1st.

Botany—Dr. J. S. Burdon Sanderson.  
Materia Medica—Dr. Sieveking.  
Practical Chemistry—Dr. Albert J. Bernays.  
Midwifery, &c.—Dr. Tyler Smith and Mr. I. Baker Brown.  
Medical Jurisprudence—Mr. Ancell.  
Military Surgery—Dr. James Bird, F.R.C.S.E.  
Ophthalmic Surgery—Mr. White Cooper.  
Aural Surgery—Mr. Toynbee.  
Dental Surgery—Mr. Nasmyth.  
Comparative Anatomy—  
Natural Philosophy—

HOSPITAL PRACTICE.—The Hospital contains upwards of 150 beds, 65 of which are devoted to Medical, and the rest to Surgical, cases. This division includes a ward appropriated to the Diseases of Women, and also beds for Ophthalmic and Aural cases. A Maternity Department is attached to the hospital: 218 poor married women were delivered at their own homes during the past year. The in-patients are visited daily by the Physicians and Surgeons at one o'clock. Lectures on Clinical Medicine will be regularly delivered by Dr. Alderson, and on Clinical Surgery, by Mr. Ure; and occasionally by the other Medical Officers in their respective departments. The Out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

There are three Resident Medical Officers, who board in the hospital, and are appointed for eighteen months; two non-resident Medical Officers; a Medical and a Surgical Registrar. Clinical Clerks and Dressers will be selected from the best-qualified Students. All the above offices are open to competition amongst the qualified Perpetual Pupils of the hospital, without extra fee.

Further information may be obtained on application to the Dean of the School, who will also furnish the names of gentlemen in practice in the vicinity of the hospital, willing to receive Pupils to reside with them.

St. Mary's Hospital,  
Aug. 8th, 1854.

H. SPENCER SMITH,  
Dean of the School.

## Royal Veterinary College, College-

STREET, CAMDEN-TOWN, LONDON.—The LECTURES will Commence at the above Institution on Monday, October 16th, 1854, at Twelve o'clock.

Anatomy, Physiology, and Pathology of the Horse—Professor Spooner.  
Anatomy, Physiology, and Pathology of the Domesticated Animals—Professor Simonds.  
Chemistry and Materia Medica—Professor Morton.  
Descriptive Anatomy—Assistant-Professor Varnell.

The Introductory Address will be delivered by Professor MORROX, at Twelve o'clock.

Perpetual Fee to all the Lectures, with Infirmary Practice and Anatomical Demonstrations daily, Twenty Guineas.

## Queen's College, Birmingham.—

The WINTER SESSION will commence on Tuesday, the 3rd day of October next, when an Introductory Address will be delivered at Two o'clock, by R. D. GRAYSON, Esq., F.R.S.

The system of study pursued at this College constitutes a complete course of Collegiate, Medical, and Surgical education. The Lectures qualify for Examination for appointments in the Army and Navy and the East India Company's Service, for the Degrees of M.B. and M.D. of the University of London, for the Diploma of the Royal College of Surgeons, and the License of the Society of Apothecaries, without any residence elsewhere.

A married Tutor, in Holy Orders, a Graduate of Oxford, resides within the walls of the College, to whom is committed by the Council the superintendence of all Resident Students, under Collegiate discipline, and also the surveillance of Non-Resident Students.

### THE WINTER SESSION.

Surgical Anatomy—Professor Sands Cox, F.R.S., Fellow of the Royal College of Surgeons of England; Senior Surgeon of the Queen's Hospital.  
Descriptive Anatomy—Professor Parker, Fellow of the Royal College of Surgeons of England; Surgeon to the Queen's Hospital.  
General Anatomy and Physiology—Professor Heslop, M.D., Physician to the Queen's Hospital.

Practical Anatomy, with Superintendence of Dissections—Mr. David Bolton, Fellow of the Royal College of Surgeons; and Mr. Walter Careless Freer, M.R.C.S.

Chemistry—Professor George Shaw, Fellow of the Geological Society.  
Principles and Practice of Medicine—Professor James Johnstone, M.D., (Cantab.), Fellow of the Royal College of Physicians of London; Senior Physician to the General Hospital.

Principles and Practice of Surgery—Professor Sands Cox, F.R.S., Senior Surgeon to the Queen's Hospital.

Medical Tutor—R. C. R. Jordan, M.R.C.S., M.B.

Clinical Lectures will be delivered Weekly, by the Professors.

CHEMICAL LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience, for the attainment of a knowledge of Practical Chemistry, and for the prosecution of Scientific researches. The Students have also, under certain regulations, access to the Botanical Gardens.

For further information, application may be made to Mr. Sands Cox, Dean of the Faculty, 24, Temple-row; or to Mr. Langston Parker, Honorary Secretary to the Professors, 20, Colmore-row, Birmingham; from whom may be obtained, on receipt of two penny stamps, the Prospectuses of the Medical Departments.

## Marischal College and University.—

(Charter ratified by Act of Parliament, A.D. 1593).—FACULTY OF MEDICINE.—WINTER SESSION of 1854-55 commences on the first Monday of November.

### CLASSES.

Anatomy—Professor A. J. Lizars. 12 noon.  
Practical Anatomy and Anatomical Demonstrations—Professor A. J. Lizars and Dr. Beveridge. 2 P.M.  
Chemistry—Dr. Clark, Mr. Brazier (Assistant). 3 P.M.  
Practical Chemistry—Dr. Clark and Mr. Brazier. 11 A.M.  
Materia Medica—Dr. Henderson. 9 A.M.  
Institutes of Medicine—Dr. Ogilvie. 4 P.M.  
Practice of Medicine—Dr. Macrobain. 3 P.M.  
Principles and Practice of Surgery—Professor Pirrie. 1 P.M.  
Midwifery, and Diseases of Women and Children—Dr. Dyce. 4 P.M.  
Natural History—Professor Nicol. 11 A.M.

The SUMMER SESSION of three months' duration commences in May. Hospital Practice daily at 10 A.M., at the Royal Infirmary, containing upwards of 290 beds.

Fee, £5 5s., to be paid in one, or in separate payments of £2 2s. at the commencement of each Session.

The Courses at this University qualify for Examination at the several Universities, Colleges of Surgeons, and Boards of the Public Services, and at Apothecaries' Hall.

Graduates who have attended the several Medical Classes in this University are charged no Graduation Fees.

The Examination Term will be held in the third week of October.

For particulars, in the case both of students and practitioners, application may be made to the Secretary of the University.

## University and King's College,

ABERDEEN.

### MEDICAL SCHOOL.

The WINTER SESSION commences on the first Monday of November, and terminates on the third Friday of April. Introductory Lecture on the first Monday of November, at Two o'clock P.M.

Midwifery—Dr. Rainy. 8 to 9 A.M., £3 3s.  
Anatomical Demonstrations—Dr. Redfern. 9 to 10 A.M., £2 2s.  
Chemistry—Dr. Fyfe. 10½ to 11½ A.M., £3 5s. 6d.  
Materia Medica—Dr. Templeton. 12 to 1 P.M., £3 3s.  
Practice of Medicine—Dr. Williamson. 1 to 2 P.M., £3 3s.  
Anatomy and Physiology—Dr. Redfern. 2 to 3 P.M., £3 3s.  
Surgery—Dr. Kerr. 3 to 4 P.M., £3 3s.  
Institutes of Medicine, (Physiology)—Dr. Christie. 4 to 5 P.M., £3 3s.

### SUMMER SESSION.

Botany—Rev. J. C. Brown. 8 to 9 A.M., £2 2s.  
Practical Chemistry—Dr. Fyfe. 12 to 1 P.M., £3 5s. 6d.  
Anatomical Demonstrations—Dr. Redfern. 2 to 3 P.M., £2 2s.  
Medical Jurisprudence—Dr. Reid. 3 to 4 P.M., £2 2s.  
Histology—Dr. Redfern.  
Natural Philosophy—David Thomson, M.A. £2 2s.  
Natural History—Rev. J. Longmuir.

The rooms for Practical Anatomy are personally superintended by Dr. Redfern.

Students are required to matriculate within the first month of the Winter Session, and within the first fortnight of the Summer Session, and no certificate of attendance will be given without such matriculation. The Matriculation Fee for all the Classes is one sum of 5s. for the Winter, and one of 2s. 6d. for the Summer Session.

Chemistry will be taught, as formerly, in King's College; and other Classes, in the Medical School, St. Paul-street.

### ROYAL INFIRMARY.

The Hospital is open daily at Ten o'clock, A.M., and contains upwards of 300 beds. Separate Courses on Clinical Medicine and Clinical Surgery are delivered in the Hospital three times a-week.

#### PHYSICIANS.

Dr. Dyce.  
Dr. Kilgour.  
Dr. W. Williamson.  
Dr. Nicol.

#### SURGEONS.

Wm. Keith, Esq.  
Wm. Pirrie, Esq.  
David Kerr, Esq.  
A. J. Lizars, Esq.

Ophthalmic Surgeon—John Cadenhead, Esq.  
Lecturers on Clinical Medicine and Surgery:—  
Mr. Kilgour. Wm. Keith, Esq.

Fee for the Medical and Surgical Practice of the Hospital, 1st year, £3 3s.; 2nd year, making perpetual, £3 3s.; or one sum of £5 5s.

Clinical Medicine—for each of the three first Courses, £1 1s., making perpetual; or one payment of £2 2s. perpetual.

Clinical Surgery—for each of the three first Courses, £1 1s., making perpetual; or one payment of £2 2s. perpetual.

### DISPENSARY.

The ABERDEEN GENERAL DISPENSARY, VACCINE, and LYING-IN INSTITUTION is open to the Student on application to the Medical Officers. There are annually about 5000 patients, either prescribed for at the Institution or visited at their own houses.

### LUNATIC ASYLUM.

The Asylum contains about 240 patients. A limited number of Students are admitted to see the practice. Fee, for a Course of Three Months, £1 1s.

Consulting Physician—Dr. Macrobain.

Resident Physician and Superintendent—Dr. Robt. Jamieson.

The Library of the University contains about 45,000 volumes, and is free to all the Students of King's College.

The Medico-Chirurgical Society possesses a valuable Medical Library of nearly 4000 volumes, and a Reading-Room, to both of which, and to all the privileges of Junior Members, Students are admitted on payment of £1 1s. per year, becoming free members after three payments.

JOSEPH WILLIAMSON,  
Secretary to Medical Lecturers, King's College.

King's College, Aberdeen, Sept. 1854.

**Glasgow University. — Faculty of**  
**PHYSICIANS AND SURGEONS.**—Dr. ALEXANDER LINDSAY  
will continue, during the ensuing Session, to give instructions to Gentlemen  
desirous of revising their studies previously to their going before the Examining  
Boards.  
95, George-street, Glasgow, Sept. 11th, 1854.

**Glasgow Royal Infirmary. — The**  
**WINTER SESSION, 1854-5, commences on the 1st of November.**  
Physicians—Dr. Ritchie, Dr. Easton, Dr. Bell, Dr. M'Gregor, and Dr. Weir.  
Surgeons—Dr. A. Buchanan, Dr. Hunter, Dr. Fleming, Wm. Lyon, Esq., and  
Dr. Corbett.  
Medical Superintendent—Dr. J. M'Ghie.

The physicians and surgeons visit the wards daily, at two P.M.  
The physicians give Clinical Lectures on the Medical Cases on Mondays and  
Thursdays, at three P.M.  
The surgeons give Clinical Lectures on the Surgical Cases on Tuesdays and  
Fridays, at three P.M.  
The Post-mortem Examinations are made under the direction of the medical  
attendant in presence of the students.  
Students have the opportunity of acting as dressers to the surgeons, without  
fee; also of acting as clerks to the surgeon prescribing for the out-patients.  
FEE.—Perpetual, £8 8s.; for one year, £5 5s. Perpetual to those who have  
previously entered for one year, £3 13s. 6d.; for six months to holders of  
surgical diplomas, £2 2s.

**MEDICAL SCHOOL.**

**Anderson's University, Glasgow.—**  
The WINTER SESSION will begin on Tuesday, November 7th, 1854.  
Lectures will be delivered daily for six months on the following branches of  
Medical Science:—

Anatomy..... } Dr. M. S. Buchanan  
Anatomical Demonstrations..... } and  
Practical Anatomy..... } Dr. George Buchanan.  
Surgery—Dr. Hunter.  
Principles and Practice of Medicine—Dr. A. Anderson.  
Institutes of Medicine—Dr. Eben. Watson.  
Materia Medica, Pharmacy, and Dietetics—Dr. Easton.  
Chemistry—Dr. Penny.  
Practical Chemistry—Dr. Penny.  
Midwifery and Diseases of Women and Children—Dr. Paterson.  
Medical Jurisprudence and Police—Dr. Crawford.  
Natural Philosophy (three times a week)—Dr. Taylor.  
Mathematics—Mr. Laing.

Summer Courses of Anatomy, Midwifery, Chemistry, Materia Medica, and  
Botany, begin in May.

Botany—Mr. Bell.

Fee for each Class, £2 2s. Perpetual, £3 3s.

The general Fee for all the classes required for passing the College or Hall,  
including Hospital Practice, amounts to £40.

Certificates of attendance on the above courses are received by the Universities  
of Oxford, Cambridge, London, Aberdeen, and St. Andrew's; by all the  
Royal Colleges of Surgeons in Great Britain and Ireland; by the Faculty of  
Physicians and Surgeons in Glasgow; and by the Army, Navy, and East  
India Boards; and the Apothecaries' Company.

Students attending the Medical Classes have the opportunity of witnessing  
the practice of the following hospitals:—viz., Lying-in Hospital, 10s. 6d. for  
six months; Eye Infirmary, £2 2s. for six months; Royal Infirmary, £8 8s. for  
two years, including Medical and Surgical Clinical Lectures, which are de-  
livered four times weekly. The patients admitted to the Eye Infirmary  
average 1100 annually; those admitted to the Royal Infirmary, nearly 3000;  
besides 6000 out-patients treated at the Dispensary. Average number of  
surgical operations 200 annually.

The Dissecting-room is free to those attending either of the above Courses  
of Anatomy, and attached to it there is a Reading-room and Museum for the  
use of the Anatomical Students. A valuable Medical Library is also attached  
to the Medical School.

The new and extensive Laboratory of the Institution, fitted up expressly  
for gentlemen desirous of pursuing Practical and Analytical Chemistry, is open  
daily from eleven till four o'clock. No charge for apparatus and materials in  
the class for Practical Medical Chemistry.

The University Museum, a splendid collection of specimens of Natural History,  
including more particularly those of Zoology, Mineralogy, and Anti-  
quities, is open to all Students attending the University.

Further information may be obtained by applying to Dr. ANDREW ANDERSON  
2, Woodside-crescent, Glasgow.

**Queen's College, Cork.**  
**SESSIONS 1854-1855.**  
**MATRICULATION AND SCHOLARSHIP EXAMINATIONS.**

On Tuesday, the 17th of October next, at Ten o'clock A.M., an Examination  
will be held for the Matriculation of Students in the Faculties of Arts,  
Medicine, and Law, and in the Departments of Civil Engineering and  
Agriculture.

The Examinations for Scholarships will commence on Tuesday, 17th October.  
The Council have the power of conferring at these Examinations Ten Senior  
Scholarships of the value of £40 each—viz., Seven in the Faculty of Arts, Two  
in the Faculty of Medicine, and One in the Faculty of Law; and Forty-five  
Junior Scholarships—viz., Fifteen in Literature, and Fifteen in Science, of  
the value of £24 each; Six in Medicine, Three in Law, and Two in Civil  
Engineering, of the value of £20 each; and Four in Agriculture, of the value  
of £15 each.

Prospectuses, containing full information as to the subjects of the Examina-  
tions, &c., may be had on application to the Registrar.

By order of the President,

ROBERT J. KERRY, Registrar.

Sept. 8th, 1854.

**Royal College of Surgeons, Ireland.**

President—Charles Benson.

Vice-President—Sir Philip Crampton, Bart.

The Council—Alexander Read, Arthur Jacob, A. Ellis, R. C. Williams, R.  
Adams, J. Barker, W. Colles, J. H. Power, Edward Hutton, J. Macdonnell,  
H. Irvine, J. S. Hughes, Robert Pentland, Robert Mayne, Richard G. H.  
Butcher, Augustus E. Tabuteau, Samuel G. Wilmot.

Honorary Secretary of the College—Edward Hutton.

Secretary of the Council—Henry Maunsell.

Court of Examiners—T. Rumley, C. Fleming, O'Brien Bellingham, R.  
Tuohill, Thomas Byrne, Francis Baileys, M. H. Stapleton.

Examiners in Midwifery—W. Jameson, Alfred McClintock, Samuel L. Hardy.

**PROFESSORS.**

Anatomy and Physiology—Arthur Jacob.

Descriptive Anatomy—J. H. Power.

Surgery—W. H. Porter and W. Hargrave.

Medicine—C. Benson.

Chemistry—W. Barker.

Materia Medica—R. C. Williams.

Midwifery—T. Beatty.

Medical Jurisprudence—T. G. Geoghegan.

Botany—A. Mitchell.

Logical Science—J. Murray, LL.D.

Fellows of the College are members of the Corporation, and are admitted by  
examination, letters testimonial are granted to licentiates; and a diploma in  
midwifery to fellows and licentiates educated and examined in that branch of  
surgery.

Candidates for the Fellowship must be twenty-five years of age, and must  
give proof of liberal preliminary education, and good conduct during pro-  
fessional education. They are required to produce certificates of surgical  
studies for six years, (three of which must be for exercises in Dublin,) and  
also of practice as house-surgeon or dresser in an hospital; as well as certificates  
of attendance on hospitals, lectures, and dissections, as required from licentiates;  
with the addition of Botany, Comparative Anatomy, and Natural Philosophy.  
Fee, £28 5s.; if the candidate be a licentiate, £10 10s.

Candidates for Letters Testimonial are required to produce certificates of  
preliminary classical education; of four years' professional study, (three of  
them in metropolitan schools;) also three years' attendance on hospital  
lectures and dissections. Fee, £21.

Candidates for the Midwifery Diploma must be fellows or licentiates of the  
College, and are required to produce certificates of attendance on midwifery  
lectures and practice, with proof of having attended thirty cases of parturition.

Candidates for the Fellowship and Letters Testimonial are publicly examined,  
on two separate days, in Anatomy, Physiology, Surgery, Practice of Medicine,  
and Pharmacy. The examiners are elected by a sworn jury of the Council  
and appointed by lot, teachers being ineligible. Fellows and licentiates of  
the College are qualified to practise as surgeons in any part of the British  
dominions, and to be appointed medical officers to the army and navy, public  
hospitals, infirmaries, dispensaries, and workhouses.

**Royal College of Surgeons in Ireland.**  
**SCHOOL OF SURGERY—SESSION 1854-55.**

The Dissecting Rooms will be opened on the 2nd of October, and the Lec-  
tures will commence on the 30th.

Anatomy and Physiology—Dr. Jacob.

Descriptive Anatomy—Dr. Power and Dr. Bevan.

Surgery—Mr. Porter and Mr. Hargrave.

Practice of Medicine—Dr. Benson.

Chemistry—Dr. Barker.

Materia Medica—Dr. Williams.

Midwifery—Dr. Beatty.

Medical Jurisprudence—Dr. Geoghegan.

Practical Chemistry—Dr. Barker.

Comparative Anatomy—Dr. Jacob.

Botany—Dr. Mitchell.

Logical Science—John Murray, A.M., LL.D.

Dissections under the direction of the Professors of Anatomy, assisted by  
the Demonstrators, Messrs. Hargrave, Malcolmsen, Morgan, and Mapother.

The Fee for each of the above Courses is Two Guineas.

The SUMMER SESSION will commence in April, and terminate in July.

For further information, application to be made to any of the Professors, or  
to the Registrar.

By order,

W. BOTLEY, Registrar.

**City of Dublin Hospital. — The**  
Course of Practical, Medical, and Surgical Instruction in this Hospital  
will commence on the 2nd of October, 1854.

The Clinical Lectures will be delivered on three days in each week, during  
the Session, by Dr. Jacob, Dr. Benson, Mr. Hargrave, Mr. Williams, Dr.  
Geoghegan, and Mr. Tufnell; and on Diseases peculiar to Women and  
Children by Dr. Beatty.

Dr. Jacob's Clinical Lectures on Diseases of the Eye, illustrated by the  
Cases in the Hospital, are open to the Pupils in attendance.

Sir Henry Marsh, Sir Philip Crampton, Mr. Cusack, and Dr. Apjohn, give  
their assistance in cases requiring consultation.

The certificates of attendance are received as qualification by all the Colleges,  
Halls, and Boards.

**Diseases of the Eye.—Dr. Jacob will**

deliver a full Course of Lectures on the Anatomy, Physiology, and  
Optical Mechanism of the Eye, during the ensuing Session, in the College of  
Surgeons; and also a Separate Course on its Pathology and Diseases, with the  
Operations required in their Treatment, in the City of Dublin Hospital.

**Madeira. — The Rev. Alex. J. D.**

DORSEY intends returning to the Island, via Liverpool, on the 24th  
inst., and will take charge of PUPILS. Terms for Education, £20; for Board,  
£30 to £70; Passage out and home, £15. Address, till 22nd inst., 97, Douglas-  
street, Glasgow.

Clinical Medicine and Clinical Surgery, at the Northern and South Infirmary, by the Physicians and Surgeons of these Institutions. Clinical Midwifery, at the Lying-in Hospital.

The Medical Session will be opened on Monday, 30th October, 1854, at Two o'clock, by an Address from the Dean, and on the following day the Courses of Lectures will commence as under:—

ANATOMY AND PHYSIOLOGY—Tuesday, 31st October, at One o'clock, to be continued daily, except on Saturdays, at the same hour.

THE PRACTICAL ANATOMY will be conducted by the Professor of Anatomy and Physiology and a Demonstrator. The Course will be opened for Dissections on the 17th October, and the DEMONSTRATIONS will commence on Thursday, 2nd November, and be continued daily at Twelve o'clock, except Saturdays.

MATERIA MEDICA—Thursday, 2nd November, at Two o'clock, to be continued on Tuesdays, Thursdays, and Fridays, at the same hour.

PRACTICE OF MEDICINE—Thursday, 2nd November, at Three o'clock, to be continued on Tuesdays and Thursdays, at the same hour, and on Saturdays, at One o'clock.

PRACTICE OF SURGERY—Wednesday, 1st November, at Three o'clock, to be continued on Mondays, Wednesdays, and Fridays, at the same hour.

Eight Scholarships will be awarded to Students in Medicine, thus—Six Junior Scholarships of £20 each to Students commencing their first, second, and third year, two to each year; and two Senior Scholarships of £40 each to Students commencing their fourth year.

Those Fees hitherto payable by Matriculated Students on behalf of the College for incidental expenses being now, in part, provided for by public grants, shall henceforth be reduced for each Student from £3 to 10s. for Matriculation and first year, and from £2 to 5s. for the second and subsequent years.

By order of the President,

ROBERT JOHN KENNY, Registrar.

Queen's College, Cork, September 6th, 1854.

## Medical Benevolent College.

President—The Right Honourable the Earl Manserv.

Trustees—Dr. J. Wilson; Dr. R. Lee, F.R.S.; William Ferguson, Esq., F.R.S.; John Baccot, Esq.; Benjamin Phillips, Esq., F.R.S.

Treasurer—John Propert, Esq., 6, New Cavendish-street.

The Council of the Medical Benevolent College gratefully acknowledge the warm and extensive support which this much-needed Institution has met with, and continues to enjoy, at the hands of the Members of the Medical Profession and of the Public at large. They have a pride and a pleasure in again availing themselves of an opportunity of recording their especial thanks to the Honorary Local Secretaries, to whose energy and zeal in the cause so much of its success has been due. The portion of the Building contracted for will now shortly be roofed in, and will therefore at an early period be ready for the reception of inmates. But the numerous applications that are constantly being made for admission prove most palpably that the accommodation will be far beneath the requirements of the case. The Council beg to remind their friends, that owing to the extraordinary high price of building materials, as well as of labour, they were, at the time of entering into the contract, reluctantly compelled to limit the accommodation for Pensioners much more than was originally intended, and they are of opinion that greater provision is imperatively demanded. In reliance upon the merits of their cause, which is truly one of the whole Medical Profession, and of all who have ever derived benefit from its Members—in full confidence and faith that the work, so well begun, will with its growth take a firmer hold in the affections, and receive a proportionately increasing support from their countrymen, the Council have boldly resolved to build additional Residences, by means of which it will be possible to receive, in the course of the ensuing year, a fair proportion of the deserving Applicants as Pensioners. The Council trust that those who enjoy affluence will not withhold their contributions; that those who cannot spare from their own incomes will use their influence with their friends; and that all will contribute as much as in them lies, by word or deed, to realize in full a plan which will redound to the credit and honour of all engaged in the enterprise.

By order of the Council,

EDWARD HENRY SLEVEKING, M.D., Hon. Sec.

HERBERT WILLIAMS, Assistant Sec.

Office, 37, Soho-square, Sept. 13th, 1854.

DONORS OF TEN GUINEAS are Life Governors of the College; Subscribers of ONE GUINEA Annually are Governors during the continuance of their Subscription.

Any information with regard to the details of the Institution will gladly be communicated by parties addressing inquiries to the Secretary, at the Offices of the College, 37, Soho-square, by whom, as well as by Members of the Council, and by the Honorary Local Secretaries, Subscriptions and Donations will be thankfully received; and also by the Treasurer and the following Bankers:—Goslings and Sharpe, 19, Fleet-street; Combs and Co., 59, Strand; Drummonds, Charing-cross; Glynn and Co., 67, Lombard-street; Scott and Co., 1, Cavendish-square; Hoare and Co., Fleet-street; the Union Bank of London, Regent-street Branch; Williams, Deacon, Labouchere, and Co., Birchin-lane; and by Cundliffe and Co., Manchester.

## Dr. Barron will resume his Medical

and SURGICAL TUITION, adapted to Gentlemen preparing for Professional Examinations, on September 26th.

The regular WINTER COURSE will commence on October 3rd.  
 15, St. Thomas'-street, Borough.

## Mr. Power and Dr. Power continue,

daily, their LECTURES and EXAMINATIONS, preparatory for the Colleges of Physicians and Surgeons, the Scotch Universities, the Apothecaries' Hall, and the Army, Navy, and East India Boards.

Mr. Power resides, privately, at his own residence, Practitioners preparing for the Degree of M.D. or College of Physicians; he also prepares by correspondence. Dr. Power receives two House Pupils.

Lecture-room, Exeter-hall, Strand.

## Private Medical Tuition.—

A Physician of a practical and scientific reputation, residing near Russell-square, receives HOUSE-PUPILS, as well as others, whose Medical Education, in all its branches, will be carefully and privately instructed by teachers of great experience and acknowledged ability. As a private Medical School, this establishment offers unequalled facilities for enabling Medical Students to undergo the requisite Medical, Surgical, and Chemical Examinations at the different Boards. The Students may be instructed singly or in classes, as they may prefer.—Apply to THE LANCET Office.

N.B. A Chemical Laboratory on the Premises.

TO ALL BAD WRITERS.

## Mr. T. H. Carstairs continues to give

LESSONS to Ladies and Gentlemen in his IMPROVED METHOD of WRITING, which enables those who take advantage of it to acquire as great a degree of freedom and facility as can be desired.

Prospectuses of Terms, &amp;c., may be had at 81, Lombard-street, City.

## Cheltenham General Hospital and

DISPENSARY.—Wanted, a DISPENSER for this Institution, who will be required to take the whole charge of the Dispensing Department, to perform the minor Operations of Surgery, and act in every respect as Assistant Surgeon. No person under thirty years of age will be appointed. Salary £30 per annum, (with an increase if the officer is approved of,) with board and lodging in the Hospital.—Immediate applications, with testimonials, to be sent to David Hartley, Resident Surgeon.

September 12th, 1854.

TO THE MEDICAL PROFESSION.

## A Vacancy for a Surgeon having

occurred in the Honorary Medical Staff of the Farringdon General Dispensary and Lying-in Charity, the Committee of Management will meet at the Institution, 17, Bartlett's-buildings, Holborn, on Tuesday, the 26th of September, at Seven o'clock in the Evening, to fill up such Vacancy. Gentlemen willing to become Candidates (must be Members of the Royal College of Surgeons of England, and not practise Midwifery or Pharmacy) are requested to forward their testimonials to the Secretary, on or before the 25th of September.

St. Sepulchre's Church Porch, Snowhill.

S. J. JONES, Hon. Sec.

## Leeds Public Dispensary.—

Mr. SIMPSON having resigned his Office of APOTHECARY to this Institution, the Medical Officers will elect his Successor on Monday, Oct. 9th. No one will be eligible for the appointment who is not a Licentiate of the Apothecaries' Company. Salary £120 per annum, with a furnished house, coals, and candles.

By direction of the Committee, a preference will be given to a married man whose wife would be willing to take the general management of the house; or to an unmarried man having an elderly relative who would undertake the same duties.

Candidates for the Situation are required to present themselves, with their testimonials, at the Dispensary, on Thursday, October 5th, at Twelve o'clock; and the Medical Officers will proceed to the Election on the Monday following.

Further information may be obtained on application to Mr. C. G. Wheelhouse, Surgeon, 16, East Parade, Leeds.

Leeds, September 28th, 1854.

TWO RESIDENT ASSISTANT APOTHECARIES are also wanted for this Institution, who will have permission to attend a limited number of Lectures at the Leeds School of Medicine.—Testimonials to be forwarded as above.

TO THE MEDICAL PROFESSION.

## Dorset County Lunatic Asylum,

Forston, near Dorchester.—A Vacancy having occurred in the office of RESIDENT MEDICAL OFFICER of the Dorset County Lunatic Asylum, in consequence of the death of Mr. Sandon, the late Medical Superintendent, Gentlemen desirous of becoming Candidates for the Appointment, must be Members of the Royal College of Surgeons, London, and also Licentiates of the Apothecaries' Company, or Members of the Royal College of Physicians, London or Edinburgh; must have had experience in the treatment of the Insane, and the management of a Lunatic Asylum, and must not be under thirty years of age. The Salary will be £200 per annum, with Board and Residence at the Asylum.

Candidates are requested to send their Testimonials (stating age) addressed to the Committee of Visitors of the Forston Lunatic Asylum, on or before the 15th September next, under cover to Mr. John Brown, Dorchester, Clerk to the Visitors, from whom further information may be obtained. Due notice of the day and hour of Election will afterwards be given to such of the Candidates as the Committee may select for choice, and they will be informed whether their personal attendance will then be required.

Dated the 29th August, 1854.

## Sp. Vin. Rect.—Reduction in Price!

For CASH on delivery, our price for this fine Spirit, fully 66° overproof, is now 17s. per Gallon.

HENRY BRETT and Co., Old Fumival's Distillery, Holborn.

14th September, 1854.

## Dr. Ure and Dr. Letheby, having

analyzed our EAU DE VIE, concur in pronouncing it "a Spirit of un doubted purity, applicable to every purpose for which Brandy is required," and in several respects preferable to COGNAC. Imperial Gallon, 16s. A Case containing a Dozen French Bottles, with French labels, 35s. Cash.

HENRY BRETT & CO., Old Fumival's Distillery, Holborn.

## Brett's Ginger Brandy, for Diarrhoea.

A powerful astringent, carminative, and delicious Liqueur. Imperial Gallon, 18s. In Pint and Quart Wine-bottles, 20s. and 33s., by the Dozen. Beware of deleterious counterfeits.

HENRY BRETT & CO., Old Fumival's Distillery, Holborn.

## Pale India Ale and Stout, 4s. 6d.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.

WOOD & WATSON, 16, Clement's-lane, City.

## Allsopp's Pale Ale.—Medical gentle-

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either case or bottle, by addressing their orders to NATHANIEL EASTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hoffmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTY, 132, Upper Thames-street, London.

## Soyer's Aromatic Mustard.—"M.

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

## To Invalids and those desirous of

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMOEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

## Cocoa of the finest quality, prepared

in the best possible manner.—Our PURE GRANULATED COCOA was pronounced by the Analytical Chemists employed by THE LANCET in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 8d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s., for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

## DOMESTIC ECONOMY

## H. Sparrow and Co. beg to announce

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Souchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

## Do you bruise your Oats yet?—New

Oat-crushers, £2 15s., £4 6s.; Chaff-cutters, £1 7s., £3 7s.; Mangles, £2 10s.; Flour-mills, £4 10s.—WEDLAKE and Co., 118, Fenchurch-street.—One bushel when crushed makes two.

How to Keep a Horse for 9s. a Week; or a Book on Feeding, 1s. 4d.

TO THE PROFESSION.

## Mr. Bowmer, M.R.C.S. Eng., 50,

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

## Notice to the Students of St. Bartho-

LOMEW'S HOSPITAL.—A Medical Man, living within ten minutes' walk of the above Hospital, offers comfortable APARTMENTS, with entire or partial Board, to a respectable young man, on moderate terms. No other lodgers, or children.—Apply at T. Jones', Medical Bookseller, 91, Aldersgate-street.

## Assistant.—A Second-year's Student

at one of the Borough Hospitals, is desirous of obtaining a SITUATION with a Medical Practitioner, who would consider his services an equivalent for board, lodging, and permission to attend Lectures and Hospital Practice.—Address, A. B. C., 66, St. George's-road, New Kent-road, London.

## An experienced Teacher, Lecturer

at a Metropolitan School of Medicine, and Graduate in high honours of the University of London, can receive a STUDENT, of gentlemanly habits, to reside with him during the ensuing Medical Session. In addition to a comfortable home, he will have free admission to some of the necessary courses of Lectures, and when sufficiently advanced, will be provided with Cases.—Address, B. M. D., University College, Gower-street, London.

## Wanted for a Mission Station in

the Falkland Islands, a Surgeon, of truly religious principles and habits, to act as General Superintendent of the concerns and persons of the Mission. He must be a man ready to endure hardness, and willing to spend and be spent for Christ's sake.—Applications for further particulars to be made of the Rev. G. P. Despard, Hon. Sec., Ridgway House, Stapleton-road, Bristol.

TO CHEMISTS AND DRUGGISTS.

## To Let, in an excellent situation, a

HOUSE and SHOP in the above line, now shut up.—Apply to Mr. Clant, 7, Studley-villas, Studley-road, Stockwell, where all particulars can be had.

## To Let, in a first-rate neighbourhood

for a Chemist and Druggist, at the West-end, a double-fronted CORNER SHOP, plate-glass front, and fitted with every domestic convenience. Rent £50 for first year. Also, a semi-detached Villa Residence, with large garden, &c., pleasantly situated, and with commanding sea view, in Dorsetshire. Rent £32 per annum.—Apply to S. J. Cross, 11, Featherstone-street, Finsbury.

TO MEDICAL STUDENTS AND OTHERS.

## Apartment furnished, with attend-

ance, in the house of a professional gentleman, in a central and agreeable part of London, close to the British Museum, and less than half-a-mile from the Middlesex, University College, Charing-cross, and King's College Hospitals. Terms average £1 per floor weekly; single rooms, 10s.—Address, 13, Caroline-street, Bedford-square.

## Clerical, Scholastic, and Governess

AGENCY OFFICES, (late Valpy, Established 1833,) 7, TAVISTOCK-ROW, COVENT-GARDEN, LONDON. The gentry and families requiring Tutors, Governesses, or Companions, for either residence, travelling, or daily attendance, on making known their requirements to Messrs. MAIR and SON, will at once be introduced FREE OF CHARGE to qualified and experienced applicants with good testimonials. Schools recommended, and Ecclesiastical and School property transferred. A prospectus forwarded on application.

## Halifax Infirmary and Dispensary.

Wanted, a RESIDENT MEDICAL OFFICER to the above Institution, who is required to be a Licentiate of the Society of Apothecaries. The salary is £80 per annum, with Board and Lodging, and a Compounder is provided. The appointment is vested in the Medical Staff, and will take place on Wednesday, the 27th of September next. Testimonials to be sent in by Saturday, the 23rd of September, addressed to the House-Surgeon, Infirmary, Halifax.

Halifax, August 23rd, 1854.

TO MEDICAL MEN OF CAPITAL.

## The Inventor and Patentee of a

new but not secret Medical Remedy, the very superior merits of which may be easily and at once ascertained, is desirous of meeting with a Medical Gentleman who would take a share in the Invention, with a view to promote its speedy and general introduction into the Hospitals and among professional men. The sale augurs exceedingly well already, and, with the assistance looked for, it must in less than a year become all but unlimited. Capital wanted, £1000, for which either a share in the Patent for fourteen years and in the profits, or, if so preferred, ample security in goods, &c., and a good percentage, would be given, besides a bonus on the profits, which are very considerable. First-class references given and required.—Apply to A. O., at Mr. Taylor's, 33, Great Castle-street, Regent-street.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS,

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.  
Office hours from 12 till 4.

**A Gentleman, who has matriculated**

at the London University and Apothecaries' Hall, wishes to assist a Practitioner during the hours not required for his hospital studies, in consideration of board and lodging.—Apply to Mr. Monson Hills, Gay's Hospital

**Wanted by a General Practitioner,**

an ASSISTANT to Dispense, occasionally Visit and attend Midwifery.—Apply, by letter, to M.D., THE LANCET Office, 423, Strand, stating age and salary required.

**A Small Practice in a rich and agri-**

cultural district, may be had on very reasonable terms. There is a comfortable House and some Land attached.—Apply by letter to A. B., care of Messrs. Hodgkinson and Tonge, 213, Upper Thames-street, London.

**Wanted, by a respectable Young**

Man, twenty-six years of age, qualified to attend Midwifery, a Situation as Visiting and Dispensing ASSISTANT to a Medical Man.—Address, Celsus, Mr. Fawcett's, Stationer, Sleaford, Lincolnshire.

**An M.R.C.S. and L.S.A., with first-**

class Testimonials, wishes to enter into PARTNERSHIP with a Gentleman in good Practice.—Address, A. Z., Library, St. Thomas's Hospital.

of, in Gloucestershire, for £200, including Surgery, Fixtures, Drugs, &c.; capable of being increased by an active duly-qualified person.—For particulars address, post-paid, to H. B., 63, Kennington-lane, London.

**A quick and neat Dispenser would**

like to find Employment with a Surgeon for two or three hours in the day or evening.—Apply, by letter, to A. V., 30, St. Martin's-street, Leicester-square.

**A Medical Student, pursuing Hos-**

pital Studies in London, can have Board and Lodging in the house of a Surgeon in the City, who will employ his spare hours at a liberal salary. References required.—Address, X. Y. Z., Mr. Board, 24, Cannon-street West, London.

**A rare opportunity offers to a young**

enterprising Medical Man, who can command a small Capital, to join the Advertiser in a first-class undertaking, without any risk or responsibility.—Address, stating position, &c., M. A., 11, Newham-street, Edgware-road, London.

MEDICAL.

**Wanted, by a Gentleman of some**

experience, a SITUATION in the country. Fully accustomed to the routine of Dispensing, Visiting, and attending Midwifery.—Address, Alpha, 4, Smith-street, Chelsea.

**Wanted, at an Iron Works, an Un-**

qualified ASSISTANT, who can Dispense and attend Midwifery; he will have every opportunity of thoroughly acquiring his Profession. Salary £25 per annum, with Board and Lodging.—Address, W. F. T., Clydach, Abergavenny.

MEDICAL.

**A Senior Assistant is required by a**

General Practitioner in town. He must be a qualified Surgeon, and willing to assist in Dispensing.—Apply, personally, to N. M., 50, Parliament-street, before Twelve in the morning.

**Wanted immediately, an In-door**

Visiting and Dispensing ASSISTANT, competent to attend Midwifery, between twenty-six and thirty years of age, of active habits and unexceptionable character.—Apply, personally, to Mr. Josh. Dakin, Chemist, High-street, Poplar.

**Wanted, by a Gentleman who has**

seen extensive Country Practice, the Situation of Visiting ASSISTANT. Board and lodging, with time to attend Hospital Studies, to be considered equivalent to his services.—Apply by letter, post-paid, to E. H., at E. Ray's, Esq., Milton, next Sittingbourn.

TO MEDICAL PRACTITIONERS.

**A Gentleman, aged 33, is in imme-**

diately want of a Re-engagement as MEDICAL DISPENSER, and also, from long experience, is capable of keeping Surgical Accounts. Unexceptionable references given by his last employer.—Address, X. Y., Post-Office, Lichfield.

Medical Transfer and Partnership.

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RESIGN, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

MEDICAL.

**The commodious House recently**

occupied by the late Dr. Turle, (and formerly by Mr. Henderson,) at River-terrace, Islington, is now to LET on Lease, at a moderate rental, and from its position and arrangements, peculiarly calculated for the residence of a medical practitioner.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

MEDICAL.

**A capital Dwelling-house and Pre-**

miere, near Portland-place, fitted for a Physician or first-class Practitioner, are to be SOLD or LET on moderate terms.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

MEDICAL.

**Five Hundred Pounds per annum.**

A highly respectable CONNEXION, (without Appointments,) in a beautiful part of England, is Transferable, and peculiarly suited for a Gentleman wishing a select Connexion, at a moderate rate of purchase. The residence has excellent grounds attached, and possesses every convenience.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

**Insanity and Nervousness.—In a**

small Establishment, conducted by a Lady, two or three PATIENTS can be RECEIVED on very moderate terms. Every possible care, attention, and kindness, is observed, and the fullest confidence may be placed in the advertiser. References of the first respectability will be offered.—Apply by letter, or personally, to Miss Lush, York House, Battersea, Surrey.

MEDICAL.

**For Disposal, a well-established**

GENERAL PRACTICE, in a small railway town situate in the south of Yorkshire. Such an opportunity seldom offers for the safe transfer of £350 to £400 per annum.—Address, A. Z., Messrs. Butterfield and Clark, Wholesale Druggists, York.

MEDICAL.

**A Gentleman, married, is open to an**

Engagement as Out-door Visiting ASSISTANT to a Surgeon in the country; has taken his Degree, and can give high Testimonials. No objection to take the entire charge of a Gentleman's Practice, or a Situation with a future view to Partnership.—Address, W. S., Post-office, Stepney-gate, Commercial-road East, London.

MEDICAL.

**Wanted, by a Gentleman, a Situa-**

tion as a DISPENSER in a Private Surgery near the London Hospital. Time for attendance on the necessary lectures and a comfortable home, &c., would be considered equivalent to salary. The most satisfactory reference can be given. Capable of visiting and attending midwifery, if necessary.—Address, P., T. C. Miller, Esq., Surgeon, Redworth, Warwickshire.

**A Medical Gentleman, in extensive**

Practice, residing in Finsbury-square, connected with one of the Public Institutions, who assists Gentlemen to pass the Hall and Colleges, &c. &c., has a Vacancy for a PUPIL, or could accommodate two Gentlemen with Board, or partial Board and Lodging, on reasonable terms. References can be given.—Address, C. B., at Alabaster and Passmore's, 34, Wilson-street, Finsbury-square.

**Wanted, by a Gentleman, M.R.C.S.**

Eng. and L.A.C., aged twenty-five, who has been two years House-Surgeon to a large Hospital, and is well acquainted with Union and General Practice, a Situation as In or Out-door ASSISTANT to an elderly Practitioner. A liberal salary required. For testimonials and references, address, Omicron, Post-office, Lutterworth, Leicestershire.

**A Surgeon, in the country, wishes to**

place his Son, aged eighteen, (who has been in his father's Surgery three years,) with some respectable Surgeon, either in London, Manchester, Liverpool, Leeds, or Hull, for Three Years, where he may be allowed to attend Lectures and Hospital Practice, with Board and Lodging for his Services.—Apply to Messrs. Preston and Sons, Wholesale Druggists, 94, Smithfield-bars, London.

TO MEDICAL AND OTHER STUDENTS.

**A Surgeon having a larger House**

than he requires, can accommodate Three or Four Gentlemen with Bed-rooms and Breakfast, and additional Board if required, at moderate terms. Central for University, Middlesex, King's College, the Royal Free, or St. Bartholomew Hospitals.—Address, M.R.C.S., 18, Hunter-street, Brunswick-square.

*Just Published, thick 8vo, cloth, 21s.*

# THE PRINCIPLES AND PRACTICE OF SURGERY,

*Illustrated by numerous Engravings on Wood.*

By WILLIAM PIRRIE, F.R.S.E.,

REGIUS PROFESSOR OF SURGERY IN THE MARISCHAL COLLEGE AND UNIVERSITY OF ABERDEEN; SURGEON TO THE ROYAL INFIRMARY, ETC.

## OPINIONS OF THE BRITISH PRESS.

"Professor Pirrie has produced a work which is equally deserving of praise as an admirable text-book for surgical pupils, and as a book of reference for experienced practitioners. We rejoice to find that the chair of Surgery is so ably filled in Aberdeen. . . . Professor Pirrie's work is clear and trustworthy. All recent improvements, real or pretended, are judiciously and candidly discussed."—*LONDON JOURNAL OF MEDICINE.*

"This work deserves to be made generally known, in consequence of its remarkable merits as a treatise on the Principles and Practice of Surgery. It is due to the author to say that he has been at great pains to place before the reader faithful descriptions of surgical diseases and injuries, and to explain, upon the most approved principles, the treatment required by each. The accounts of the several operations are given with clearness and ability. The work is highly creditable to the knowledge of the author, and cannot fail to be a most serviceable guide to the student and practitioner of surgery."—*EDINBURGH MEDICAL AND SURGICAL JOURNAL.*

"Any attempt to analyze such a work would be tantamount to the criticism of modern surgical literature. Dr. Pirrie seems to us to have executed his task with diligence, fairness, and success. He has collected a large amount of information, arranged it in a convenient form, and expressed it in distinct language. Through the assistance of an active London publisher, he has produced a very handsome book, with all the advantages of good paper and typography, and ornamented with many woodcuts, some of which are from

the blocks belonging to a work remarkable for its excellence in this department. On the whole, we think Dr. Pirrie's work creditable to the school with which he is connected, and likely to be useful, not only there, but wherever a careful digest of surgical knowledge is required."—*EDINBURGH MONTHLY JOURNAL OF MEDICAL SCIENCE.*

"The author has performed his task well and creditably. He has presented a text-book on surgery which will be acceptable, not only to his own pupils, past and present, but useful in the hands of all who affect the literature, as well as the practice, of surgery. . . . Throughout the whole there are a clearness and modesty of style which do the author much credit. The value of the work is enhanced by its numerous woodcuts."—*MEDICAL TIMES AND GAZETTE.*

"We have much pleasure in giving it as our deliberate opinion, that by far the greater part of the work is most carefully, judiciously, and ably written; and Mr. Pirrie has, for the most part, fully succeeded in his 'endeavour to combine simplicity of arrangement and conciseness and clearness of description, with the elucidation of sound principles and practice.' It is extremely difficult to convey an adequate idea of the merits of an elementary work, when those merits consist in method, condensation, and perspicuity. By far the greater part of Mr. Pirrie's book possess these in a very high degree."—*BRITISH AND FOREIGN MEDICO-CHIRURGICAL REVIEW.*

## OPINIONS OF THE AMERICAN PRESS.

"We have already remarked on the abundant evidences we have, in every page of this work, of the rich stores of materials which the author possesses, and we would here add our testimony in favour of the felicitous style in which he delineates his views. His pathological descriptions are peculiarly clear. Evidently familiar with the appearances of the parts he wishes to describe, and gifted with a freedom and precision of language which, unfortunately, are not characteristics of all those who have grappled with the same subjects, he makes the most difficult descriptions as clear as the simplest anatomical delineations. It is a really well-written book, and an extremely valuable contribution to surgical literature."—*THE CHARLESTON MEDICAL JOURNAL AND REVIEW.*

"This work, although just introduced to the notice of the profession, has already acquired a high reputation for the fulness of its details, and the soundness of its precepts; and has been introduced as a text-book in many of the Medical Colleges. However well it may be adapted for a text-book (and in this respect it may compete with the best of them), of this much our reading has convinced us, that as a systematic treatise, it is carefully and ably written, and can hardly fail to command a prominent position in the library of practitioners. It furnishes the student and practitioner with as chaste and concise a work as exists in our language."—*NEW YORK JOURNAL OF MEDICINE.*

"We know of no other surgical book of a reasonable size, wherein there is so much theory and practice, or where subjects are more soundly or clearly taught."—*THE STETHOSCOPE.*

"There is scarcely a disease of bone or soft parts, fracture or dislocation, that is not illustrated by accurate wood engravings. Then again, every instrument employed by surgeons is thus represented. These engravings are not only correct, but really beautiful, showing the astonishing degree of perfection to which the art of wood engraving has arrived. Professor Pirrie, in the work before us, has elaborately discussed the principles of Surgery, and a safe and effectual practice predicated upon them. Perhaps no work upon this subject heretofore issued is so full upon the science of the art of surgery."—*NASHVILLE JOURNAL OF MEDICINE AND SURGERY.*

"We have made ourselves more intimately acquainted with its details, and can now pronounce it to be one of the best treatises on surgery in the English language."—*CANADA MEDICAL JOURNAL.*

"Our impression is, that, as a manual for students, Pirrie's is the best work extant."—*WESTERN MEDICAL AND SURGICAL JOURNAL.*

"The favour with which it has been greeted on both sides of the Atlantic, will more than justify the author's venture and its immediate re-issue in this country. There is so little to object to in the doctrine and arrangement of the work, and so much to approve in it as a lucid elementary exposition of the present state of the principles and practice of surgery, and as a safe and

attractive guide to the student of this branch, that we do not hesitate to recommend it warmly to our readers as already the best of its kind yet published."—*THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES.*

"The author has succeeded in combining simplicity of arrangement, conciseness, and clearness of expression, with the elucidation of sound principles and practice. We are of opinion that this will make an excellent standard work, and well adapted for reference for the general practitioner."—*OHIO MEDICAL AND SURGICAL JOURNAL.*

"We have no doubt that it is destined to become, in a very short time, one of the most popular text-books on surgery now extant. In a word, it strikes us as being precisely the work wanted by students on this subject. We could easily have filled our journal with extracts from its pages, which our readers would peruse with interest, but the space at our command is exhausted, and we dismiss it with the assurance that they cannot purchase a more valuable work on surgery."—*THE WESTERN JOURNAL OF MEDICINE AND SURGERY.*

"The cursory examination which we have been able to give this new work has impressed us very strongly in its favour. The author is well known as an experienced teacher in this department, and his admirable opportunities and experience have enabled him to render his book highly practicable, and adapt it to the use of students as a text-book. The woodcuts are admirable, and the typography worthy of the publishers."—*NEW YORK MEDICAL GAZETTE.*

"After a patient and careful examination, we are constrained to say that there is no better practical guide to every-day practical surgery than this."—*BOSTON MEDICAL SURGERY JOURNAL.*

"Professor Pirrie shows by the work before us that he is an able teacher and can make a good book for the use of students and general practitioners. We predict for Pirrie's Surgery an extensive sale to students."—*SOUTHERN MEDICAL AND SURGICAL JOURNAL.*

"The work before us we believe fully equal, as a text-book, to any of them. The author is practical, concise, and systematic; and, what is still better, he is entirely familiar with modern science. The work is elegantly and appropriately illustrated with woodcuts; indeed, we have seen nothing superior in any surgical book published in this country. We incline to think that Pirrie's Surgery will prove more popular than most of the European works re-published in the United States."—*THE WESTERN LANCET.*

This work of Professor Pirrie is so admirable a summary of this branch of medical science, and so well adapted to the wants of students, that we comprehend the motive of the publishers in giving us the American reprint. It is more complete than such works usually are, and conveys its rules and maxims in simple, perspicuous, and appropriate language."—*NEW ORLEANS MEDICAL REGISTER.*

LONDON: JOHN CHURCHILL, NEW BURLINGTON-STREET.

PRINTED by THOMAS CHOATE SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CHURCHILL, of No. 423, Strand, in the parish of St. Martin-in-the-Fields, Westminster, in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—Saturday, September 16, 1854.

## THE BRITISH MEDICAL DIRECTORY FOR 1855.

The Editors respectfully and gratefully acknowledge the receipt of a large number of "Returns" for this Directory.

The Editors have stated on previous occasions, that when the entries in the Directory for the current year (1854) are found to be correct, a mere intimation of that fact will be sufficient; but when *alterations* are required, they should be distinctly specified, and in all cases the Names should be written *clearly*, and at *full length*.

Lists of the Names of duly-qualified Practitioners resident in the several Cities, Towns, and Villages of the United Kingdom, will be thankfully received, as also information of the Death, Removal, or Appointment to a Public Office, of any duly-qualified Practitioner. In the Metropolis, and other Cities and large Towns, the *streets* and *numbers* of the Houses should be given.

Forms of Returns are again issued with every number of the current impression of THE LANCET.

Duly-qualified Practitioners who have already responded to these appeals would confer a favour on the Editors by inducing Professional friends and neighbours to make their "Returns" as quickly as possible, as delays might evidently cause some names to be omitted.

"The BRITISH MEDICAL DIRECTORY, for ENGLAND, WALES and SCOTLAND," to be published on the 1st of January, 1855, may be obtained of all Booksellers and Newsmen, price Six Shillings, (including One Shilling postage.)

HARVEY ON THE EAR.

WOOD & WATSON, 16, Clement's-lane, City.

**Allsopp's Pale Ale.—Medical gentle-**  
men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

**To Invalids and those desirous of**  
PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO'S HOMOEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

**Cocoa of the finest quality, prepared**  
in the best possible manner.—Our PURE GRANULATED COCOA was pronounced by the Analytical Chemists employed by THE LANCET, in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 6d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s., for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

## DOMESTIC ECONOMY

**H. Sparrow and Co. beg to announce**  
that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.  
Fine Souchong, 3s. 4d., 3s. 8d., and 4s.  
Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.  
Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.  
Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

**Robinson's Patent Barley, for making**  
superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants, Children, and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS form another Diet universally esteemed for making a superior Gruel in Fifteen Minutes,—light for supper,—and alternately with the Patent Barley is an excellent Food for Children and Invalids, being particularly recommended by the Faculty as the purest and best Preparation of the kind extant, and far preferable to the Embden Groats.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets of 6d., and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

**Soyer's Aromatic Mustard.—"M."**  
Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration.—THE LANCET.  
Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

**Infants' New Feeding Bottles.—These**  
celebrated Nursing Bottles, the best Artificial Mother ever invented, enabling the most delicate infant to feed from its birth with the greatest comfort and ease, are adapted to milk, biscuits, and all kinds of food. The Nipple, of novel material, is elastic, soft, durable, very cleanly, and so beautiful an imitation of nature, that no infant ever refuses it.—BENJAMIN ELAM, 196, Oxford-street.—7s. 6d.—Each is stamped with my name and address.

GREAT REDUCTION IN PRICE OF  
**Sir William Burnett's Disinfecting**  
FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d.  
This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.  
Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street, London-bridge.—N.B. Beware of a spurious imitation.

**The Cholera Prevented by the**  
destruction of all noxious effluvia.

CREWS'S DISINFECTING FLUID. Recommended by the College of Physicians and the London Board of Health. The cheapest and strongest CHLORIDE OF ZINC.

Quarts, 2s. Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.  
Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED.  
FURTHER GREAT REDUCTION IN PRICE.

**Crews's Disinfecting Fluid is the**  
Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crews's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in Imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 5s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.  
Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.  
**Important Saving, by Pre-payment,**  
in the PURCHASE of

NEW WHITE MOULDED VIALS.  
APSELY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

---	--

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSELY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

DOUBLE PATENT.

**Briet's portable Gazogène,**  
OR SODA-WATER APPARATUS,

for the immediate production of Soda-water, Ginger-beer, sparkling Wine, Lemonade, &c. &c.

SPECIAL POWDERS for generating Gas in the same, cheaper and more effective than any other preparation.

SELTZER POWDERS, prepared from a recent analysis of the fresh water from the spring by a celebrated German chemist.

PATENT REFRIGERATOR, or Gazogène-Cooler  
PATENT PORTABLE FILTER, a cheap and useful article, not occupying more than four to six inches in space, and filtering from six to ten gallons per twenty-four hours, suitable for Military, Navy, and Travellers in all Climates.

Sole Wholesale Agents, GEBHARDT, ROTTMANN and Co., 21, Bartlett's-buildings, Holborn, London.

NOTICE is hereby given, that proceedings will be adopted against all parties selling or exposing for sale the imitations of the above-named articles, as the said imitations are infringements upon these patents.

**GOLD CHAINS AND JEWELLERY.**

**Watherston and Brogden, Wholesale Manufacturing Goldsmiths and JEWELLERS,** beg to announce to the Nobility, Gentry, and Public in general, that in obedience to the numerous calls made upon them since the Great Exhibition, where they were awarded a Prize Medal, they have resolved to throw open their Manufactory to the Public at Manufacturers' prices, a closer connexion than has hitherto existed between the real worker in the precious metals and the Public being obviously an advantage to both parties. Gold is capable of being alloyed to any extent, and therefore, in order to protect the Public in the article of Chains, Watherston and Brogden will make the Mint price of 77s. 10½d. per oz. for British standard the basis of all their operations, and, making their profit on the workmanship alone, will charge the bullion in their Chains at its intrinsic value, undertaking to re-purchase it at any time at the same price: thus—15 carat gold will be charged and will realize 53s. 1d. per oz.; 18 carat gold will be charged and will realize 63s. 8½d. per oz.; 22 carat gold will be charged the Mint price of 77s. 10½d. The price for workmanship will be charged according to the intricacy or simplicity of the pattern: for example—a Chain weighing 2 oz. of 15 carat gold is worth, at 53s. 1d. per oz., £5 6s. 2d. intrinsic value; supposing the workmanship to be £2, total £7 6s. 2d. By this arrangement the purchaser will see at a glance the proportion charged for labour compared with the bullion in a Gold Chain, and, being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of Jewellery, all made at their Manufactory, 16, HENRIETTA STREET, COVENT GARDEN. (Established 1798.)

**Cholera Prevented! Rettie's Patents.**

SELF-ACTING SEWER AND SINK TRAPS, for Streets and Kitchen Sinks, to prevent all effluvia from Drains, Cesspools, and Urinals. Damp Houses cured at Fourpence per day, giving a dry, warm temperature, for sick or invalids.

PORTABLE CHAMBER CLOSETS, free from all effluvia.  
Orders to E. M. and M. Rettie, 7, Brompton-road. (Enclose Stamp.)  
N.B.—Beware of imitations on the above Patents.

**Rice Harris and Son, Islington**

GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT, LOMBARD-STREET, LONDON.—PATENT SANITARY GAS SHADES.—These Shades, manufactured exclusively by RICE HARRIS and SON, on an entirely new principle, effectually destroy the effluvia and smoke, and diminish the heat, which has hitherto made the use of gas so objectionable in dwelling-houses and offices, where cleanliness and freedom from smell are of importance. They are simple and inexpensive, and may be had in a variety of forms adapted to the style of fittings or the taste of the purchaser, at the Works in Birmingham and London.

**Metcalfe and Co.'s New Pattern**

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfume for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 180a and 181, Oxford-street, second and third doors west from Holles-street. Metcalfe's Alkaline Tooth Powder, 2s. per box.

**Funeral Extortion avoided, by Exe-**

cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Tradesmen, and others, sending in the first instance to SHILLIBEER'S OFFICE, CITY ROAD, near Finsbury-square, or to 12 NORTH STREET, QUADRANT, BRIGHTON, instead of employing their Upholsterer, or the nearest Undertaker, who, not possessing the needful requirements, resort to the Funeral Furnishers, to hire them, and consequently inflict twofold profits. Shillibeer's Establishment combines under one charge, to any scale of pomp and humility desired.

Funerals of every class, and the most varied description of conveyances, old and new styles, and first-rate equipments, at charges so moderate as to defy competition. Catholic Fittings from Paris. No extra charge within ten miles. A Nobleman's Funeral, Thirty Guineas; Gentleman's, from Ten Guineas; Tradesman's, £8; Artisan's, £4 and upwards.

Originated in 1842.

**Patent Perambulators.**

C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by Appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.

OFFICE, 467, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guineas.

CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

**Improved Invalid Cot Carriages—**

the greatest luxury and comfort ever introduced for removing invalids, being fitted up with the patent noiseless wheels. These carriages may be engaged, on moderate terms, for any journey, upon application to H. and J. BEADING, coachbuilders, 14, Biding House-lane, Cavendish-square.—N.B. A good assortment of new and second-hand carriages for sale or hire.

**Do you bruise your Oats yet?—New**

Oat-crushers, £2 15s., £4 6s.; Chaff-cutters, £1 7s., £3 7s.; Mangles, £2 10s.; Flour-mills, £4 10s.—WEDLAKE and Co., 118, Fenchurch-street.—One bushel when crushed makes two.

How to Keep a Horse for 9s. a Week; or a Book on Feeding, 1s. 4d.

**The 16s. Trousers reduced to 14s.—**

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

**To Professional Men and others.—**

The Oxford Mixed Dockskin Trousers, price 21s. The Stratus Cloth Vest, price 10s. 6d. Stock for choice, or to measure.

S. BATTAM, Coat and Trousers Maker, 180, Tottenham-court-road, four doors south of Schoolbred and Co's.

Patterns of the material and Directions for Measuring sent free per post.

**To all who cannot get a Fit; the**

importance of which requires no elucidation to convince the most sceptical how indispensably necessary it is to health, comfort, and appearance. R. T. PIGRAM, while wishing to avoid the present system of puffing, adopts this means of making known his SELF-ACTING INDICATOR of the HUMAN FIGURE. An invention can only be estimated by its results: a trial will not only give satisfaction, but will justify in favouring R. T. P. with their recommendation.

R. T. Pigram, Tailor, 51, Lamb's Conduit-street, Foundling Hospital.

**Assistant-Surgeons.—Gentlemen**

receiving Medical Appointments in the Army, Navy, or H.R.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges at

E. PHILLIPS, 28, WHITE STREAN, LONDON.

the oftentimes undervalued Naval and Military Outfitting. Warranted in the United Kingdom. Patronized by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, on application.

**Warming and Ventilating, by Hot**

AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOLLESVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment—

Eardiston House Worcestershire, March 1st, 1854.

SIR,—I am much pleased in being able to give you a justifying account of your Calorifere. Since I burn nothing but coke in it, the change has been quite surprising. I must say, that now I have a very high opinion of your machine, and find it a great comfort in my house, the cost of warming it was one shilling per day.

To J. Bollesve, Esq.

WM. SMITH. (Sir, Baronet.)

**Purification of Linen—Prevention of**

DISEASE.—J. BOLLESVE, 55, King William-street, City, London, solicits the attention of the Nobility and Gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

69, Marylebone-lane, London, Feb. 2nd, 1854.

SIR,—I have much pleasure in informing you, that I am entirely satisfied with the performance of your No. 3 Calorifere, lately put up for warming my manufactory; it has been in operation for a month, and I believe it to be the best and most economical means of drying yet invented, and particularly suited to my business, as there is no dust arising from its use, as there is from the old stoves. The consumption of coke is about one bushel per day.

I am, Sir, yours truly,

SAMUEL HUBERT,

To J. Bollesve, Esq.

Firm of JOHN WOOLLAWS and Co., Paper-stainers.

## Water Filter for the Pocket, with

DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.

J. SOLOMON, Wholesale Optician, and Photographic Dépôt, 22, Red Lion-square.

## Teeth.—Mr. Alfred Jones, of Gros-

venor-street, has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

TO THE MEDICAL PROFESSION.

## Fr. G. Ernst, Anatomical Machinist

and MANUFACTURER of SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Ridding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam ERNST (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

## Meinig's Electro-Generator,

FOR CHOLERA.

TO THE MEDICAL PROFESSION.

Having witnessed personally the greatest benefit, in the first stages of Cholera, derived from the application of weak, continuous currents of Electricity from the spine to the abdomen, by which the warmth and action of the digestive organs is maintained, and the urinary functions stimulated; and feeling confident that in an advanced stage of the disease strong, interrupted Electric Currents passed along the cramped and paralyzed limbs, and along the spinal column, will be found of paramount efficacy in restoring normal circulation, Mr. Meinig earnestly invites the Medical Profession to test and investigate the effects of Electricity in the now prevalent epidemic; and so confident does he feel of the all but marvellous success of his Apparatus in this dreadful disease, that any medical gentleman who desires it may receive Mr. Meinig's warrant, to the effect that he will retake and repay, within one month after the purchase, any Apparatus which, after trial, it might be wished to return.

Prices of the Portable Generator: 5s., 10s., 6d., 15s., 20s., and 30s., according to power. Powerful Pocket Batteries, 23s. 103, LEADENHALL-STREET, and 213A, PICCADILLY.

## India-rubber Urinals for Male and

FEMALE RAILWAY TRAVELLERS AND INVALIDS.

No. 1.

No. 2.

URINAL FOR BED USE.  
Price 15s., 10s., and 21s.

URINAL FOR TRAVELLING.  
Price 16s. and 18s.

FEMALE URINALS FOR DAY USE.  
Price 21s. and 25s.

The above Urinals are made on the most approved principles, and are all fitted with the recently-invented valve, which will not allow any return of the water by the upper part, by being placed in any position, and from their construction prevent the objectionable smell complained of in those of other Manufacturers.

Manufactured by W. S. SPARKS, 115, New Bond-street, London.  
A liberal discount allowed to the Medical Profession.

## Mineral Waters.—W. Best begs to

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seidlitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Ems-Cologne, Arquebuzard, and Foreign Mineral Water Depot, 22, Henrietta-street, Cavendish-square.—N.B. Balls and evening parties supplied with German and Struve's Artificial Seltzer Water on advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

## Poultices superseded by the use of

MARKWICK'S PATENT SPONGIO PILINE.

As a substitute for common poultices and fomentations, the superiority of this article is unquestionable. It is strongly recommended by the most eminent of the Faculty for its cleanliness, economy, lightness, and general efficacy, and is now used in several of the hospitals. Also Markwick's Patent Piline, for Cholera Belts, Rheumatism, Chest Protectors, Respirators, Cambrago, &c.

Sold, retail, by Chemists and Druggists, and wholesale only by  
GEORGE TRIMBEY, 41, Queen-street, Cheapside.

## Hare-Lip.—Extraordinary Applica-

tion and CURE.

Communication from Mr. BROADBENT, Surgeon, Ferry Hill, Durham.

MR. BENJAMIN NICKELS,

SIR,—I wish to state concerning your Plaster to the following effect. About ten days after an operation for Hare-lip, the boy fell against a stone step and ruptured the lip. The day previously I had received your Elastic Plaster, and on being summoned to the boy, (without much hope of success,) I applied three strips of the Plaster, extending from ear to ear, bringing the ruptured edges into apposition. Seven days after, the Plaster retained the cheeks in the position I had left them on the day of application. Fresh strips were then applied, and the edges ultimately united. In my opinion, no other plaster could have answered the intention, and I think it specially adapted to wounds on the face.

I remain yours obediently.

(Signed) G. W. BROADBENT.

NICKELS'S PATENT ELASTIC ADHESIVE PLASTER, and ELASTIC ADHESIVE BANDAGES, which are made on quite a new principle, rendering them a cheap, efficient, unvarying support as a spiral covering or stocking (without the trouble of lacing), for varicose veins, sprains, weak joints, and all rheumatic affections. These Bandages may also be cut and applied as ordinary strapping.

The Patentee has had the honour of receiving the highest testimonials in approbation of his ELASTIC PLASTERS from the following most eminent Members of the Profession, and many other Gentlemen, by whom they are patronised and used in their hospital and private practice:—J. C. W. LARSEN, M.D., Physician Accoucheur, Guy's Hospital. Mr. FARRAGUT, Surgeon to his Royal Highness Prince Albert, Prof. Surgeon, King's College, London; Surgeon King's College Hospital. Mr. HUXON, Surgeon, Guy's Hospital, Surgeon to the City of London Hospital for Diseases of the Chest.

THE PATENT ELASTIC OUNET PLASTERS are found most superior both in appearance and quality.

Sold by all principal Chemists in the United Kingdom, and by Mr. BENJAMIN NICKELS, Surgical Plaster Manufacturer, 9, Camberwell-green, London.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lyttæ P.L., easily applied and removed, and will not produce strangury or troublesome after-sore. It has received the sanction and commendation of many of the most eminent practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1853.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction."

60, Grosvenor-street, London.

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. BROWN'S BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Strangury.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. BROWN, Druggist, Handsworth, Birmingham."  
Prepared by Thomas B. Brown, Pharmaceutical Chemist, 42, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignees, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

## Engineers' Masonic and Universal

MUTUAL LIFE ASSURANCE SOCIETY, 345, Strand, London.

## New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES—440, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.

CAPITAL, £100,000.

TRUSTEES.

SIR JAMES DUKE, Bart., Ald., M.P.  
WILLIAM FERGUSSON, Esq., F.R.S.  
SIR CHARLES HASTINGS, M.D., D.C.L.  
GEORGE JAMES GUTHRIE, Esq., F.R.S.

DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.  
GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

The progress of the Company, from its commencement to the end of the year 1853, is shown at a glance in the subjoined Table:—

	Number of Policies issued.	Sums Assured.	Annual Premiums.
1851	301	£ 98,500	£ 3,439 0 1
1852	677	278,855	10,808 12 2
1853	1025	413,785	15,836 3 6

### MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DULY-QUALIFIED MEDICAL PRACTITIONERS AS THE MEDICAL ADVISERS OF THE COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.

MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. ON ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES EFFECTED THROUGH THEIR INTRODUCTION.

EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and influential AGENTS wanted.

CAPITAL.—ONE MILLION STERLING.

THE WHOLE PAID UP AND INVESTED FOR HALF A CENTURY.

Globe Insurance,  
CORNHILL AND PALL MALL, LONDON.

ESTABLISHED 1803.

FIRE: LIFE: ANNUITIES: REVERSIONS.

JAMES W. FRESHFIELD, Esq., M.P., F.R.S., Chairman.

FOWLER NEWSAM, Esq., Deputy-Chairman.

GEORGE CARR GLYN, Esq., M.P., Treasurer.

The NEW TABLES adopted by the GLOBE include two Scales of Life Premiums, *Participating* and *Non-Participating*, combining, with moderate rates, those principles of solidity and security which have distinguished this Company from its formation.

Two-thirds of profits apportioned as Bonus.  
One-third of the Premium may remain *Unpaid* as a debt upon the Policy.

Facilities afforded to Insurers.  
Insurances to the extent of TEN THOUSAND POUNDS on a single approved Life.

Every class of FIRE and LIFE Insurance business transacted.  
Prospectuses, with full Tables and Details, and Forms, may be had at the Company's Offices, or of the Agents.

WILLIAM NEWMARCH,  
Secretary.

## Dinneford's Pure Fluid Magnesia,

now greatly improved in purity and condensation.

"Mr. Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—PHARMACEUTICAL JOURNAL, May, 1846.

This excellent remedy, in addition to its extensive and increasing sale amongst the public, is now very largely employed in DISPENSING; for which the cheapest and most convenient form is in the STONE JARS; half-gallon, 5s. 6d.; gallon, 9s. 6d.; specially adapted for the use of Surgeons and Chemists. To be had from the manufacturers, DINNEFORD & CO., Chemists, 172, Bond-street, London; and all respectable Wholesale Druggists and Patent Medicine Houses.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1864.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.  
Impassioned Juice. Dose, half a drachm to a drachm; 16s. per lb.  
Solid Extract. Dose, five to fifteen grains; 20s. per lb.  
Taraxacum (Davenport's) Liqueur, or Fluid Extract, prepared by Spontaneous Impassation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

MEDICAL SESSION, 1854-55.

(Concluded from page 240.)

Provincial Hospitals & Medical Schools.

QUEEN'S HOSPITAL, BIRMINGHAM.

*Honorary Physician*—Dr. Booth.

*Physicians*—Dr. Birt Davies, Dr. Heslop, and Dr. G. Fife.

*Honorary Surgeon*—Mr. Cox.

*Surgeons*—Mr. W. Sands Cox, Mr. Knowles, and Mr. Langston Parker.

*Lying-in Department*—Mr. S. Berry.

Medical and surgical practice of the hospital, for one year, £10 10s.; three years, £21.

The respective offices of physicians' clerks and surgeons' dressers are filled up by the medical officers from the students of the Queen's Hospital, after public examination, and the production of testimonials of good conduct, without any additional fee.

QUEEN'S COLLEGE, BIRMINGHAM.

*Principal*—Lord Lyttelton, F.R.S.

*Vice-Principal and Warden*—The Rev. Chancellor Law.

*Dean of the Medical Faculty*—W. Sands Cox, F.R.S.

WINTER SESSION.

*Surgical Anatomy*: Mr. W. Sands Cox.

*Anatomy and Physiology*: Dr. Heslop. Single course,

*Descriptive Anatomy*: Mr. Langston Parker. Aggregate fee for one course in these classes, £7 7s.

*Medicine*: Dr. Jas. Johnstone. Single course, £5 5s.

*Surgery*: Mr. W. Sands Cox. Single course, £3 3s.; perpetual, £5 5s.

*Practical Anatomy and Dissections*: Mr. D. Bolton and Mr. W. C. Freer. One course, £4 4s.

*Chemistry*: Mr. G. Shaw. One course, £4 4s.

*Practical Chemistry*, one course, £3 3s.

SUMMER SESSION.

*Materia Medica and Therapeutics*: Dr. G. Fife. Single course, £5 5s.

*Midwifery, &c.*: Mr. Berry. Single course, £4 4s.

*Forensic Medicine*: Dr. J. Birt Davies. Single course, £4 4s.

*Botany*: Mr. Knowles. Single course, £4 4s.

*Comparative Anatomy and Zoology*: Mr. R. C. R. Jordan, M.B. One course, £3 3s.

*Medical Tutor*: Mr. R. C. R. Jordan, M.B.

The three year's course of study required by the College of Surgeons of England, the Society of Apothecaries, and the Army and Navy Boards, may be attended on the payment of a composition fee of £62 10s.

College fees, commons, residence, &c., £50 for the year, to be made by three instalments,—£18 on October 1st, £18 on January 1st, and £12 on May 1st.

The medical tutor resides in College, to prepare the junior students, non-resident as well as resident, for the matriculation examination of the University of London, to devote daily a certain number of hours to the senior students, non-resident as well as resident, in the dissecting-room, and to examine them from time to time upon the subjects of the various lectures.

Four Warneford scholarships of £10 each, tenable for two years, are founded for students who have resided for twelve months in the College, and are approved by the council.

SYDENHAM COLLEGE, BIRMINGHAM.

*Principal*—Dr. Bell Fletcher.

*Treasurer*—Dr. James Russell.

*Honorary Secretaries*—Mr. Alfred Baker and Mr. Alfred Hill.

WINTER SESSION.

*Anatomy, Physiology, and Pathology*: Dr. J. W. Keyworth, at one. One session, £4 4s.; perpetual, £9 9s.

*Practical Anatomy and Demonstration*: Mr. G. Elkington, Mr. Frowd Jones, and Mr. J. Postgate, at eight A.M. One session, £4 4s.; perpetual, £7 7s.

*Medicine*: Dr. Bell Fletcher, at four. One session, £4 4s.; perpetual, £7 7s.

No. 1621.

*Surgery*: Mr. A. Baker, at five. One session, £4 4s.; perpetual, £7 7s.

*Chemistry*: Mr. A. Hill, at five. One session, £4 4s.; perpetual, £7 7s.

SUMMER SESSION.

*Midwifery, &c.*: Dr. Elkington and Mr. V. W. Blake, at eight A.M. One session, £3 3s.; perpetual, £4 4s.

*Forensic Medicine*: Mr. W. C. Orford, at one. One session, £3 3s.; perpetual, £4 4s.

*Botany*: Mr. F. Westcott, at three. One session, £3 3s.; perpetual, £4 4s.

*Materia Medica, &c.*: Mr. John Bassett, at four. One session, £4 4s.; perpetual, £7 7s.

*Practical Chemistry*: Mr. A. Hill. One session, £2 2s.

Composition fee for all the lectures required by the College and Hall, £42; matriculation fee, £1 1s.; reading-room and museum fee, (annually,) £1 1s.; porter's fee for each class, 2s. 6d.

THE GENERAL HOSPITAL, BIRMINGHAM.

*Physicians*—Dr. Johnstone, Dr. Eccles, Dr. Evans, and Dr. Fletcher.

*Surgeons*—Mr. Crompton, Mr. Amphlett, Mr. Alfred Baker, and Mr. Oliver Pemberton.

*House-Physician*—Dr. Wade.

*House-Surgeon*—Mr. David Johnson.

*Dispenser*—Mr. J. Smith.

*Secretary*—Mr. Wm. R. Hughes.

This hospital contains 220 beds.

Upwards of 2000 in-patients, and upwards of 15,000 out-patients, are admitted annually, of which nearly 5000 are accidents.

Resident pupils are received into the hospital, as also non-resident pupils and dressers.

MEDICAL PRACTICE.

Six months ...	£7	7	0
Twelve months ...	10	10	0
Eighteen months...	12	12	0
Three years ...	21	0	0

SURGICAL PRACTICE.

Six months ...	£8	8	0
Twelve months ...	10	10	0
Eighteen months...	15	15	0
Three years ...	21	0	0

For dresserships, in addition to the above fees:—Six months, £8 8s.; twelve months, £12 12s.; eighteen months, £15 15s.; three years, £26 5s.

BRISTOL MEDICAL SCHOOL.

WINTER SESSION, COMMENCING OCTOBER 1ST, 1854.

*Surgery*: Mr. Clark and Mr. Prichard, Monday, Wednesday, and Friday, at a quarter after eight A.M. Sessional course, £4 4s.; unlimited, £6 6s.

*Theory and Practice of Physic*: Dr. Budd and Dr. Stanton, Monday, Tuesday, Wednesday, and Friday, at a quarter after nine A.M. Sessional course, £4 4s.; unlimited, £6 6s.

*Chemistry*: Mr. Herapath, last four days of the week, at a quarter after nine A.M. Sessional course, £5 5s.; unlimited, £8 8s.

*General Anatomy and Physiology*: Dr. Brittan and Mr. Coe, daily, at a quarter after ten. Sessional course, £5 5s.; unlimited, £9 9s.

*Descriptive and Surgical Anatomy*: Dr. Brittan and Mr. C. Leonard, daily, at three. Sessional course, £5 5s.; unlimited, £9 9s.

SUMMER SESSION, COMMENCING MAY 1ST, 1855.

*Botany and Vegetable Physiology*: Mr. Robert Etheridge, daily, at six P.M. Sessional course, £3 3s.; unlimited, £5 5s.

*Materia Medica and Therapeutics*: Dr. Stanton, daily, at eight A.M. Sessional course, £4 4s.; unlimited, £6 6s.

*Midwifery*: Dr. J. G. Swayne, daily, at nine. Sessional course, £4 4s.; perpetual, £6 6s.

*Forensic Medicine*: Dr. Martyr, and Chemical Toxicology, Mr. Herapath, daily, at ten. Sessional course, £3 3s.; unlimited, £5 5s.

*Practical Chemistry*: Mr. Herapath. Sessional course, £3 3s.

Fee for the perpetual attendance on all the above courses, (excepting practical chemistry,) forty-five guineas.

The dissecting-rooms are under the superintendence of Mr. C. Leonard.

At the conclusion of the session, prizes for the students of the several years will be distributed in accordance with the regulations of the school.

M

## BRISTOL ROYAL INFIRMARY.

## MEDICAL AND SURGICAL HOSPITAL PRACTICE.

*Physicians*—Dr. Wallis, Dr. Lyon, Dr. Bernard, Dr. Wm. Budd.

*Honorary and Consulting Physician*—Dr. Howell.

*Surgeons*—Mr. Harrison, Mr. Morgan, Mr. Clark, Mr. Green, Mr. Prichard.

*Honorary and Consulting Surgeon*—Mr. R. Smith.

*House-Surgeon*—Mr. H. A. Hore.

*Assistant House-Surgeon*—Mr. R. Crisp.

This hospital contains 242 beds; 114 being allotted to medical cases, and equally divided between males and females; and 128 to surgical cases, of which 72 are occupied by males, and 56 by females. In 1853, 2699 in-patients were admitted, and about 19,800 patients relieved.

The physicians and surgeons are in daily attendance, from half-past eleven A.M. till two P.M.

Clinical lectures are delivered weekly by the surgeons, and occasionally, upon cases of interest, by the physicians. Surgical casualties are attended to, in the accident ward, at all hours, by the resident dresser, under the immediate superintendence of the house-surgeon. By payment of a small fee, students may be instructed in practical pharmacy, in the laboratory and dispensary. Medical and surgical pupils may become, when qualified, clinical clerks in their respective departments. Pupils have access to the library by payment of £1.

## HOSPITAL ATTENDANCE FEES.

Surgeon's pupil, (non-assistant,) first year, £20; second year, £12 10s.; third year, £7 10s.; for three years, at one payment, £35.

Surgeon's pupil, (dresser,) first year, £35; second year, £30; third year, £25; for three years, at one payment, £80.

Physician's pupil, one year, £15; eighteen months, £20; and for unlimited attendance, £30.

Each dresser resides in the infirmary for a week, in rotation, to attend upon the casualties.

**SUPPLE SCHOLARSHIPS.**—Two scholarships, founded by the late R. Suple, Esq., of Clifton, will be awarded annually to the two most approved students attending the medical and surgical practice.

## ST. PETER'S HOSPITAL.

This hospital contains 228 beds, and, upon an average, 922 in-patients and 2230 out-patients are annually admitted. It has wards specially devoted to lying-in patients, and an asylum for pauper lunatics. The medical officers are in attendance daily, from twelve to two P.M. Opportunity for studying practical pharmacy may be had, upon the payment of a small fee. Physician's pupil's fee, £15 per annum.

Pupils are also admitted at the Bristol General Hospital, and at the Bristol Dispensary. The medical practice of the General Hospital is received by the Apothecaries' Company on the same terms as that of a dispensary. Fee for attendance on the physicians' practice for eighteen months, £15.

## HULL AND EAST RIDING SCHOOL OF MEDICINE AND ANATOMY.

## WINTER SESSION, COMMENCING OCTOBER 3RD, 1854.

Anatomy, Physiology, and Pathology: Mr. R. M. Craven, jun., daily, at eight. Sessional, £5 5s.; perpetual, £8 8s.

Anatomical Demonstrations: Dr. King, daily, at five. Sessional, £4 4s.; perpetual, £6 6s.

Principles and Practice of Medicine: Dr. Sandwith, daily, at three. Sessional, £5 5s.; perpetual, £7 7s.

Principles and Practice of Surgery: Mr. J. H. Gibson, Tuesday, Thursday, and Saturday, at four. Sessional, £3 3s.; perpetual, £5 5s.

Chemistry: Mr. Beckett, Tuesday, Wednesday, Thursday, and Friday, at eight. Sessional, £5 5s.

## SUMMER SESSION, COMMENCING MAY 1ST, 1855.

Midwifery, and Diseases of Women and Children: Mr. Hardey, daily, at seven A.M. Sessional, £4 4s.; perpetual, £6 6s.

Materia Medica and Therapeutics: Dr. Daly, daily, at eight A.M. Sessional, £5 5s.; perpetual, £7 7s.

Forensic Medicine: Mr. Munroe, Monday, Wednesday, Friday, and Saturday, at four. Sessional, £3 3s.

Botany: Mr. Reckitt, Monday, Wednesday, Friday, and Saturday, at three. Sessional, £3 3s.

Perpetual to all the lectures, (except chemistry,) £42.

Attendance at the above lectures and at the hospital will confer the same qualification as is obtained in the medical schools of London.

Application for tickets may be made to Mr. R. M. Craven, jun., 14, Albion-street, Hull.

## LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE.

## WINTER SESSION.

Introductory Lecture by Mr. F. D. Fletcher, on Monday, October 2nd, at two P.M.

Anatomy, Physiology, and Pathology: Mr. Long, daily, at eight A.M. One course, £5 5s.

Anatomical Demonstrations and Dissections: Mr. F. D. Fletcher, daily, (except Saturday,) at six. One course, £3 3s.

Chemistry and Pharmacy: Dr. R. H. Brett, Tuesday, Thursday, and Saturday, at three. One course, £5 5s.

Principles and Practice of Physic: Dr. Dickinson, daily, (except Saturday,) at five. One course, £5 5s.

Principles and Practice of Surgery: Mr. Cooper, Monday, Wednesday, Thursday, and Friday, at four. One course, £4 4s.

Clinical Medicine, with Instruction in Morbid Anatomy: Dr. Dickinson, Friday, at one.

Clinical Surgery, with Instruction in Morbid Anatomy: Mr. Cooper, Tuesday, at one.

## SUMMER SESSION.

Materia Medica and Therapeutics: Dr. Inman, daily, at three. One course, £4 4s.

Botany: Dr. Nevins, daily, at eight A.M. One course, £3 3s.

Midwifery, and Diseases of Women and Children: Mr. Betty, daily, at four. One course, £4 4s.

Medical Jurisprudence: Dr. Brett and Mr. Fletcher, four days weekly, at two. One course, £3 3s.

Practical Chemistry: Dr. Beett, three days weekly, at nine. One course, £3 3s.

Ophthalmic Medicine and Surgery: Dr. R. Hibbert Taylor, Tuesday and Friday, at two. One course, £1 1s.

Clinical Medicine, with Instructions in Morbid Anatomy: Dr. Dickinson, Friday, at one.

Clinical Surgery, with Instruction in Morbid Anatomy: Mr. Cooper, Tuesday, at one.

Fees to all the lectures required by the Hall and College, (including Practical Chemistry,) £45, payable in advance.

A gold medal, of the value of £10 10s., awarded annually to the student who distinguishes himself most in a general examination on all subjects taught at the school, provided that sufficient merit be evinced, together with six months' free residence, dressership, and clerkship, in the infirmary, and the title of Liverpool Royal Infirmary Medical Scholar. The committee give free residence every six months to two pupils, elected from amongst the students after examination by the lecturers.

**HOSPITAL PRACTICE.**—Students are admitted to the Medical and Surgical Practice of the Liverpool Infirmary, from ten to one daily. The infirmary contains 226 beds.

**FEES FOR ATTENDANCE.**—Medical and Surgical Practice: for six months, £10 10s.; for the first year, £18 18s.; for the second, £12 12s.; for the third, £10 10s.; for three years, £36 15s.

Six dressers and six clinical clerks will be elected quarterly by selection and examination from amongst the house and out-pupils of the infirmary, from the students attending the school in their second or third session, and from all medical pupils who have entered on their third year of professional education. The office will be tenable for two successive periods. Pupils of the infirmary are admitted to learn pharmacy in the shop for six months.

## LIVERPOOL NORTHERN HOSPITAL.

*Physicians*—Dr. Scott, Dr. Dundas, and Dr. Inman.

*Surgeons*—Mr. Bainbridge, Mr. Jones, and Mr. Chalmers.

*Junior Surgeon*—Mr. Millett Davis.

*House-Surgeon*—Mr. Wall.

*Junior House-Surgeon*—Mr. Waterhouse.

Terms for hospital attendance:—Six months, £9 9s.; one year, £12 12s.; unlimited, £31 10s.

The hospital contains 120 beds, and is chiefly devoted to the reception of acute diseases and severe accidents.

Clinical lectures are delivered by the physicians and surgeons.

### LIVERPOOL COLLEGE OF CHEMISTRY,

*Duke-street.—Established 1849.*

Courses of practical instruction under the direction of Dr. Sheridan Muspratt, F.R.S.E., and assistants.

Certificates of attendance are acknowledged by the University and Apothecaries' Hall of London, and the Apothecaries' Hall of Ireland, &c.

**FEES, PAYABLE IN ADVANCE.**—Students working every day in the week, £14 14s. per session; four days, £12 12s.; three days, £10 10s.; two days, £9 9s.; one day, £8 8s.; half a day, £5 5s.; fee for three years, 50 guineas.

Analyses and assays of all kinds are undertaken.

### LEEDS GENERAL INFIRMARY.

*Physicians*—Dr. Wilson, Dr. Chadwick, and Dr. Heaton.

*Surgeons*—Mr. Smith, Mr. T. P. Teale, and Mr. S. Hey.

Clinical lectures on Medical Cases in the Infirmary, by Dr. Chadwick and Dr. Heaton; on the Surgical Cases, by the surgeons.

### LEEDS SCHOOL OF MEDICINE.

#### WINTER SESSION.

Introductory Lecture, by Mr. Ikin, October 2nd, at twelve o'clock.

Anatomy, Physiology, and Pathology: Mr. Ikin, Mr. S. Hey, Mr. W. N. Price, and Mr. C. G. Wheelhouse, five days in the week, at twelve o'clock. First season, £6 6s.; second season and perpetual, £4 4s.

Anatomy, Descriptive: Mr. W. N. Price, and Mr. C. G. Wheelhouse, Monday, Tuesday, Thursday, and Friday, at ten A.M. First season, £4 4s.; second season and perpetual, £3 3s.

Principles and Practice of Surgery: Mr. Hey and Mr. Nunneley, Tuesday and Thursday, at a quarter before seven P.M., and Saturday, at ten A.M. First season, £3 3s.; second season and perpetual, £2 2s.

Chemistry: Mr. Morley and Mr. Scattergood, daily, (except Saturday.) First season, £4 4s.; second season and perpetual, £3 3s.

Principles and Practice of Physic: Dr. Chadwick and Dr. Heaton, daily, (except Saturday,) at five P.M. First season, £5 5s.; second season and perpetual, £3 3s.

#### SUMMER SESSION.

Materia Medica and Therapeutics: Mr. Bishop, daily, at twelve. First season, £5 5s.; second season and perpetual, £3 3s.

Midwifery and Diseases of Women and Children: Mr. Smith and Mr. Braithwaite, daily, at seven A.M. First season, £3 3s.; second season and perpetual, £2 2s.

Forensic Medicine: Dr. Pyemont Smith, Monday, Tuesday, Thursday, and Friday, at ten A.M. First season, £2 12s. 6d.; second season and perpetual, £1 11s. 6d.

Botany: Dr. Heaton, Monday, Tuesday, Thursday, and Friday, at five o'clock. First season, £2 12s. 6d.; second season and perpetual, £1 11s. 6d.

Practical Chemistry: Mr. Scattergood.

Fee to all the courses, (except Practical Chemistry,) £42.

Clinical lectures at the General Infirmary, on medical cases, by Dr. Chadwick and Dr. Heaton; on surgical cases, by Mr. Smith, Mr. T. P. Teale, and Mr. S. Hey; on ophthalmic and aural practice, at the Eye and Ear Infirmary, by Mr. Nunneley.

### MANCHESTER ROYAL SCHOOL OF MEDICINE AND SURGERY.

#### WINTER SESSION.

Anatomy and Physiology: Mr. Turner and Mr. W. Smith, daily, at twelve o'clock. One course, £4 4s.

Descriptive and Microscopic Anatomy: Mr. Wm. Smith, daily.

Practical Anatomy and Demonstrations: Mr. Lund, who

attends in the dissecting-room from ten to twelve, and from two to four.

Principles and Practice of Medicine: Dr. H. Browne, daily, (except Saturday,) at five. One course, £4 4s.

Principles, Practice, and Operations of Surgery: Mr. Orr, Monday, Wednesday, and Friday, at 4 P.M. One course, £4 4s.

Chemistry: Dr. Allan, Monday, Tuesday, and Friday, at ten. One course, £4 4s.

Hospital Practice: daily, from half-past nine to twelve.

Clinical Medicine and Surgery, at the Royal Infirmary, by the Physicians and Surgeons to the Hospital.

#### SUMMER SESSION.

Materia Medica, Medical Botany, and Therapeutics: Mr. Childs. One course, £4 4s.

Midwifery, and the Diseases of Women and Children: Mr. Heath. One course, £4 4s.

Forensic Medicine: Mr. Greaves. One course, £3 3s.

Botany: Mr. Grindon. One course, £3 3s.

Anatomy, Physiology, and Pathology of the Eye: Mr. Hunt and Mr. Lund. One course, £1 1s.

Practical Chemistry: Dr. Allan. One course, £3 3s.

General Pathology and Morbid Anatomy: Dr. Renaud. One course, £2 2s.

Perpetual fee to the whole of the lectures required to qualify for examination at the London University, the Royal College of Surgeons, and the Apothecaries' Company, £42.

The winter session commences on the 2nd of October, and terminates at the end of March. The summer session begins on the 1st of May, and terminates at the end of July.

**SCHOLARSHIPS.**—Three scholarships will be open for competition to the students of the school, of the value respectively of £20, tenable for two years; £15, tenable for one year; £10, tenable for one year.

Introductory address, by Mr. Childs, on October 2nd, at twelve o'clock.

### CHATHAM-STREET SCHOOL OF MEDICINE, MANCHESTER.

#### WINTER SESSION.

Anatomy, Descriptive, and Surgical: Mr. J. S. Fletcher and Mr. J. O. Fletcher, daily, (except Saturday,) at nine.

Anatomy, Practical, and Superintendence of Dissections: Mr. Murphy.

Anatomy, General, and Physiology: Mr. Dumville, daily, (except Saturday,) at half-past twelve.

Medicine: Dr. T. H. Watts, Monday, Wednesday, and Friday, at quarter to four.

Surgery: Mr. G. Southam, Monday, Wednesday, and Friday, at quarter to five.

Chemistry: Mr. D. Stone, Monday, Wednesday, and Thursday, at half-past eleven.

Clinical Medicine: Dr. M. A. Eason Wilkinson.

Psychological Medicine: Dr. Noble.

#### SUMMER SESSION.

Materia Medica and Therapeutics: Mr. Somers, daily, (except Saturday,) at half-past twelve.

Midwifery and Diseases of Women: Dr. Whitehead, daily, (except Saturday,) at nine.

Diseases of Infancy and Childhood: Dr. S. Merri.

Forensic Medicine: Dr. Aikenhead, Monday, Wednesday, Thursday, and Friday, at four.

Practical Chemistry: Mr. D. Stone, Monday and Thursday, from half-past eleven to half-past one.

Pathology: Dr. Watts, Monday, Wednesday, and Friday, at five.

Diseases of the Eye: Mr. Armstrong Todd.

Botany: Dr. Joseph Stone.

Histology: Dr. W. Jepson, Wednesday, at three.

Psychological Medicine: Mr. D. Noble.

Perpetual fee for attendance on all the lectures, £42 10s.

Hospital practice at the Royal Infirmary, where clinical lectures on medicine and surgery are regularly delivered by the physicians and surgeons of the Institution. Hospital attendance, daily, from ten to half-past eleven.

Three scholarships will be offered for competition at the termination of the session:—One of £20, for third year's students; one of £15, for second year's students; one of £10, for first year's students.

## NEWCASTLE-UPON-TYNE INFIRMARY.

*Consulting Physicians*—Dr. Thos. E. Headlam, Dr. Darnell Bulman, Dr. John Cargill, Dr. John M. Bates.  
*Physicians*—Dr. David B. White, Dr. Edward Charlton, Dr. Dennis Embleton, Dr. Thos. Humble.  
*Surgeons*—Mr. T. M. Greenhow, Mr. Henry Heath, Sir John Fife, Mr. H. G. Potter.  
*House-Surgeon and Secretary*—Mr. Charles John Gibb.

The Newcastle Infirmary contains 230 beds.  
 Clinical lectures are regularly delivered.  
 Medical and surgical practice, twelve months, £7 7s.; perpetual, £17 17s.

1678 in-patients, 3742 out-patients, and 4242 casual patients, were treated last year.

Introductory address by Dr. Whitehead, on Monday, Oct. 2nd, at four.

## NEWCASTLE-ON-TYNE COLLEGE OF PRACTICAL SCIENCE,

IN CONNEXION WITH THE UNIVERSITY OF LONDON.

## WINTER SESSION.

Introductory lecture by Mr. H. G. Potter, at eight o'clock.  
*Anatomy, General, Comparative, Microscopic, and Descriptive*: Mr. Furness, Mr. Newton, and Mr. Crafter.

*Regional Anatomy and Demonstrations*: Mr. M'Nay, Mr. J. B. Fife, and Mr. W. H. Preston, daily, (except Saturday,) at three. Fee, £3 3s.

*Principles and Practice of Physic*: Dr. George Robinson, daily, (except Saturday,) at four. Fee, £3 3s.

*Principles and Practice of Surgery*: Sir John Fife, Mr. H. G. Potter, and Mr. W. H. Fife, Monday, Wednesday and Friday, at five. Fee, £3 3s.

*Principles of Chemistry*: Mr. A. J. Gray, jun., Monday, Tuesday, Wednesday, and Thursday, at seven. Fee, £4 4s.

A course of instruction in the art of General and Anatomical Modelling, by Mr. Dinsdale. Fee, £4 4s.

The Rev. W. Spencer, M.A., will direct the studies of gentlemen in Mathematics, Natural Philosophy, and Medical Classics.

## SUMMER SESSION.

*Midwifery and Diseases of Women and Children*: Dr. W. Dawson, daily, at eight A.M. Fee, £3 3s.

*Botany, General, Microscopic, and Physiological*: Mr. R. B. Sanderson, jun., Monday, Wednesday, and Friday, at five. Fee, £3 3s.

*Medical Jurisprudence*: Dr. Dawson, Mr. S. W. Rayne, and Dr. George Robinson, Monday, Tuesday, Thursday and Friday, at five. Fee, £3 3s.

*Materia Medica and Therapeutics*: Mr. G. Gibson and Mr. Crafter, daily, at three. Fee, £3 3s.

*Practical Chemistry*: By the Professor of Chemistry.

*Operative Surgery*: Mr. Furness, Mr. S. W. Rayne, and Mr. J. B. Fife. Fee, £1 1s.

*Pathology and Morbid Anatomy*: Mr. J. Nicholson, Tuesday, at five. Fee, £1 1s.

Special lectures will be delivered on—

*Clinical Ophthalmic Surgery*: Mr. J. B. Fife, at the Newcastle Eye Infirmary, Tuesdays, at one.

*Chemistry and the Microscope applied to Practical Pathology*: Mr. J. Nicholson.

At the end of the summer session for 1855, an exhibition of £20 for the best examination in all the medical sciences will be awarded.

## NEWCASTLE-ON-TYNE COLLEGE OF MEDICINE,

IN CONNEXION WITH THE UNIVERSITY OF DURHAM, AND ALSO WITH THE UNIVERSITY OF LONDON.

## WINTER SESSION.

*Anatomy and Physiology*: Dr. Embleton and Mr. C. J. Gibb, daily, at eight A.M. Fee, £4 4s.

*Surgical Anatomy and Demonstrations*: Mr. J. S. Pearse, daily, (except Saturday,) at four. Fee, £3 3s.

*Medicine*: Dr. Edward Charlton, daily, (except Saturday,) at five. Fee, £3 3s.

*Mental Diseases*: Dr. Donald Mackintosh.

*Surgery*: Mr. Henry Heath and Mr. G. Y. Heath, Monday, Wednesday, and Friday, at seven. Fee, £3 3s.

*Chemistry*: Dr. T. Richardson, Monday, Wednesday, Thursday, and Friday, at nine A.M. Fee, £4 4s.

## SUMMER SESSION.

*Midwifery and Diseases of Women and Children*: Mr. S. M. Frost and Dr. C. Gibson, daily, at eight A.M. Fee, £3 3s.

*Botany*: Messrs. J. Thornhill and D. Oliver, jun., Monday, Wednesday, Thursday, and Friday, at nine A.M. Fee, £3 3s.

*Medical Jurisprudence*: Mr. W. Robinson and Mr. W. Chater, Monday, Tuesday, Thursday, and Friday, at four. Fee, £3 3s.

*Materia Medica and Therapeutics*: Dr. Humble, daily, (except Saturday,) at three. Fee, £3 3s.

*Practical Chemistry*: Dr. T. Richardson.

*Operative Surgery*: Mr. G. Y. Heath.

*Pathological Anatomy*: Dr. S. Fenwick and Mr. C. J. Gibb, Wednesday, at four.

Perpetual ticket to all the lectures, qualifying for the diploma of the College of Surgeons, and the licence of the Apothecaries' Society, (exclusive of Practical Chemistry,) Forty Guineas.

The winter session will commence on Monday, Oct. 2nd. The introductory address will be delivered by Dr. Embleton.

## SHEFFIELD GENERAL INFIRMARY.

*Physicians*—Dr. Thomson, Dr. Branson, Dr. de Bartolomé.

*Surgeons*—Mr. Henry Jackson, Mr. Samuel Gregory, and Mr. Barber.

*House-Surgeon*—Mr. Tinsley.

Fee for medical practice, one year, £10 10s.; perpetual, £15 15s.

Fee for surgical practice, one year, £10 10s.; perpetual, £21.

Upwards of 4000 patients annually attend at this hospital.

## SHEFFIELD MEDICAL INSTITUTION.

WINTER SESSION, COMMENCING OCT. 3RD, 1854.

*General Anatomy and Physiology*: Mr. S. Gregory, Mr. Skinner, and Mr. Allanson, daily, at four. One course, £4 4s.

*Practical Anatomy and Demonstrations*: Mr. H. Walker and Mr. W. F. Favell, daily, at one. One course, £2 2s.

*Chemistry*: Dr. Bingley, daily, at one. One course, £6 6s.

*Medicine*: Dr. Bartolomé, daily, at five. One course, £4 4s.

*Clinical Medicine*: Dr. Bartolomé and Dr. Law.

*Surgery*: Mr. Barber, three days in the week, at seven. One course, £3 3s.

*Clinical Surgery*: By the surgeons of the Infirmary.

SUMMER SESSION, COMMENCING MAY 1ST, 1855.

*Midwifery and Diseases of Women and Children*: Mr. Jackson and Mr. Atkin, daily, at five. One course, £3 3s.

*Materia Medica and Therapeutics*: daily, at five. One course, £4 4s.

*Medical Jurisprudence*: Dr. Law, daily, at eight A.M. One course, £3 3s.

*Botany*: Mr. H. Walker, daily, at four. One course, £3 3s.

*Practical Chemistry*.

The fees for all the lectures required by the College of Surgeons and the Society of Apothecaries, (exclusive of the fee for Practical Chemistry,) will not exceed £42.

## YORK HOSPITAL AND DISPENSARY.

*Physicians of the Hospital*—Dr. Simpson, Dr. Shann.

*Surgeons of the Hospital*—Mr. Hey, Mr. Husband.

*Physicians of the Dispensary*—Dr. Simpson, Dr. Laycock, Dr. Shann.

*Surgeons of the Dispensary*—Mr. Dodsworth, Mr. W. Matterson, Mr. Moore, Mr. Keyworth.

## MEDICAL PRACTICE.

## SURGICAL PRACTICE.

Eighteen months ...	£12 12	One year ...	£12 12
Perpetual ...	15 15	Perpetual ...	15 15
Perpetual to medical and surgical practice, £26 5s.			

Pupils entering to the surgical practice will be allowed to dress the patients in their turn without additional fee.

Attendance of the physicians and surgeons at the hospital, Mondays and Thursdays, at eleven A.M.

Attendance of the physicians and surgeons at the Dispensary, Mondays, Wednesdays, Fridays, and Saturdays, at eleven A.M. Pupils entering to the surgical practice of the hospital, or attending the surgical lectures, will be allowed to attend the practice of the Ophthalmic Institution without additional fee.

Clinical instruction is given by the physicians and surgeons of the hospital in their visits, and also by Dr. Laycock, by means of lectures and examinations upon the cases at the dispensary. Payment included in the hospital fee.

Clinical lectures in medicine and surgery will be given by Dr. Simpson, Dr. Belcombe, and Mr. Hey, at the hospital, and by Mr. Moore and Mr. Keyworth, at the dispensary.

## YORK MEDICAL AND SURGICAL SCHOOL.

### WINTER SESSION.

Anatomy, Physiology, and Pathological Anatomy: Mr. E. Allen and Mr. Hornby, daily, at four. Entire course, £6 6s.; perpetual, £10 10s.

Anatomy, Demonstrations, and Dissections: Mr. Hornby and Mr. North, Monday, Wednesday, Friday, and Saturday, at half-past nine. Entire course, £4 4s.; perpetual, £7 7s.

Medicine: Dr. Laycock, daily, (except Saturday,) at three. Entire course, £5 5s.; perpetual, £8 8s.

Surgery: Mr. H. Keyworth, Monday, Wednesday, and Friday, at seven P.M. Entire course, £3 3s.; perpetual, £5 5s.

Chemistry: Mr. Procter, daily, (except Saturday,) at eight P.M. Entire course, £5 5s.; perpetual, £7 7s.

### SUMMER SESSION.

Materia Medica: Mr. C. Williams, daily, at half-past nine. Entire course, £5 5s.; perpetual, £7 7s.

Midwifery, &c.: Mr. J. Allen and Mr. Anderson, daily, at eight A.M. Entire course, £3 3s.; perpetual, £5 5s.

Medical Jurisprudence: Mr. Procter, four days a week, at ten. Entire course, £2 12s.; perpetual, £4 4s.

Botany: Mr. Moore, daily, at five. Entire course, £2 12s.; perpetual, £4 4s.

Perpetual fee to all the above courses, £42.

Student's subscription to the medical library, 10s. 6d. per annum.

Introductory lecture by Mr. Hornby, on the 2nd of October, at two.

## Scotch and Irish Universities, Colleges, and Medical Schools.

### UNIVERSITY OF EDINBURGH.

THE Session will be publicly opened on Tuesday, October 31st, at two o'clock P.M., when an address will be delivered by the Principal, Dr. John Lea.

#### FACULTY OF MEDICINE.

Dietetics, Materia Medica, and Pharmacy: Dr. Christison, at nine.

Chemistry: Dr. Gregory, at ten.

Surgery: Professor Miller, at ten.

Institutes of Medicine: Dr. Bennett, at eleven.

General Pathology: Dr. Henderson, at eleven.

Clinical Surgery, Monday and Thursday: Professor Syme, at twelve.

Clinical Medicine, Tuesday and Friday: Drs. Alison, Christison, and Bennett, at twelve.

Anatomy: Professor Goodsir, at one.

Natural History: Professor Edward Forbes, at two.

Midwifery and Diseases of Women and Children: Dr. Simpson, at two.

Practice of Physic: Dr. Alison, at three.

Royal Infirmary, at noon, daily.

Practical Anatomy, under the superintendence of Professor Goodsir.

Practical and Analytical Chemistry, under the superintendence of Dr. Gregory.

During the summer session, lectures will be given on the following branches of education:—Botany, by Dr. Balfour; Histology, by Dr. Bennett; Medical Jurisprudence, by Dr. Traill; Theory of Music, by Professor Donaldson; Military Surgery, by Sir George Ballingall; Clinical Medicine; Clinical

Surgery, by Professor Syme; Comparative Anatomy, by Professor Goodsir; Anatomical Demonstrations, by Professor Goodsir; Practical Chemistry and Pharmacy; Practical Anatomy; Natural History.

MATRICULATION.—Every student, in the Faculties of Arts, Law, and Medicine, before entering with any professor, must produce a matriculation ticket for the ensuing session.

#### STATUTES RELATIVE TO THE DEGREE OF M.D.

The candidate must have been engaged in medical study for four years, during at least six months of each, in the University of Edinburgh, or in some other university where the degree of M.D. is given; unless, in addition to three such sessions, he has attended, during six winter months, the medical and surgical practice of a general hospital, with at least eighty patients, and during the same period a course of practical anatomy.

He must give sufficient evidence—

That he has studied, under professors of medicine in this or in some other university, anatomy, chemistry, materia medica and pharmacy, institutes of medicine, practice of medicine, surgery, midwifery, and the diseases peculiar to women and children, general pathology, practical anatomy, (unless it has been attended in the year of extra-academical study allowed,) during courses of six months.

Clinical medicine—that is, the treatment of patients in a public hospital under a professor of medicine, by whom lectures on the cases are given, during courses of six months, or two courses of three months each.

Clinical surgery, medical jurisprudence, botany, and natural history, including zoology, during courses of at least three months each.

That besides the course of clinical medicine, he has attended, for six months of another year, the medical or surgical practice of a general hospital accommodating eighty patients.

That he has attended, for at least six months, by apprenticeship or otherwise, the art of compounding and dispensing drugs.

That he has attended, for at least six months, by apprenticeship or otherwise, the out-practice of an hospital, or the practice of a dispensary, or that of a physician, surgeon, or member of the London or Dublin Society of Apothecaries.

That he has studied, for one year previous to his graduation, in the University of Edinburgh.

Every candidate for the degree of Medicine must deliver before the 31st of March of the year in which he proposes to graduate, to the dean of the Faculty of Medicine,—

First.—A declaration, in his own handwriting, that he is twenty-one years of age, or will be so before the day of graduation; and that he will not be then under articles of apprenticeship to any surgeon or other master.

Secondly.—A statement of his studies, as well in literature and philosophy as in medicine, accompanied with proper certificates.

Thirdly.—A medical dissertation, composed by himself, in Latin or English.

Before a candidate be examined in Medicine, the Medical Faculty shall ascertain, by examination, that he possesses a competent knowledge of Latin.

They shall then proceed to examine him, either *visu voce* or in writing—1st, on Anatomy, Chemistry, Botany, Institutes of Medicine, and Natural History, bearing chiefly on Zoology; and, 2ndly, on Materia Medica, Pathology, Practice of Medicine, Surgery, Midwifery, and Medical Jurisprudence. Students may be admitted to an examination on the first division at the end of the third year of their studies.

If the candidate have satisfied the Medical Faculty, he will be summoned, on the 31st of July, to defend his thesis; and finally, if the senate think fit, he shall be admitted, on the first lawful day of August, to the degree of Doctor.

### ROYAL COLLEGE OF PHYSICIANS, EDINBURGH.

ABSTRACT OF THE REGULATIONS RELATING TO ADMISSION TO THE FELLOWSHIP, DATED AUGUST, 1852.

No one is admissible as a Fellow who has not obtained the degree of Doctor of Medicine. All petitions for the Fellowship are determined by ballot.

Graduates of foreign universities must previously submit to

an examination before the examiners of the College, which shall consist—

1. Of a dissertation in English, on some subject in the practice of physic selected by the examiners.
2. Of a *visd voce* examination in English, chiefly on Symptomatology, Pathology, and Therapeutics of Diseases; but in part, also, on Anatomy, Chemistry, Botany, and Physiology.
3. The examiners may institute such examination as they may consider advisable for satisfying themselves that the candidate has received a competent education.

The mode of election of a non-resident is the same as that of a resident Fellow.

The fees for a resident Fellowship amount to £105, and for a non-resident, £55, both inclusive of stamp-duty. Fee paid by a resident or non-resident Licentiate, £55, exclusive of any tax payable to government. Every resident Fellow pays an annual subscription of £1 ls. to defray the College expenses.

## ROYAL COLLEGE OF SURGEONS, EDINBURGH.

### REGULATIONS.—COURSE OF STUDY.

1. *Preliminary Instruction.*—Every candidate must have received regular instruction in the elements of mathematics, and must have acquired a knowledge of the elements of mechanical philosophy. He must also have been well instructed in the Latin language.

2. *Professional Instruction.*—The candidate must have been engaged, during a period of not less than twenty-seven months, including three winter sessions, in attending—

Anatomy, two courses of six months each. Practical Anatomy, twelve months. Chemistry, Materia Medica, and Pharmacy, Institutes of Medicine or Physiology, Practice of Medicine, and Clinical Medicine, of each one course of six months, or of the last, two courses of three months each, during the period of hospital attendance. Principles and Practice of Surgery, two courses, six months each; or Principles and Practice of Surgery, and Military Surgery,\* one course, six months each. Clinical Surgery, two courses, three months each, during the period of attendance at the hospital where they are delivered. Midwifery and Diseases of Women and Children, Medical Jurisprudence and Practical Chemistry, of each one course of three months; or, instead of the last, Analytical Chemistry, three months.

Also a course of instruction in Practical Pharmacy, at the laboratory of a surgeon or apothecary; or of a chemist and druggist recognised by the College; or of a public hospital or dispensary; and he must produce evidence that he has been engaged in compounding and dispensing medicines for six months, or a certificate of having been for two years a private pupil or apprentice of a regularly-licensed medical practitioner keeping a laboratory for dispensing medicines.

3. The six month's courses delivered in Edinburgh must consist of not fewer than 110 lectures, with the exception of clinical medicine, clinical surgery, and military surgery. The three month's courses must consist of not fewer than sixty lectures. Two London courses of three months each, on any of the above subjects, will be taken as equivalent to one six month's course.

4. The candidate must have also attended, for twenty-one months, a public general hospital containing on an average eighty patients.

All candidates for the diploma must be registered at the College, for which, annually, a fee of 5s. is paid.

Every candidate, on applying for examination will be required—1st. To produce satisfactory evidence of his having attained the age of twenty-one years; and 2ndly, to present a tabular statement exhibiting the full amount of his professional education. Unsuccessful candidates will be remitted to their studies for a period not, in any case, less than three months.

Every candidate will be required to translate into English some portion of a Latin author.

The sum payable for a diploma by ordinary candidates is £10, including all fees. Apprentices of those who were Fellows prior to 1851, pay £5 for a diploma.

*Note.*—The Licentiates of the Royal College of Surgeons in Scotland and in Ireland are exactly on the same footing in England, as to privilege in surgery, with the members of the Royal College of Surgeons of England.

\* The course of Military Surgery must be delivered by a professor of that branch in any university; or by a lecturer who, in addition to the other requisite qualifications, has served in the medical department of the army or navy, and it must consist of not less than sixty lectures.

## SURGEONS' HALL, EDINBURGH.

### WINTER SESSION.

The introductory address will be delivered by Mr. Spence, on Wednesday, November 1st, at two P.M.

Chemistry: Dr. George Wilson, at eleven.

Surgery: Mr. Mackenzie and Mr. Spence, at ten.

Natural Philosophy: Dr. George Lees, at twelve.

Clinical Medicine: Dr. W. Robertson, at the Royal Infirmary, Tuesday and Friday, at twelve.

Clinical Surgery: Mr. Mackenzie, at the Royal Infirmary, Tuesday and Friday, at twelve.

Anatomy: Dr. John Struthers, at one.

Materia Medica and Dietetics: Dr. Douglas MacLagan, at two.

Practice of Physic: Dr. Alex. Wood and Dr. W. T. Gairdner, at three.

Analytical and Practical Chemistry, (three months' course): Dr. Wilson and Dr. Macadam, nine till four.

Practical Anatomy: Dr. John Struthers and Dr. Greig, nine till four.

Anatomical Demonstrations: Dr. John Struthers, at four.

Pathology: Dr. Rutherford Haldane, Royal Infirmary, at noon, daily.

All the courses are for six months, if not otherwise specified.

### SUMMER SESSION, 1855.

Natural Philosophy: Dr. Lees.

Medical Jurisprudence: Dr. Rutherford Haldane.

Midwifery: Dr. Keiller and Dr. J. Matthews Duncan.

Clinical Surgery: Mr. Mackenzie.

Practical Anatomy, with Demonstrations: Dr. John Struthers and Dr. Greig.

Practical and Analytical Chemistry: Dr. Wilson and Dr. Macadam.

These courses are of three months each.

*FEES.*—For the first of each of the above courses, £3 5s.; for the second, £2 4s.; perpetual, £5 5s. To those who have already attended a first course in Edinburgh, the perpetual fee for that class is £2 4s. The fees for the following courses are—Natural Philosophy, Practical Chemistry, and Practical Anatomy, £3 3s.; Anatomical Demonstrations, £2 2s.; Practical Anatomy with Demonstrations, £4 4s.; Analytical Chemistry, £2 a month, or £10 for the winter session. Royal Infirmary, perpetual ticket, £12 17s.; annual, £5 7s. 6d.; half-yearly, £3 5s. 6d.; quarterly, £1 13s.; Edinburgh Maternity Hospital, six months, £1 3s.

The above courses of lectures qualify for examination at the Royal Colleges of Surgeons of Edinburgh, England, and Ireland; the Apothecaries' Hall, London; the Faculty of Physicians and Surgeons of Glasgow; the Boards of the Army, Navy, and East India Company; and also, so far as required, for the Universities of London, Oxford, Cambridge, St. Andrew's, Aberdeen, and the Queen's University, Ireland.

## UNIVERSITY OF GLASGOW.

*Principal*—Duncan Macfarlan, D.D.

*Clerk of Senate*—Thomas Anderson, M.D.

### FACULTY OF MEDICINE.

SESSION 1853-54, commencing Wednesday, Nov. 1st, 1853.

Surgery: Dr. Lawrie, at nine A.M.

Practice of Physic: Dr. John Macfarlane, at ten.

Chemistry, Practical Chemistry, and Analytical Chemistry:

Dr. T. Anderson, at ten, twelve, and from half-past nine, till half-past four.

Anatomy, Anatomical Demonstrations, and Practical Anatomy:

Dr. Allen Thomson and Dr. William Aitken, at one, eleven,

and from ten till four.

Botany: Dr. Walker Arnott, at seven P.M. (from May 7th.)

Medical Jurisprudence: Dr. Rainy, at one.

Materia Medica: Dr. John Couper, at four.

Midwifery: Dr. Pagan, at five.

Institutes of Medicine: Dr. Buchanan, at seven.

Eye, (Waltonian Lectures): Dr. Mackenzie, at six.

Royal Infirmary, visit at two.

Clinical Lectures, at three.

Fees for each class, £3 3s., with the following exceptions:—

Practical Anatomy, six months, (when taken along with Lectures on Anatomy.) Practical Chemistry, three months, and

Lectures on the Eye, each £2 2s.; Analytical Chemistry, £4 4s. for three months, including apparatus and re-agents.

ROYAL INFIRMARY.—Hour of visit by the physicians and

surgeons, two o'clock. Hour of the clinical lectures, three o'clock. Fee for two years and perpetual, £8 8s.; for one year, £5 5s. A deduction is made to those who have previously attended a hospital for eighteen months, and to those who hold a diploma.

**ENROLMENT.**—By the regulations of the Senate, every student must, at the beginning of the session, enrol his name at the library before entering into any class. Library fee for the winter session, 7s.; for the summer session, 3s. 6d.

**MATRICULATION.**—The matriculation of public students takes place on the 14th of November. Those only who are matriculated are members of comitia, or university meetings, and can vote at the election of Lord Rector, which takes place on the 15th of November.

**DEGREES IN MEDICINE AND SURGERY.**—The curriculum for the degree of Doctor of Medicine comprehends attendance during four winter sessions on the medical classes afterwards mentioned, at this or some other university, or at one of the schools of London or Dublin. One of these winter sessions must be at the University of Glasgow. The courses of instruction required are the following—viz.: Anatomy, Practical Anatomy, Chemistry, Institutes of Medicine, Materia Medica, Practice of Surgery, Practice of Medicine, Midwifery, each of six months' duration; Forensic Medicine, Botany, Practical Chemistry, each of three months' duration. Attendance on a general hospital, in which clinical instruction is given, two years.

The candidates, who must not be under twenty-one years of age, are required to lodge their certificates of age, character, and qualifications, and their Inaugural Essays, with the clerk of Senate on or before the 1st of March or the 10th of June for the two terms respectively.

The qualifications for the degree of Master in Surgery are the same as those for M.D.

The degrees are conferred at two periods of each year—viz., on the last Wednesday of April, and the first Wednesday of August. The examinations commence in the last week of March and June for the two terms respectively.

The fee for the degree of M.D. (including the government stamp of £10) is £25 3s. The fee for the degree of C.M. is £10 10s.

The Brisbane and Walton Bursaries may be held by students of Medicine attending the University of Glasgow; and the Hutchinson's, by a student in any Faculty.

#### ANDERSONIAN UNIVERSITY, GLASGOW.

The medical session commences on Tuesday, the 7th of November, 1854.

**Anatomy, Descriptive:** Dr. M. S. Buchanan and Dr. George Buchanan, at five.

**Anatomical Demonstrations:** Ditto, at one.

**Practical Anatomy:** Ditto, daily.

**Chemistry, and Practical Chemistry:** Dr. F. Penny, at ten and eleven. Laboratory Manipulation, daily.

**Surgery:** Dr. R. Hunter, at nine.

**Institutes of Medicine:** Dr. E. Watson, at ten.

**Midwifery:** Dr. Paterson, at eleven.

**Medicine:** Dr. Andrew Anderson, at twelve.

**Materia Medica:** Dr. Easton, at four.

**Medical Jurisprudence:** Dr. Crawford, at six.

**Natural Philosophy:** Dr. Taylor, at eleven A.M.

**Mathematics:** Mr. Laing, at two or six.

**Botany:** Dr. Bell, in summer.

**Royal Infirmary visit,** at two.

**Clinical Lectures,** at three.

All the classes (except Practical Chemistry and Botany) meet for six months. Fees for each class, £2 2s.; perpetual, £3 3s. Royal Infirmary, perpetual, with Clinical Lectures, £8 8s. Eye Infirmary, £2 2s. for six months. Lying-in Hospital, 10s. 6d. for six months. Dressers to the surgical wards of the infirmary are appointed from the students attending.

**SUMMER SESSION, during May, June, and July:—**

**Midwifery:** Dr. Paterson, at ten.

**Practical Chemistry:** Dr. Penny, at twelve.

**Anatomy, Demonstrative and Surgical:** Dr. M. S. Buchanan and Dr. George Buchanan, at one.

**Botany:** Dr. Joseph Bell, at eight A.M.

Fee for each class, £2 2s.; aggregate fee for all the classes and hospital practice required by the College and Hall, £40.

Certificates of attendance on the above courses are received by all the licensing bodies in England and Ireland, by the Universities of Aberdeen and St. Andrew's, by the Royal College of Surgeons, Edinburgh, and by the Faculty of Physicians and Surgeons of Glasgow.

#### FACULTY OF PHYSICIANS AND SURGEONS, GLASGOW.

**PRELIMINARY INSTRUCTION.**—Every candidate for the diploma of this Faculty must produce evidence of his having attained the age of twenty-one years. He must, either previously to or during his medical education, have received regular instruction in Latin and Mathematics; and must have subsequently attended a course of Natural Philosophy of at least three months' duration.

**PROFESSIONAL INSTRUCTION.**—The candidate must have been engaged in attending the following separate and distinct courses of lectures during a period of not less than twenty-seven months, in which must have been included three winter sessions of six months' duration each:—

Anatomy, Practical Anatomy, and Surgery, of each two courses of six months, (or Surgery and Military Surgery, one course of six months each;) Chemistry, one course of six months; Practical Chemistry, one course of three months; Institutes of Medicine, Practice of Medicine, Materia Medica, Midwifery and Diseases of Women and Children, and Medical Jurisprudence, one course of six months each; Clinical Medicine and Clinical Surgery, two courses of three months each; Botany, one course of three months; General Hospital, with at least eighty beds, twenty-one months; Practical Pharmacy, six months.

The Faculty recommend the following—viz.:—

Lectures on the Eye, and Hospital for Eye Diseases. (A three months' course of lectures on the Eye, with six months' attendance on an Eye Hospital containing at least twelve beds for operation-cases, will be considered equivalent to three months of a General Hospital.) Lying-in Hospital. Hospital for Syphilitic Diseases. Pathological Anatomy. Natural History and Comparative Anatomy. Greek, French, German, and Italian.

Each candidate shall be examined, partly orally, and partly by written question and answer, without the use of books. He shall translate Latin, write prescriptions, and be examined in preparations.

The Committee of Examiners being satisfied with these trials, the candidate shall be entitled to his diploma, on taking and subscribing the declaration authorized by law, in place of extra-judicial oaths.

The unsuccessful candidates shall be remitted to their studies for a period of not less than three months after a first rejection, and six months after a second, and their names shall be concealed. The whole of the deposited fee shall be returned to an unsuccessful candidate on his first rejection; but on every future similar occasion, whether the examination may have been before the Faculty, or any other licensing board, or when the candidate, prior to application for a surgical licence, may have been five years in practice, two guineas shall be retained.

The Faculty register is open during the month of November, for the signatures of those students who wish to obtain the diploma, and the classes attended by each during the current session.

An examination in Latin will be held on the second and following Saturdays in December.

The regulation examination days are the first and third Tuesdays in each month.

The fee for the diploma is £10.

#### ROYAL INFIRMARY, GLASGOW.

**Physicians**—Dr. Easton, Dr. Bell, Dr. M'Gregor, Dr. Weir.  
**Surgeons**—Dr. Hunter, Dr. Fleming, Mr. W. Lyon, Dr. Corbett.

The clinical lectures on the medical cases will be delivered by Dr. Easton and Dr. Bell.

The surgical clinical lectures will be delivered by Dr. Hunter and Dr. Fleming.

Perpetual fee for attendance on the medical and surgical practice, and on all the lectures, £8 8s.

## EYE INFIRMARY, GLASGOW.

*Surgeons*—Dr. Wm. Mackenzie, Dr. Andrew Anderson.  
*Assistant-Surgeon*—Dr. Wm. Brown.  
*Consulting Surgeon*—Dr. Harry Rainy.

Hour of visit and operation, one P.M.  
 Fee for six months, £2 2s.

## UNIVERSITY AND KING'S COLLEGE, ABERDEEN.

*Chancellor*—The Earl of Aberdeen.  
*Lord Rector*—The Earl of Ellesmere.  
*Principal*—  
*Sub-Principal*—David Thomson, M.A.  
*Secretary*—George Ferguson, A.M.

REGULATIONS TO BE OBSERVED IN GRANTING DEGREES IN MEDICINE.—I. Candidates for the degree of M.D. must be of the age of twenty-one years complete, previous to examination.

II. Candidates must produce satisfactory certificates of moral character, and of having studied the classics and mathematics at an university, or at an academy of acknowledged reputation.

III. All candidates, with the exceptions mentioned below, must have been engaged in the study of Medicine for at least four years—one of which must be passed at King's College, Aberdeen—and must produce evidence of having attended, in some recognised school of medicine:—

Six Months' Courses: Anatomy, two courses; Chemistry, one course; Materia Medica, one course; Surgery, one course; Institutes of Medicine and Physiology, one course; Practice of Medicine, one course; Midwifery, one course.

Three Months' Courses: Dissections, two courses; Practical Chemistry, one course; Medical Jurisprudence, one course; Clinical Surgery, one course; Botany, one course; Clinical Medicine, two courses.

In addition to the above, every candidate must have attended for two years the wards of an hospital containing 100 beds; and during three months, a shop or dispensary for the compounding of medicines.

Previous to commencing the medical examination, candidates not having the degree of A.M. will be required to translate a passage from Celsus.

IV. The preceding regulations will be strictly enforced in the case of all students who commenced their medical studies at a period subsequent to the 1st of October, 1840. But practitioners who possess a licence or diploma from any of the Royal Colleges of Physicians or Surgeons, or from the Apothecaries' Company, and who have been engaged for at least five years in the practice of Medicine, will be admitted to examination on producing their licence or diploma, along with satisfactory evidence of good moral character, and of having studied the classics at an university, or at an academy of acknowledged reputation.

V. Practitioners who commenced their medical studies before October, 1840, and who have not been in practice for five years, will be admitted to examination under the conditions prescribed in Section III. and in Section IV., with the exception of a year's residence at King's College. Fees, £26 5s. 6d.

N.B. "The University and King's College is the only institution in Aberdeen which has a legal power of granting degrees in Medicine. All medical diplomas purporting to be from the University of Aberdeen, and not signed by the principal and professors of King's College, are illegal and void."—*Extract from Official Prospectus of King's College.*

## WINTER SESSION.

Introductory Lecture on the first Monday of November, at two o'clock P.M.

Midwifery: Dr. Rainy, at eight. Fee, £3 3s.  
 Anatomical Demonstrations: Dr. Redfern, at nine. £2 2s.  
 Chemistry: Dr. Fyfe, at a quarter to eleven. £3 5s. 6d.  
 Materia Medica: Dr. Templeton, at twelve. £3 3s.  
 Practice of Medicine: Dr. Williamson, at one. £3 3s.  
 Anatomy and Physiology: Dr. Redfern, at two. £3 3s.  
 Surgery: Dr. Kerr, at three. £3 3s.  
 Institutes of Medicine, (Physiology:) Dr. Christie, at four. £3 3s.

## SUMMER SESSION.

Botany: Rev. J. C. Brown, at eight. £2 2s.  
 Practical Chemistry: Dr. Fyfe, at twelve. £3 5s. 6d.  
 Anatomical Demonstrations: Dr. Redfern, at two. £2 2s.

Medical Jurisprudence: Dr. Reid, at three. £2 2s.  
 Histology: Dr. Redfern.  
 Natural Philosophy: David Thomson, M.A. £2 2s.  
 Natural History: Rev. J. Longmuir.

The rooms for practical anatomy are personally superintended by Dr. Redfern.

Students are required to matriculate within the first month of the winter session, and within the first fortnight of the summer session, and no certificate of attendance will be given without such matriculation. The matriculation fee for all the classes is one sum of 5s.

THE ROYAL INFIRMARY contains upwards of 300 beds. Separate courses on Clinical Medicine and Clinical Surgery are delivered there three times a week.

*Physicians*—Dr. Dyce, Dr. Kilgour, Dr. W. Williamson, Dr. Nicol.

*Surgeons*—Mr. W. Keith, Mr. W. Pirrie, Mr. David Kerr, Mr. A. J. Lizars.

*Ophthalmic Surgeon*—Mr. John Cadenhead.

Lectures on Clinical Medicine and Surgery by Dr. Kilgour, and Mr. W. Keith.

Fee for the medical and surgical practice of the hospital, first year, £3 3s.; second year, making perpetual, £3 3s.; or one sum of £5 5s.

Clinical medicine, for each of the three first courses, £1 1s., making perpetual; or one payment of £2 2s., perpetual.

Clinical surgery, for each of the three first courses, £1 1s., making perpetual; or one payment of £2 2s., perpetual.

DISPENSARY.—The Aberdeen General Dispensary, Vaccine, and Lying-in Institution, is open to the student on application to the medical officers. There are annually about 5000 patients, either prescribed for at the institution or visited at their own houses.

LUNATIC ASYLUM.—The Asylum contains about 240 patients. A limited number of students are admitted to see the practice. Fee, for a course of three months, £1 1s.

*Consulting-Physician*—Dr. Macrobis.

*Resident Physician and Superintendent*—Dr. R. Jamieson.

## MARISCHAL COLLEGE AND UNIVERSITY, ABERDEEN.

*Chancellor*—The Duke of Richmond.

*Rector*—Col. W. Sykes.

*Dean of Faculty*—Alex. Thomson, Esq., of Banchory.

*Principal*—The Very Rev. D. Dewar.

## REGULATIONS FOR GRANTING MEDICAL DEGREES.

*Curriculum*.—Four years of attendance on medical classes, of which two years may be passed at a recognised medical school; but two in an university, and one at least in this University. The attendance in each year must embrace not fewer than two medical classes of six months each, or one of six months, with two of three months each. The attendance must include the following classes, each for a course of six months:—Anatomy, Practical Anatomy, Chemistry, Materia Medica, Institutes of Medicine, Practice of Medicine, Surgery, Midwifery; and the following classes, each for a course of three months:—Botany, Practical Chemistry, Medical Jurisprudence.

Every candidate must produce a certificate that he has dissected all the parts of the human body.

Eighteen months of attendance on the medical and surgical practice of an hospital containing not fewer than eighty beds, along with attendance for six months on lectures on Clinical Medicine, and for three months on lectures on Clinical Surgery.

Six months of compounding and dispensing medicines in the laboratory of an hospital, or of a public dispensary, or of a licensed general practitioner, or of a regular dispensing druggist.

*Examinations*.—Examination terms in each year commence on the second Tuesday of April, and the third Tuesday of October.

Every candidate who is not a Master of Arts, nor possessed of a diploma or a licence in Medicine or in Surgery from any authority established by law within the United Kingdom, shall undergo a preliminary examination on the Latin language, (the book to be used being Celsus de Medicina;) on the Etymology of such Terms in the Medical Sciences as are derived from the Latin and the Greek; and on the Elements of Mental Science, (the book to be used being Abercrombie on the Intellectual Powers.)

Every candidate shall undergo two separate professional ex-

aminations. First examination: Anatomy, Physiology, Botany, Chemistry, Materia Medica. Second examination: Medical Jurisprudence, Midwifery, Surgery, Practice of Medicine.

Physiology will comprehend the Doctrines of Physic, illustrative of Animal Structure and Function.

No longer interval than two years will be allowed to intervene between the two examinations.

*Cases in which Medical Practitioners may be admitted, without residence, to Examination for Medical Degrees*—Practitioners may be admitted, without residence, to examination for the degree of M.B. who have held a diploma or a licence in Medicine or in Surgery, for at least five years, and who produce satisfactory evidence of good moral character, and of having been engaged in practice during that period.

Practitioners may be admitted, without residence, to examination for the degree of M.D., who have held a diploma or a licence in Medicine or in Surgery for at least ten years, &c.

Practitioners who have held, for at least three years, the degree of M.B., obtained without residence, may receive the degree of M.D. upon producing satisfactory evidence of good moral character, and of having been engaged in practice during their possession of the inferior degree.

*Conferring of Degrees.*—The degree of Bachelor of Medicine may be conferred on any candidate who has passed the prescribed examinations. Fee, £16 5s.

The degree of Doctor of Medicine may be conferred on any candidate, after passing the prescribed examinations, who is twenty-two years of age, or on any candidate who has been at least twelve months a Bachelor of Medicine of this University, after residing therein. Fee, £26 5s.

Graduates who have attended the several medical classes in this University will be charged no graduation fees.

#### FACULTY OF MEDICINE.

##### WINTER SESSION, COMMENCING NOVEMBER 6TH, 1864.

Anatomy: Professor A. J. Lizars, at twelve. Fee, £3 3s.  
 Practical Anatomy and Anatomical Demonstrations: Professor A. J. Lizars and Dr. Beveridge, at two. £2 2s.  
 Chemistry: Dr. Clark and Mr. Brazier, (assistant,) at three. £3 3s.  
 Practical Chemistry: Dr. Clark and Mr. Brazier, at eleven. £3 3s.  
 Materia Medica: Dr. Henderson, at nine. £3 3s.  
 Institutes of Medicine: Dr. Ogilvie, at four. £3 3s.  
 Practice of Medicine: Dr. Macrobain, at three. £3 3s.  
 Surgery: Professor Pirrie, at one. £3 3s.  
 Midwifery, and Diseases of Women and Children: Dr. Dyce, at four. £3 3s.  
 Natural History: Dr. Nicol, at eleven. £3 3s.

Janitor's fee for each of the above classes, 2s. 6d. No other fees are charged.

##### SUMMER SESSION.

Botany: —, at eight. £2 2s.  
 Practical Anatomy and Demonstrations: Professor A. J. Lizars and Dr. Beveridge, at twelve. £2 2s.  
 Medical Jurisprudence: Dr. Ogston, at nine. £2 2s.  
 Dietetics and Hygiene: Dr. Henderson, at one. £2 2s.  
 Hospital Practice and Clinical Lectures at Glasgow Royal Infirmary.

The various courses delivered in this University qualify for examination here, and at the Universities of London, Dublin, Oxford, Cambridge, Glasgow, and St. Andrew's; the Royal Colleges of Surgeons of England, Edinburgh, and Ireland; the Apothecaries' Hall, London; and the Medical Boards of the Army and Navy, and Hon. East India Company.

#### UNIVERSITY OF ST. ANDREW'S.

##### REGULATIONS FOR THE DEGREE OF DOCTOR OF MEDICINE.

I. Every candidate for a diploma in Medicine, upon presenting himself for examination, shall produce satisfactory evidence—

1. Of unexceptionable moral character.
2. Of having had a liberal and classical education.
3. Of having completed the twenty-first year of his age.

II. Fellows, Members, and Licentiates of the Royal Colleges of Surgeons of England, Edinburgh, and Dublin; of the Royal College of Physicians of London; of the Faculty of Physicians and Surgeons of Glasgow; and of the London Apothecaries' Company, are eligible as candidates for the degree of Doctor of Medicine, on producing their diploma or licence.

III. Candidates not holding any of the qualifications

enumerated in the above clause must produce satisfactory proof that they have regularly attended lectures delivered by professors in some university, or by Fellows of the Royal Colleges of Physicians or Surgeons of London, Edinburgh, or Dublin, for four complete winter sessions, or for three winter and three summer sessions, on the following branches:—Anatomy, two courses of six months each; Practical Anatomy or Dissections, twelve months; Physiology, one course of six months; Chemistry, one course of six months; Practical Chemistry, one course of three months; Materia Medica and Pharmacy, one course of three months; Midwifery and Diseases of Women and Children, one course of three months; Surgery, one course of six months; Clinical Surgery, one course of six months; Practice of Medicine, one course of six months; Clinical Medicine, one course of six months;—and that they have diligently attended for at least two entire years the medical practice in some public hospital in Great Britain or Ireland, containing not less than one hundred beds, and having a regular establishment of physicians, as well as surgeons.

##### REGULATIONS RESPECTING THE EXAMINATIONS.

*Examiners for Degrees in Medicine*—Dr. George E. Day, Mr. Arthur Connell, and Dr. William Piper.  
*Assistant Examiner*—Dr. Andrew Anderson.

The examinations take place twice in the year, commencing on the first Wednesday in May, and the third Wednesday in October. The graduation fee is twenty-five guineas. In the event of a candidate being found unqualified, he shall forfeit five pounds of the graduation fee, which, however, will be accounted for to him when he passes his examination at a subsequent trial.

Candidates can only be admitted to examination at other periods by a special grace of the Senatus Academicus. The graduation fee in this case is fifty guineas.

The examination extends over two days, and is conducted partly in writing and partly orally.

On the first day, candidates are required to give a written translation of a passage from a Latin medical author, and are examined in the Elements of Chemistry, in Materia Medica, and in Anatomy and Physiology.

On the second day, they are examined in Pathology and the Practice of Medicine, in the Principles of Surgery, and in Midwifery.

The degree is conferred on the following morning by the Rector, in the hall of the public library of the University, and the diplomas are signed by the Principals and Professors of the University.

Every candidate is required to present himself for registration to the Secretary on or before the day preceding the examination, and to communicate by letter with the Professor of Medicine, at least a fortnight previously, stating what diploma or certificates he intends to produce.

#### THE QUEEN'S UNIVERSITY IN IRELAND.

##### REGULATIONS TO TAKE EFFECT FROM THE 1ST OF OCTOBER, 1852.

Every candidate for the degree of M.D. shall produce a certificate from the Council of one of the Queen's Colleges that he has passed a full examination in the subjects of study prescribed in the course of matriculation for Arts, and has been admitted a matriculated student of the College in the Faculty of Medicine.

The curriculum shall extend over a period of at least four years, and shall be divided into two periods of at least two years each.

The first period shall comprise the following lectures:—Chemistry, Botany, and Zoology, Anatomy and Physiology, Practical Anatomy, Materia Medica and Pharmacy, six months each.

The second period shall comprise the following:—Anatomy and Physiology, Practical Anatomy, Theory and Practice of Surgery, Midwifery and Diseases of Women and Children, Theory and Practice of Medicine, six months each; Medical Jurisprudence, three months.

In addition to the above courses of lectures, candidates shall have attended during the first period of the above curriculum—Practical Chemistry, three months; Medico-Chirurgical Hospital, containing at least sixty beds, with Clinical Lectures, six months.

And during the second period—Practical Midwifery, six months; Practical Pharmacy, three months; Medico-Chirurgical Hospital, with Clinical Lectures, eighteen months.

Candidates, before being admitted to the degree of M.D., shall pass two examinations: the first examination comprising the subjects of the first period of the curriculum; the second comprehending subjects of the second period of study. It shall be competent for students to present themselves for their first examination at the termination of the first period of the curriculum, or at any after-period to be fixed by the Senate previous to their undergoing the second examination.

By the charter of the Queen's University, candidates are required to have attended at least one-third of the courses of medical lectures in some one of the Queen's Colleges. For the remainder of the courses of medical lectures, authenticated certificates will be received from the professors or lecturers in universities, colleges, or schools recognised by the Senate of the Queen's University in Ireland.

Candidates will also be required to have attended in some one of the Queen's Colleges, Lectures on one Modern Language for six months, and Lectures on Natural Philosophy for six months.\*

The examinations will be conducted principally by printed papers, to which written answers shall be given; but the examiners shall also be at liberty to add such *visd voce* examinations on the subject of the written paper, and to call for such demonstrations and experiments as they may deem necessary.

The above regulations will be binding on all students commencing their medical studies on or after the 1st of October, 1853; but students already engaged in their medical studies are at liberty either to complete their courses according to the ordinance of the 30th of June, 1850, or according to the present ordinance.

#### EXAMINERS FOR THE YEAR.

Chemistry: Dr. Edmund Ronalds.  
Anatomy and Physiology: Dr. Charles Croker King.  
Medicine: Dr. John Banks.  
Surgery: Dr. James S. Hughes.  
Materia Medica, Pharmacy, and Medical Jurisprudence: Dr. Aquila Smith.  
Midwifery, and Diseases of Women and Children: Dr. Henry L. Dwyer.  
Zoology and Botany: Dr. George Dickie.

#### QUEEN'S COLLEGE, CORK.

*President*—Sir Robert Kane, M.D., F.R.S., M.R.I.A.  
*Vice-President*—John Ryall, LL.D.

#### FACULTY OF MEDICINE.

*Dean of Faculty*—Alexander Fleming, M.D.

Anatomy and Physiology, and Practical Anatomy: Dr. Joseph Corbett.  
Practice of Medicine: Dr. D. C. O'Connor.  
Practice of Surgery: Dr. Dennis B. Bullen.  
Materia Medica: Dr. Alexander Fleming.  
Midwifery: Dr. J. R. Harvey.  
Natural Philosophy: Dr. Geo. Fred. Shaw.  
Chemistry and Practical Chemistry: Dr. J. Blyth.  
Natural History and Botany: Mr. Wyville Thompson.  
Modern Languages: Mr. R. De Vericour.

Clinical Medicine and Clinical Surgery, at the North and South Infirmarys, by the Physicians and Surgeons of these institutions. Clinical Midwifery, at the Lying-in Hospital.

**MATRICULATION.**—On Tuesday, the 17th of October, a matriculation, or entrance examination, will be held for students in Medicine. Candidates for entrance are required to send in their names to the registrar on or before Friday, the 14th of October.

The medical session will be opened on Tuesday, the 31st of October, at one o'clock, by an address from the Dean.

**FEES.**—The expenses of the College having been provided by public grants, in future the fee on matriculation and first year will be ten shillings; second, third, and fourth years, five shillings each year.

**CLASS FEES.**—Anatomy and Physiology, £3; each subsequent course, £2; Comparative Anatomy, £1 10s.; Practical Anatomy, £3; Practical Chemistry, £3; Natural Philosophy, £1 10s.; Botany, £1 10s. For all the other classes—first course, £2; each subsequent course, £1.

**SCHOLARSHIPS.**—The examinations for scholarships will commence on Tuesday, the 17th of October. In the session 1854-5, and in all subsequent years, eight scholarships will be awarded to students in Medicine, thus:—Six junior scholarships

of £20 each, to students commencing their first, second, and third years, (two to each year); and two senior scholarships, of £40 each, to students commencing their fourth year. The scholarships are tenable for one year only, but the scholars of each year are eligible at its expiration to the scholarships of the succeeding year. The scholar must attend, during the year of his appointment, the classes recommended for his year of study in the order of the curriculum. A scholarship of the same year in the same faculty cannot be held twice by the same student. The scholarships of the first year are open to all students who have passed the matriculation examination. Those of the second, third, and fourth years are open to all students who have passed the examinations and attended the lectures prescribed in the preceding part of the course. Two scholarships will be awarded to students of the first year: one for proficiency in literature; the other for proficiency in science.

#### QUEEN'S COLLEGE, BELFAST.

[The regulations, scholarships, &c., are precisely alike in each of the colleges.]

*President*—Rev. P. Shulldham Henry, D.D.

*Vice-President*—Dr. Thos. Andrews.

#### COURSES OF SIX MONTHS.

Anatomy and Physiology: Dr. Hugh Carlile.  
Practical Anatomy, under the superintendence of the Professor of Anatomy and Physiology, the Demonstrator of Anatomy, and Mr. H. Shaw, Anatomical Assistant.  
Anatomical Demonstrations: Dr. Henry Murney.  
Practice of Surgery: Dr. Alexander Gordon.  
Practice of Medicine: Dr. John C. Ferguson.  
Materia Medica: Dr. Horatio Stewart.  
Midwifery: Dr. William Burden.  
Chemistry and Practical Chemistry: Dr. Thomas Andrews.  
Botany: Dr. George Dickie.  
Medical Jurisprudence: Dr. John F. Hodges.

No student will be allowed to enter for any of the foregoing courses later than the 24th of November.

#### COURSE OF THREE MONTHS.

Practical Chemistry, under the superintendence of the Professor of Chemistry.

**LABORATORY PUPILS.**—The laboratory is open on five days in each week, during the College session, from ten till four, for practical instruction in chemical manipulation and analysis, under the direction of the professor of chemistry and his assistant. Fee for working six months, £10; one month, £3.

#### KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.

*Visitors*—The Lord High Chancellor of Ireland, the Lord Chief Justice of the Queen's Bench, the Lord Chief Justice of the Common Pleas, the Chief Baron of the Exchequer.

*President*—Dr. Evory Kennedy.

*Vice-President*—Dr. Thomas Brady.

*Censors*—Drs. Thomas Brady, James Foulis Duncan, William Barker, — Lees.

*Treasurer*—Dr. John Mollan.

*Registrar*—Dr. W. E. Steele.

*Librarian*—Dr. G. A. Kennedy.

*Professor of Midwifery*—Dr. W. F. Montgomery.

*Professor of Medical Jurisprudence*—Dr. Thomas Brady.

*Examiners in Midwifery*—W. O'Brien Adams, Henry Law Dwyer, Fleetwood Churchill.

*Inspectors of Apothecaries' Shops*—The Censors.

(Officers elected October 19th, 1853.)

Physicians practising in Dublin, and within seven miles thereof, and those attached to county infirmaries and prisons in Ireland, are required by the charter and statutes to possess the licence of the College.

Candidates for the licence who have completed the following course of education are admissible to examination:—Anatomy, Chemistry, Practice of Medicine, Materia Medica, Institutes of Medicine and Midwifery, Demonstrations and Dissections, of each six months. Botany, Medical Jurisprudence, of each three months. Medico-Chirurgical Hospital, two years and a half; and Lying-in Hospital, six months.

Graduates in Medicine of any university in the United Kingdom, and surgeons of four years' standing or upwards, are admissible to examination on producing their diplomas.

\* Candidates will of course be examined in these subjects.

Surgeons under four years' standing are required to have attended Botany, Institutes of Medicine, and a Lying-in Hospital.

Candidates are required to undergo two days' examination on the above subjects, except medical graduates and surgeons of seven years' standing, who are examined in the subjects of the second day only—viz., Practice of Medicine, Institutes of Medicine, and Midwifery.

Surgeons who are A.R.'s, in addition to these subjects, are examined also in Botany and Materia Medica.

Members of any Apothecaries' Company are ineligible for admission to the licence.

Licentiates of three years' standing, who are graduates of the Universities of Oxford, Cambridge, or Dublin, are alone eligible for election to the Fellowship.

Fee for the licence, £30; stamp duty, £15.

Fee for the fellowship, £20; stamp duty, £25.

## ROYAL COLLEGE OF SURGEONS, IRELAND.

*President*—Charles Benson.

*Vice-President*—Sir Philip Crampton, Bart.

*The Council*—Alexander Read, Arthur Jacob, A. Ellis, R. C. Williams, R. Adams, J. Barker, W. Colles, J. H. Power, Edward Hutton, J. Macdonnell, H. Irvine, J. S. Hughes, Robert Pentland, Robert Mayne, Richard G. H. Butcher, Augustus E. Tabuteau, Samuel G. Wilmot.

*Honorary Secretary of the College*—Edward Hutton.

*Secretary of the Council*—Henry Maunsell.

*Court of Examiners*—T. Rumley, C. Fleming, O'Brien Bellingham, R. Tuohill, Thomas Byrne, Francis Battersby, M. H. Stapleton.

*Examiners in Midwifery*—W. Jameson, Alfred M'Cintock, Samuel L. Hardy.

### PROFESSORS.

Anatomy and Physiology: Dr. Arthur Jacob.

Descriptive Anatomy: Dr. J. H. Power and Dr. Bevan.

Surgery: Mr. H. Porter and Mr. W. Hargrave.

Medicine: Dr. C. Benson.

Chemistry: Dr. W. Barker.

Materia Medica: Dr. R. C. Williams.

Midwifery: Dr. T. Beatty.

Medical Jurisprudence: Dr. T. P. Geoghegan.

Botany: Dr. A. Mitchell.

Practical Chemistry: Dr. Barker.

Comparative Anatomy: Dr. Jacob.

Logical Science: Dr. John Murray.

Dissections under the direction of the professors of Anatomy, assisted by the demonstrators, Messrs. Hargrave, Malcolmson, Morgan, and Mapother.

The fee for each of the above courses is £2 2s.

Fellows of the College are members of the Corporation, and are admitted by examination; letters testimonials are granted to Licentiates, and a diploma in midwifery to Fellows and Licentiates educated and examined in that branch of surgery.

*Candidates for the Fellowship* must be twenty-five years of age, and must give proof of liberal preliminary education, and good conduct during professional education. They are required to produce certificates of surgical studies for six years, (three of which must be for exercises in Dublin,) and also of practice as house-surgeon or dresser in an hospital; as well as certificates of attendance on hospitals, lectures, and dissections, as required from Licentiates; with the addition of Botany, Comparative Anatomy, and Natural Philosophy. Fee, £26 5s.; if the candidate be a Licentiate, £10 10s.

*Candidates for Letters Testimonial* are required to produce certificates of preliminary classical education, of four years' professional study, (three of them in metropolitan schools,) also three years' attendance on hospital lectures and dissections. Fee, £21.

*Candidates for the Midwifery Diploma* must be Fellows or Licentiates of the College, are required to produce certificates of attendance on midwifery lectures and practice, with proof of having attended thirty cases of parturition.

*Candidates for the Fellowship and Letters Testimonial* are publicly examined on two separate days, in Anatomy, Physiology, Surgery, Practice of Medicine, and Pharmacy. The examiners are elected by a sworn jury of the Council appointed by lot, teachers being ineligible. Fellows and Licentiates of the College are qualified to practise as surgeons in any part of the British dominions, and to be appointed medical officers to the army and navy, public hospitals, infirmaries, dispensaries, and workhouses.

## CITY OF DUBLIN HOSPITAL.

The course of practical, medical, and surgical instruction in this hospital will commence on the 2nd of October, 1854.

The Clinical Lectures will be delivered on three days in each week, during the session, by Dr. Jacob, Dr. Benson, Mr. Hargrave, Mr. Williams, Dr. Geoghegan, and Mr. Tufnell; and on Diseases peculiar to Women and Children by Dr. Beatty.

Dr. Jacob's Clinical Lectures on Diseases of the Eye, illustrated by the cases in the hospital, are open to the pupils in attendance.

*Consulting Surgeons*—Sir Henry Marsh, Sir Philip Crampton, Mr. Cusack, and Dr. Apjohn.

*DISEASES OF THE EYE*—Dr. Jacob will deliver a full course of Lectures on the Anatomy, Physiology, and Optical Mechanism of the Eye, during the ensuing session, in the College of Surgeons; and also a separate course on its Pathology and Diseases, with the Operations required in their Treatment, in the City of Dublin Hospital.

## APOTHECARIES' HALL OF IRELAND.

### LAWS REGARDING THE EDUCATION OF APOTHECARIES.

Every candidate must undergo two separate examinations, one for the certificate of apprenticeship, the other for the licence to practise.

Every candidate for the certificate of apprentice will be examined in the following books:—In Latin: the *Catiline War* of Sallust, and the first three books of the *Æneid* of Virgil. In Greek: the Gospel of St. John, and the first twenty Dialogues of Lucian, or the first two books of Homer's *Iliad*. In French: *Telemachus*, or the *History* of Charles XII. In Science: the first two books of Euclid, and Algebra to the end of simple equations.

Every candidate for the licence to practise as an apothecary must lay before the court,—the certificate of apprentice; the indenture of apprenticeship, enrolled according to the Act of Parliament, and bearing the certificate of the licentiate apothecary to whom he has been indentured, of a good moral character, and of having fulfilled the period of his apprenticeship; certificates, duly signed, that he has diligently attended at least one course of lectures on each of the following subjects delivered at the School of Apothecaries' Hall, or at some other school of medicine recognised by the Court:—Chemistry, Anatomy and Physiology, six months; Practical Chemistry,\* Botany and Natural History, three months; *Materia Medica*,† Demonstrations and Dissections, Theory and Practice of Physic, Surgery, Midwifery, and the Diseases of Women and Children, six months; Medical Jurisprudence, three months.

The order of study here laid down is recommended for the guidance of students.

Attendance for the entire period of eighteen months on the medical and surgical practice in an hospital or hospitals recognised by the Court.

Also, a certificate of having assisted in at least thirty cases of midwifery practice, twenty of which must be attended in a recognised hospital.

The examination for the licence to practise as an apothecary will be as follows:—In Chemistry and General Physics; Pharmacy, Theoretical and Practical; *Materia Medica* and Therapeutics; Natural History and Medical Botany; Anatomy and Physiology; the Theory and Practice of Medicine; Midwifery; Medical Jurisprudence.

Gentlemen who are graduates in Medicine of any of the British or Irish Universities, or who possess letters testimonials from any of the Royal Colleges of Surgeons in Great Britain or Ireland, will be admitted to examination for the licence of the Hall on producing proof of three years' legal apprenticeship to a qualified apothecary practising with open shop in Ireland, and of a professional education equal to the curriculum prescribed by the Council.

The Court of Examiners sits every Friday, at two o'clock. Candidates are required to lodge their testimonials a clear week before the day of examination.

A rejected candidate cannot be re-admitted to examination until the expiration of six months.

An examination of apothecaries' apprentices takes place at the Hall, on the first week in May, annually, upon some subject in Pharmaceutical or Pathological Analysis.

\* The Practical Chemistry must be attended in a laboratory, and no certificate will be received by the Court that does not testify that the candidate has prepared the several pharmacopœial preparations which are usually made in the laboratory.

† The *Materia Medica*, if attended in summer, must consist of two courses of three months' duration each.

## DUBLIN SCHOOL OF MEDICINE, PETER-STREET.

## WINTER SESSION.

Anatomy and Physiology : Dr. J. H. Sawyer and Dr. Edward Hamilton, daily, at one.  
 Practical Anatomy and Dissections : Dr. E. Hamilton and Dr. G. H. Kidd, daily, at eleven.  
 Theory and Practice of Surgery and Operative Surgery : Mr. Andrew Ellis, late President of the Royal College of Surgeons of Ireland, Tuesday, Thursday, and Saturday, at three.  
 Theory and Practice of Medicine : Dr. J. Moore Neligan, Monday, Wednesday and Friday, at twelve.  
 Midwifery and Diseases of Women and Children : Dr. John Ringland, Tuesday, Thursday, and Saturday, at twelve.  
 Chemistry : Dr. John Barker, Tuesday, Thursday, and Saturday, at two.

## SUMMER SESSION.

Materia Medica : Dr. Humphrey Minchin.  
 Botany : Dr. Christopher Asken.  
 Practical Chemistry : Dr. J. Barker.

The dissecting rooms, lighted with gas, for the accommodation of those who cannot attend during the day, are open from seven in the morning till ten at night, under the constant superintendence of the Lecturers on Anatomy and the Demonstrators. Dissections commence on the 1st of October.

## A CASE IN WHICH LOCAL ANÆSTHESIA WAS EMPLOYED IN AN OPERATION ON THE EYE.

By GEORGE CRITCHETT, Esq., F.R.C.S.,

SURGEON TO THE ROYAL LONDON OPHTHALMIC HOSPITAL; SENIOR ASSISTANT-SURGEON TO THE LONDON HOSPITAL, ETC.

As the following case is, I believe, the first example of the employment of Dr. Arnott's ingenious suggestion in operations upon the eye, and as it presents some other points of interest, I am anxious to bring it before the notice of the profession.

I was requested by my friend, Mr. Hovell, of Clapton, to meet him in consultation, together with my friend and colleague, Mr. Dixon, in the case of a gentleman, somewhat past the middle period of life, who had recently come up from the country to place himself under Mr. Hovell's care, on account of severe, painful, and protracted disease of the right globe. It appeared, from the history of the case, that the disease had commenced very insidiously about two years ago, attacking first the inner surface of the cornea, spreading to the iris, and then by degrees involving the choroid, retina, and humours, producing secondary cataract, and entirely destroying vision. All these serious results took place without any acute symptoms, and with very slight pain, and in spite of mercury and other active measures. Things remained in this condition for several months, without any obvious change, when suddenly, about six weeks previous to our seeing him, he was attacked with symptoms of acute inflammation of the globe, attended with intense pain of a paroxysmal and intermittent character, and radiating from its source along the branches of the fifth pair of nerves. Our patient described this pain as being almost unbearable when at its *acmé*, as resisting all ordinary means of relief, and as subsiding only to renew itself with increased force. On examining the globe, the vessels were found to be in a state of extreme congestion, the pupil was widely dilated, and a hard cataract could be seen thrust forward, pressing upon the iris, and nearly in contact with the cornea; the globe felt very hard, and was extremely tender to the touch. It was quite evident that these symptoms were due to tension of the globe, caused by abnormal accumulation of fluid within its dense, unyielding, fibrous case, pressing the hard lens against the nerves of the iris, and thus involving the entire fifth pair of nerves. It was one of those cases which, if unrelieved, must either exhaust the powers of the patient, or find vent in the giving way of the cornea and sclerotic, and the occurrence of staphyloma. Seeing, then, that the eye was lost, that the lens was acting as a foreign body, that the globe was suffering from tension, and that no relief could be expected while this state of things lasted, the obvious suggestion that occurred to us was to make a section of the cornea, allow the lens and some of the vitreous humour to escape, and thus get rid of the cause of the suffering. There were, however, some serious and well-grounded objections to this proceeding; the highly inflamed state of the globe would render such an operation intensely

and almost unbearably painful, and the lengthened period during which the eye had been diseased, the enlarged state of the bloodvessels, and the extreme spasm of the muscles, would almost inevitably cause the humours to be suddenly forced out, and the vessels to give way, distending the globe with blood, occasioning hæmorrhage to a serious extent, and probably rousing up the old pain with increased severity. It is true that some of these objections might have been obviated by the use of chloroform, but it was deemed quite inexpedient to have recourse to general anæsthesia, because our patient had recently suffered from hemiplegia. It was suggested that it would be more desirable to wait until the eye subsided into a quiet state; but as this would have necessitated inconvenient delay, and as there was a liability at any moment to a severe relapse, our patient, when the "pros" and "cons" were fairly laid before him, determined to have the operation performed without loss of time. It then occurred to me that it would be a favourable case for the employment of local anæsthesia, with the threefold object of destroying the sensibility of the part, constricting the vessels to prevent hæmorrhage, and diminishing the liability to subsequent inflammation. With this view some pounded ice was put into a bladder, mixed with salt, and placed over the right eye, temple, cheek, and brow, and kept there for about twenty minutes. At the end of that time, all sensation being lost, I made a rapid section of the cornea, which was immediately followed by the cataract and some portion of vitreous humour. Some slight hæmorrhage occurred, but slowly, and not to an extent beyond half an ounce. As sensation returned, our patient complained of extreme soreness and discomfort about the eye, and some of the old pains, taking the course of the fifth pair of nerves, came on. All this, however, speedily subsided, and we had the satisfaction of seeing him in a few days quite free from pain, the section of the cornea gradually approximating, and with every prospect of a speedy and complete recovery, without fear of relapse, now that the cause of all the suffering was removed.

It seems to me that the application of cold fulfilled, in this case, all the indications that were desired, and from the slight hæmorrhage that occurred, and from my previous experience of somewhat similar cases, I am of opinion that if the operation had been performed without local anæsthesia, there would have been very severe pain at the time, extensive bleeding, consequent painful distention of the globe, and a tedious recovery.

Finsbury-square, Sept. 1854.

## ON THE NATURE, CAUSE, AND TREATMENT OF CHOLERA.

By DAVID LEWIS, M.D.,

LICENTIATE OF THE ROYAL COLLEGE OF PHYSICIANS, LONDON; PHYSICIAN TO THE ROYAL GENERAL DISPENSARY, ALDERGATE-STREET.

In the midst of so many specifics for the cure of cholera, and such numerous theories to explain its cause, I venture to submit the following observations to notice with considerable diffidence. But I am emboldened to speak plainly, because, to the best of my belief, I speak the truth—a belief founded upon impartial observation, and confirmed by a lengthened experience. I have treated many hundreds of cases of diarrhoea according to most of the methods generally reported to succeed, and the result of my experience is, that two only of the various plans avail to cure—viz., the employment of alkalies, or the stronger acids. Both these plans appear to fail so seldom that I now invariably prescribe them with perfect confidence. But how can remedies, so opposed in all their characters, produce, when administered, similar effects? What is their action?

I believe the almost universal cause of diarrhoea to be an excess of acidity in the stomach and intestines, and I believe that alkalies act by neutralizing, and the mineral acids by destroying, this morbid condition. That diarrhoea is so generally caused by the presence of a morbid material, of an acid character, I think is proved by the following facts:—A gentleman of high standing in society partook heartily of some cherry-pie for supper; he was attacked with diarrhoea in the night, and died of cholera next day. Another gentleman being in delicate health, drank two glasses of champagne at dinner; he was attacked with diarrhoea in the night, and died of cholera in nine hours. Another man drank a quart of sour beer, was soon attacked with diarrhoea, and died of cholera in twelve hours.

# THE BRITISH MEDICAL DIRECTORY for 1855.

THE Editors of THE BRITISH MEDICAL DIRECTORY would feel grateful to the duly-qualified Practitioner who receives this Paper if he would kindly oblige them by filling up, or inducing others to fill up, the following Tabular Forms, and returning the same to them for insertion in the forthcoming DIRECTORY, at his earliest convenience.

The Editors solicit information as to the names of duly-qualified Medical Practitioners in the Towns, &c., (or, if in London, or other large places, in the street, &c.) in which they reside.

This yielded to four grains of the chloride of mercury in divided doses, and the appetite and digestive powers recovered, by the use of soda, hydrocyanic acid, and tincture of cinchona, in three or four days. Had he not been a strong healthy child, I am sure he would have sunk. I am not aware of the strength of Mr. Crew's fluid, but I should imagine it to be a concentrated solution from its great weight.

Harrow-road, 1854.

### Reviews and Notices of Books.

*Three Lectures on the Correlation of Psychology and Physiology.* Delivered in the Chatham-street School of Medicine. By DANIEL NOBLE, M.D., &c. London. 1854. pp. 45.

THE first of Dr. Noble's Lectures is taken up with general remarks on the "Physiology of the Brain and Nervous System;" the second considers "Emotional Sensibility, and its Reactions;" and the third treats of "Ideas, and their Dynamic Influence." As these Lectures have already appeared in print, we need not dwell upon them further than to intimate their publication in a separate form, and to recommend their perusal by all engaged in the investigation of the relations of specific portions of the nervous centres to particular intellectual or emotional manifestations.

*A Lecture on Respiration.* Being the sixth of a series of plain and simple Lectures on the Education of Man. By THOMAS HOPLBY. London. 1854. pp. 86.

THIS seems generally well adapted to its purpose, though exception might be taken to particular and paradoxical views in it—e. g.: "It has yet to be solved whether towns may not be rendered even more salubrious than the country."—p. 63. We should like to see the solution in the affirmative, as it does not often fall to our own lot to be able to exclaim—

"To-morrow to fresh fields and pastures new."

*Dissertatio Medica Inauguralis de Febre Flavâ a Contagione Vindicans, &c. &c., eruditorum examini subicit* GULIELMUS MCGEE. Edinburgi. 1828.

THOUGH bearing the date of 1828, we have but lately received Dr. McGee's thesis, through the medium of the Secretary of the Royal Geographical Society of London. We presume it is wished to place on record at the present moment, when so much argument is being carried on respecting the contagiousness of yellow fever—the early denial of its contagion by Dr. McGee, and also to point out where material will be found available to those who would support our author's view of the question. Knowing that useful information of an historic kind contained in inaugural dissertations is generally overlooked or forgotten, we will here place on record the author's opinion:—

"Ineunte jam anno 1820 ad Indiam occidentalem usque profectus sum: atque nullius theoriæ addictus observatione et experientia solis duci decreveram. Atque nunc post longam nec interruptam medicinæ inter tropicos exercitationem, palim profiteri nihil hæsit, nullam mihi unquam apparuisse causam cur febrim flavam contagiosam existimarem, nec eam sub quâlibet conditione contagiosam devenisse credo."—p. 16.

### Contemporary Medical Literature.

#### FOREIGN BODY IN THE OESOPHAGUS; OPERATION; RECOVERY.

SINGHO NAIDE, a native of Colombo, aged forty, a fisherman by occupation, was taken into the pettah Hospital on the evening of the 12th of August, 1853, a fish, which he held between his teeth while baiting a hook, having slipped back into, and remained impacted in, the oesophagus. On examining the neck, it appeared swollen, with a feeling as if there were fluid in the cellular tissue about the muscles of the neck. In the fauces the tail of the fish was felt, and could be seen distinctly on depressing the tongue. The tail was inclined towards the left side of the throat, showing the direction the

fish had taken in its course down the oesophagus. Careful examination externally failed in discovering the situation of the fish, and it was found impracticable to withdraw it from the throat for reasons which will appear obvious when the fish is described. An incision was made between the anterior edge of the sterno-mastoid muscle and the trachea, commencing at the lower edge of the os hyoides, and extending down to the sternum. After a most diligent search, both by myself and my friends, nothing was discovered to indicate the spot where the gullet should be divided. The next step of the operation was conducted with great care. The passing of a male catheter was entrusted to Dr. Elliott, who, with no little difficulty, introduced it into the gullet, directed by his fingers, and turned the convex side of it towards the wound. This enabled the part to be seized with a pair of forceps, and a small opening to be made into the oesophagus. The finger introduced into this opening gave the feeling of something cartilaginous being lodged, which was soon found to be the edge of the fish. A polypus forceps was introduced, and attempts were made to extract it, but to no purpose, as the head of the fish was too smooth to be grasped by a polished instrument. A little manoeuvre with the index-finger, however, soon dislodged the fish, which made its exit through the wound, head foremost. The fish was four inches and a half long from head to tail, and one inch and a half broad. It is named by Mr. Gray, in his "Illustrations of Indian Zoology," "Anabas Spinosus," and has long and sharp fins, both on the back and near the gills. About a week after the operation, a little nourishment was given through the mouth, but as some of it flowed out through the wound, it was deemed prudent not to repeat the attempt, but to continue nutriment through the rectum. In three or four days more the man was able to take nourishment by the mouth, from which time he began to gain flesh and strength. The wound healed gradually, and he was discharged quite cured on the 23rd of September, with merely a line of cicatrix on the side of the neck. The performance of the operation occupied more than an hour, and by lamplight.—Mr. P. D. ANTHONIESZ in *Ceylon Miscellany*, vol. i, No. 2.

#### POISON OF THE RATTLE-SNAKE.

There is good reason for the belief that its action is the same upon all living things, vegetables as well as animals. It is even just as fatal to the snake itself as to other animals, for Dr. Dearing informed me that one of his specimens, after being irritated and annoyed in its cage, in moving suddenly accidentally struck one of its fangs into its own body: it soon rolled over, and died as any other animal. Here then we have the remarkable, and perhaps unique fact, of a liquid secreted directly from the blood which proves deadly when introduced into the very source (the blood) from which it was derived.—Dr. BURKETT in *Pharmaceutical Journal*.

### THE MEDICAL EXAMINERS OF THE EAST INDIA COMPANY.

To the Editor of THE LANCET.

SIR,—Having so ably and warmly advocated, as you have lately done, the cause of the Indian Medical Service at large, myself and all others, who either belong or have belonged to that service, are truly obliged for the independence and generosity of your conduct in this matter, as the class to which I and others here belong feel ourselves completely without a voice in the public press of this country, and altogether without sympathy for our cause, or a just appreciation of long and laborious services by those who compose the councils of the nation. It is time, I think, that we should bestir ourselves, in order to obtain a better and more just recognition by English authorities of our past laborious and zealous professional services in a most unhealthy country and overpowering climate. The valuable Medical and Topographical Reports of the Diseases and Stations of the Madras Army, published under the superintendence of the Medical Board of that Presidency; the no less valuable Transactions of the Medical Societies of Calcutta and Bombay; the elaborate Medical Reports of Cholera at the several Presidencies; and those, also, of the Systems of Medical Education carried out in the various Indian Colleges, are all evidences of the highest order of talent and zeal to be met with in the Indian Medical Service, but which are altogether lost sight of in distributing rewards for merit in this country. Sir Charles Wood's late appointments virtually deny any such title of Indian medical officers to reward.

Cheltenham, September, 1854.

A RETIRED INDIAN SURGEON.

# THE LANCET.

LONDON: SATURDAY, SEPTEMBER 23, 1854.

ONCE more we would remind the profession that the President of the Board of Health has issued printed forms for the concise registration of cases of Cholera. Ere the present LANCET issues from the press those forms will most probably be in the hands of all the members of the medical profession in the kingdom. In the letter to medical practitioners which accompanies the papers, Sir BENJAMIN HALL announces, that in fulfilling the duties of his weighty and responsible office he is strongly impressed with—

“A sense of the great want that is now felt of some systematic record of cases of Choleraic disease, their treatment and results, with a view to determine, in so far as may be possible, the best mode of meeting this formidable epidemic.

“The deaths from Cholera, as well as from all other causes, are registered in England; but it is evidently desirable that in this as in other countries the cases of recovery, as well as those of death, should be systematically observed and recorded. But this can only be accomplished by the cordial co-operation of all the medical men in practice, which the Board hopes, in this important matter, to obtain, by acting on the advice of a Council in which all branches of the medical profession are represented.

“By means of a return, in the accompanying forms, the observations of all qualified practitioners on the cases that come under their care may be collected, and made available for determining the laws which regulate Choleraic disease, and the effects of the different systems of treatment now in use.”

Several sheets, adapted for the brief record of twenty cases each, accompany this letter, and specimens are also given showing the mode of filling up the returns, whether relative to cases of confirmed cholera, or of the diarrhoea which constitutes its premonitory stage.

“It is recommended that the forms should be filled up from day to day, and returned to the Board on or before the 15th of November next, addressed to the Secretary of the General Board of Health, and the postage of the letter enclosing the return need not be prepaid.”

We need scarcely at this time, while disease and death are rife around us, urge upon our medical brethren how much our knowledge of the best and most successful methods of combating cholera might be advanced, and how much benefit medical practitioners might confer upon the community, by promptly responding to the appeal of the President of the General Board of Health. The numerical method, and the statistical machinery of the Board, will be now brought into operation for determining “the effects of the different systems of treatment now in use.” By means of the forms now issued, and which will again be collected from every district throughout the length and breadth of the land, it will be ascertained, by a comparison of the cases on the largest scale, whether the treatment by sulphuric acid, soda, or astringents, is the most efficient in checking diarrhoea; whether calomel in small and repeated doses, sulphuric acid, stimulants, the enveloping the whole body in blankets carrying hot water and turpentine, or any other method that has been employed, is the best treatment for the terrific malady when it has reached the stage of collapse; and what means are to be preferred in the endeavour to remove the consecutive fever when the patient lies prostrate from the shock the system has received. The

returns, if carefully made, will also prove the average duration of the attacks, their termination in proportionate numbers, and in what the present invasion of the epidemic materially differs from those which have preceded it—all which statistical results ought to have an important effect in guiding medical practitioners as to the mode of defending human life against the inexorable pestilence—~~whenever~~—as there is too much reason to apprehend—it shall again visit these shores. No doubt the registration of cases will demand some share of time and attention on the part of each practitioner or his assistant, but appeals to the philanthropy of the medical profession are seldom made in vain; and we confidently trust that, considering the great importance of the object to be effected, medical practitioners will vie with each other as to who shall best contribute to aid the laudable designs of the General Board of Health, and thus aid in protecting human life against one of the deadliest foes of mankind.

In accordance with the scheme of our “Mirror of the London Practice of Medicine and Surgery,” we have lately gathered together the reports of the methods of treating Cholera pursued at all the hospitals and dispensaries in the metropolis. By this means we hope to aid the profession in arriving at some definite and successful course of practice. We are bound to acknowledge that the first and the most obvious lesson taught by the survey we have taken is, the melancholy one of our actual ignorance of the pathology of this dire disease, and the consequent fact, that all our methods of treatment, howsoever loudly some of them may be vaunted as rational, are, in truth, empirical, experimental, and tentative. Rash men, warm in imagination, deficient in judgment, here and there rush into a theory, fungoid, ærial, telluric, electrical, toxicological, monadic, according to accidents of observation and accidents of hobbyism, all having one common characteristic, that of being all equally arbitrary and incapable of demonstration. Prudent men, pursuing their calling in the spirit of humility befitting our ignorance, but zealously as becomes those who are intrusted with the tremendous charge of guarding, as far as in them lies, the public health, abstain from the inanities of theorizing, from epistolary quackery, from dogmatic recognitions of particular remedies as Cholera specifics. The medical practitioner has, at this moment, to stem a perfect torrent of nostrums; some the offspring of the silliest charlatanry and self-sufficiency; some of value attested not by reason, not by experience that will bear sifting, but upon oath or affirmation; some that have the testimony of careful and competent observers to recommend them: these last are few. Who shall give light out of the dense darkness? Alas, the efforts of those who are most competent to the task are almost overpowered by the ever-thickening cloud! Each new enthusiast shouting “Eureka!” thinks it was reserved for him to disperse the gloom: yet he has but contributed a fresh volume of smoke! One of the last little puffs of mystification thus raised is the poison-expelling castor oil hypothesis of Dr. GEORGE JOHNSON. According to this physician the pathological problem is solved; the therapeutical indication clear and certain. The profession is reproved for “blindly adhering to chalk, opium, and brandy;” and we are bidden to put a bandage over our eyes, and our trust in purgation and castor oil. This is the pathological discovery which the profession

called upon to hail as the last expression of science—the unerring guide to successful treatment:

“Some mysterious (no mystery to some who know all about it) poison enters the blood, which, while it exerts a powerful, depressing, and narcotic influence on the entire nervous system, in most cases excites a copious secretion into the stomach and intestines, whereby the poison is separated (?) from the blood and ejected from the body.” (Assume all this, take it for granted, and)—“what procedure so full of promise as that which has for its object to favour and assist the elimination of the poison?”

You have assumed your pathology; you cannot resist the therapeutical corollary. Therefore, half an ounce of castor oil every half-hour is the remedy for Cholera. Sincerely do we wish that experience would bear out the theory. But then, we are told that experience does bear out the theory. Fifteen cases of Cholera in the stage of collapse have been treated with castor oil, and twelve, it is said, have recovered. That is equal to a proportion of four-fifths, a greater than that known under any other mode of treatment. Shall we contumaciously resist evidence so conclusive, so unambiguous? Is not the experience, resting as it does upon the broad basis of fifteen cases, as solid and as unanswerable as the pathological assumption and the therapeutical corollary? We feel it our duty to caution the public—the profession knows too well the value of these *posts* and *propters*—against the delusion that castor oil is the remedy for Cholera. It may sound very well to say that there is a poison in the blood which castor oil will expel. But may we not conjecture that, assuming the presence of the poison, the flux from the bowels that sets in spontaneously is rapid enough to carry it off without the aid of purgatives? Shall we “bliadly” forget that this flux is rapidly draining the system of something else besides the hypothetical mysterious poison? That the life-blood is fast ebbing away, and if not arrested, the flux will leave so little blood, and that so inspissated from the loss of its watery element, that the circulation must stop? We submit that those practitioners who give opium with the view of arresting the flux of Cholera, in the stage of diarrhoea, act not thus “ignorantly.” We have no hesitation in saying that this practice is quite as scientific as the treatment by purgation with castor oil. In the first place, we are also entitled to doubt whether the cases treated in this hospital were really severe. Every practitioner of experience knows that the danger attending attacks of Cholera is by no means uniform. Many cases are hopeless from the first. Many recover. The difference lies often, perhaps for the most part, not in the treatment but in the disease itself. The first cases that occurred in the terrible outbreak in St. James’s were almost all fatal; no skill, no treatment availed. The latter cases were remarkably easy to manage; treatment—not by castor oil—was eminently successful.

The condemnation of castor oil and the system of purging, by the profession, is almost universal. Out of King’s College Hospital it has invariably failed. In the London and St. Thomas’s Hospitals it has been tried with the most fatal results. Mr. SUTHERLAND has fairly tried the plan in eight cases in the Cholera Hospital at Aberdeen, and seven patients died. He says: “In spite of the oil, ‘the very extremity of ‘collapse’ became deeper and deeper, until death snatched the ‘patient from a ruthless disease, and, I am afraid, an equally ‘ruthless and unscientific practice.’ ..... ‘The only effects ‘produced by the oil were increase of the vomiting and spasms.’” Dr. CHALLIS, of Bermondsey, a most experienced practitioner,

has also stated to the Registrar-General, as the result of observation, his conviction that the use of castor oil has been fatal in many cases. This is the experience of others. It is surely entitled to weigh against the fifteen cases of Dr. JOHNSON. In all the hospitals the castor oil treatment has failed.

But Dr. JOHNSON does not rest his theory upon the induction drawn from the stupendous experience of fifteen cases. He appeals to analogy also. He has observed—that is, he has assumed—that the other modes of treatment which are reported as most successful are, like his own, of an “*eliminative*” character. This is the character he assigns to Dr. AYRE’s system of treatment by frequently-repeated small doses of calomel; and to Dr. STEVENS’s treatment by salina. Unfortunately, Dr. AYRE emphatically repudiates the poison-eliminating crotchet. In an admirable letter to *The Times*, worthy of general perusal, Dr. AYRE says that he gives calomel, not because it is purgative, but for the opposite reason, that it tends to arrest the exhaustive intestinal discharges. Nor need we add, that the principle of the saline treatment gives no countenance to the “*eliminative*” conceit. Dr. JOHNSON’s analogical argument is as baseless as is his pathological assumption.

But what of the ultimate reason—experience? Twelve recoveries out of fifteen cases! What a mass of experience! How conclusive the demonstration! How can we resist such facts? By opposing facts. We will say nothing of the testimony in favour of other modes of treatment—testimony of a somewhat more solid character than that which supports the castor oil theory—we will content ourselves with inquiring whether any other practitioner, whose powers of observation are entitled to the respect of his brethren, has found castor oil as useful in Cholera as it is represented to have been in King’s College Hospital?

We have penned these remarks very unwillingly. Dr. GEORGE JOHNSON’s practice has derived some degree of extrinsic weight, and has done corresponding mischief, from the circumstance of his position as Assistant-Physician to King’s College Hospital. It is the more important to assure the profession in the country that the fanciful hypotheses and irrational treatment adopted at King’s College Hospital do not represent the science or the practice of the metropolis. We are sorry that Dr. G. JOHNSON should have been tempted to forsake the dictates of discretion and of cautious induction, as he has done on this question. There is nothing more pernicious or dangerous than reliance upon erroneous theories and empirical remedies. We think it right to inform the public that however satisfied some people may be upon the matter, the true pathology of Cholera has not yet been discovered. We warn them, at the same time, that one thing at least is certain—namely, that purging is a symptom of imminent danger, and that castor oil may really prove to be a more dangerous poison in Cholera than that “*mysterious poison*” which is supposed to circulate in the blood.

AN Examining Medical Board, entrusted with the important and responsible office of selecting the best qualified medical candidates for nomination to commissions in the Indian army, ought, in justice to our various medical schools throughout the kingdom, to consist of men of independent means and position in the profession; of high character for both theoretical

and practical skill in everything relative, not to Medicine and Surgery only, but to the diseases of military life; and if no such men were to be found to compose such a Board from amongst the ranks of the Medical Service of India, then, certainly, Sir CHARLES WOOD would have been justified in altogether ignoring the claims and services of Indian physicians and surgeons, and in selecting a Board, as he has done, from the younger members of our profession in this country, without any admixture of retired Indian servants. But the very reverse of this is the case. A contemporary, in his issue of the week before last, by an elaborate article "On the rising Practical and Professional Merits of Dr. PARKES, Messrs. PAGET, BUSK, and "HOOKER," has endeavoured to show their perfect fitness and qualification for testing those of medical candidates from the schools of this Metropolis, Edinburgh, and Dublin, who may present themselves for examination next January. We have already called in question the soundness of this opinion; and without any hostility to the gentlemen who have been nominated to the Board, or wish to depreciate their general scientific and professional knowledge of subjects on which they are Examiners, we are still prepared to repudiate the idea that, admitting their perfect knowledge of principles in each branch of the profession, they are yet the most fit men who might have been selected for the task assigned them, or with a view of obtaining perfect impartiality of nomination of the candidates for a special and peculiar service. The general objects to be secured in selecting the best men, tested by such examination, should be superior knowledge of all the most recent and approved principles and practice of Medicine, Surgery, Anatomy, and their relative sub-divisions, with like superiority of theoretical clinical skill to apply such principles in the prevention and cure of diseases generated under the peculiar localities, climates, and other contingencies which affect military and naval life. Will our contemporary have the hardihood to assert that the gentlemen selected have knowledge and experience best fitted for this task? Their appointment, without any admixture of Indian medical servants, instigated by the counsel of those little capable of advising Sir CHARLES WOOD impartially or honestly in such matters, must be considered as a gross act of injustice to the well-known scientific medical labours of those Indian medical officers who have added greatly to the general knowledge of disease by their important professional printed reports, and by conveying such knowledge to the native youths who have been taught in the medical colleges of India. To exclude such men from participating in the selection of medical candidates for their own service, with the requisites for which they must necessarily be best acquainted, is an act at once impolitic and unjust, and which will, we doubt not, be arraigned by some independent Member of the House of Commons when Parliament again meets. It is, indeed, to act over again that disgraceful drama of military medical life, when Messrs. PERRIS and Co., the Army Medical Board of this country, without any knowledge of requisites for the service over which they presided, and for which they were to nominate medical officials, were enabled to ignore the energetic and distinguished services of the judicious and eminent Dr. JACKSON, by pandering to the prejudices and interests of men in place and in power. Our contemporary has fixed on us a charge of being instigated by clique views in this matter; but with an obliquity of vision characteristic of the cause he has undertaken to defend, and with a subserviency and sophism

peculiarly his own, has lost sight of the question in its bearing on the character and interests of a large, intelligent, and most meritorious class of army medical officers, who will not be disposed, we trust, to let it rest with the decision of Sir CHARLES WOOD and his advisers, but will demand justice being done them, by petitioning Parliament against such impolitic proceedings. We know that the voice of the Court of Directors for India, and that of the independent part of both the professional and lay public, will ratify the justice and propriety of our views on this subject. It is not a question of ephemeral notoriety for which we are now contending; it is one intimately connected with the efficient working of the new India Act, and which deeply concerns the practical efficiency of men selected for India, on whose knowledge of the practical bearing of the professional principles taught them must hang the fate, for good or evil, of thousands of our European and Native soldiery, with their wives and children, in India. It may serve the views of certain medical institutions of this Metropolis to have their interests represented by members of the new Board connected with them; while the wider and more liberal representation of medical interests in the Universities of Edinburgh, Dublin, Glasgow, Aberdeen, and St. Andrew's, has been altogether withheld. It may also suit the purposes of some medical practitioners in this country, to get rid of the troublesome competition of Indian talent and experience in the arena of public medical life. But on this subject, as on every other of professional interest advocated by us for years past, we shall never relax our efforts to denounce and get rid of every vicious system of monopoly and self-interest by which the general welfare of the profession, and of medical institutions generally, would be sacrificed for the benefit of the strong against the weak. Was it for the very reverse of this object that our contemporary, with virtuous self-sacrifice and new-born zeal for the unity and good of the profession, was recently induced to league with other enemies against us, that having got rid of us and our opposition he might make things pleasant to his courtly patrons and friends? The spirit of the age and the free-born hearts of Englishmen revolt at the idea of so meanly sacrificing questions of public principle for the chimerical realization of an unity of opinion that is impossible so long as medical nature continues to be human nature. We shall not cease, therefore, from advocating the cause of the Indian Medical Service till full redress has been obtained for the injustice that has been done it by the present constitution of the Indian Medical Board of Examination. Surely men without knowledge of the country and institutions of India, and with little or no experience in the treatment of Indian diseases, are not the most fit advisers of Sir CHARLES WOOD as to what further system of medical examination may be necessary after next January. We have demolished, we believe, our contemporary's flimsy plea of supporting professional interests and unity and the cause he advocates, and prefer doing justice to a most intelligent and meritorious Medical Service, combined with the impartial administration of the public interests.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, SEPTEMBER 16.**—In the week extending from the 3rd to the 9th of September, the deaths of 3413 persons were recorded, and 2050 of the number were caused by cholera; which had, in partial eruptions all over London, destroyed in nine weeks, 5, 26, 133, 399, 644, 729, 847, 1287, 2050, or, in the aggregate, 6120 lives. The outbreak began later than the corresponding outbreak of 1849, which by the same date had, in sixteen weeks, been fatal to 10,143 persons.

## PROVINCIAL MEDICAL AND SURGICAL ASSOCIATION.

## ANNIVERSARY MEETING AT MANCHESTER.

THE twenty-second anniversary of this association was held last week in this city, and was attended by between 250 and 300 members. On Tuesday evening, the council assembled in the lecture theatre of the Royal Institution, Moseley-street. The first general meeting of the members was held in the same place on Wednesday, at ten o'clock in the forenoon.

SIR CHARLES HASTINGS explained that the president for the past year (Dr. Bird, of Swansea,) was unable to be present; but had desired him (Sir Charles) to express his continued feeling of interest in the association, and his gratitude for the honourable position in which he had been placed by the members.

MR. W. J. WILSON, (senior surgeon of the Manchester Royal Infirmary,) the president elect, then took the chair.

DR. WILLIAMS, the secretary, read the annual report, of which the following is an abstract:—Whilst gratified by the flourishing condition of the district branches generally, and with an increase, since the last annual meeting, of 348 members, the total number at present being 2227, the council deeply regretted the death of Mr. James Pook Sheppard, who had discharged the responsible duties of general secretary with strict fidelity. They had appointed Dr. Williams as his successor until the present anniversary, and his appointment was submitted to that meeting for confirmation. The association's *Journal* had been published weekly, under the management of Dr. Cormack, but at an expense so large that, in the present state of the finances of the association, it became a question for very careful consideration whether the resources would be adequate for its maintenance in the present form, and also for the publication of the "Transactions," the 20th volume of which ought shortly to be in the possession of the members. The account of the treasurer, for the year ending July 31st, showed a balance in hand of £24 18s. 11d. The subscriptions received amounted to £1812 11s. 3d., which, with a balance of £8 12s. 9d. from last year, made the total amount of income £1821 4s. The items of expenditure were—miscellaneous expenses in connection with the society's *Journal*, £1291 6s. 6d.; editor of the *Journal*, £250; plates for the last volume of "Transactions" and general account, £44 19s.; anniversary expenses, £24; secretary, £111 1s.; district branches, £39 17s.; sundries, £35 1s. 7d. A statement of *Journal* accounts for the half-year ending June 30th, 1854, showed that the revenue from it amounted to £516 5s., whilst the expenditure had been—editorial department, £192 6s. 6d.; commercial department, £1050 6s. 9d.; miscellaneous expenses, £122 8s. 9d.; making a total of £1365 2s. Its assets amounted to £670 9s. 5d.; and its liabilities £1171 3s. 11d. The subscriptions due to the association amounted to £1304 2s. The funds already voted to the medical reform committee being nearly exhausted, the council recommended that a further sum of £50 should be placed at their disposal. One of the rules of the association is "That all members of the Provincial Association be admissible to the district branch on signifying to one of the secretaries their desire to have their names enrolled." The Metropolitan Counties Branch had applied to the central council to confirm the addition of the following words:—"Provided the majority of the members present at a general meeting concur in their admission." It was the unanimous opinion of the council that the change proposed was contrary to the fundamental laws of the association, and they had therefore allowed the point to remain in abeyance until the meeting of the general council at the present anniversary.

On the motion of Dr. THEOPHILUS THOMSON, seconded by Dr. ADAMS, the reception of the report was agreed to.

MR. MICHAEL moved the reading of the report of the *Journal* committee.

DR. COWAN then read that report, of which the following is an abstract:—The leading features of the new system of publication, which had been in operation three months, were—1st, the appointment of Dr. Cormack, at £250 a year, (the same salary as was paid when the journal was brought out only fortnightly); 2nd, the confiding the monetary management to Dr. Cormack, without a salary; 3rd, the authorising the editor to expend upon literary assistance, &c., a sum not exceeding £50 per quarter; 4th, the keeping of expenditure within the income—the income consisting of the sum produced by the sale of copies of the *Journal*, charges for advertisements, and the subscriptions of members, deducting £300 as an allow-

ance for defaulters. After entering into a variety of financial details, the committee suggested,—1st, that as the business department involves the exercise of talent and responsibility, it ought no longer to be managed gratuitously, and that the manager give security for at least £500; 2ndly, that the business department be conducted, under the direction of the present editor, by a salaried commercial assistant, whose time would be devoted to the business of the *Journal*; 3dly, that Dr. Cormack be requested to regulate, with the assistance of a clerk, the business department. Although the funds of the association did not, perhaps, warrant an increase in Dr. Cormack's salary, the committee suggested that, on his accepting the enlarged duties, he should be required to furnish the security named, and should receive an increase in salary of £100 per annum for the current year, with the understanding that his salary would be further augmented if increase of the funds should justify it.

The reception of this report having been agreed to, the adoption of the council's report was moved and seconded.

As an amendment, Dr. COWAN moved, and Mr. P. MARTIN seconded,—That, in consequence of the transference of the publication of the *Journal* from Worcester to London, a paid secretary at Worcester is no longer desirable, and that the duties of the office be in future discharged by the editor of the *Journal*, in conjunction with a salaried commercial assistant, who shall keep the association's accounts, collect subscriptions, and assist in the commercial department of the *Journal*.

After a long discussion, in which Dr. Tunstall, Dr. Noble, Mr. Nunneley, Mr. Michael, Sir Charles Hastings, Dr. Cormack, Dr. Lankester, Mr. Edwards, Dr. Simpson, and others, took part, the amendment was carried by a large majority.

The meeting then, about a quarter to two o'clock, adjourned.

On the re-assembling of the members, shortly after half-past two, the address in Medicine was delivered by Dr. CONOLLY, who traced the outline of the modern, or non-restraint, system of lunatic treatment, as adopted at the Hanwell and other asylums.

SIR CHARLES HASTINGS then announced that, in consequence of a difference of opinion existing between himself and a majority of the association, as to the mode in which the affairs of the association ought to be carried on, he wished to resign the offices which he held of vice-president and treasurer.

This announcement produced a very manifest sensation amongst the assembly, and in the conversation that followed, the very strongest desire was expressed that Sir Charles should continue in office; in fact, the members of the association declined to accept his resignation, and he withdrew it.

SIR JOHN FORBES then presented the report of the Benevolent Fund:—During the past year sixty-seven cases have been relieved, at a cost of £556 12s. The number of annuitants are now ten, at a cost of £147 per annum. The trustees have invested an additional sum of £624, which, with the sum of £3359 14s. 6d. previously invested, gives a total of £3983 14s. 6d., the income from which is available for annuities. The cash account for the year ending June 30th, 1854, showed that the following balances were in the Treasurer's hands—Donation fund, £99 8s. 10d.; subscription fund, £39 7s. 10d. The subscriptions for the year had amounted to £718 6s. The number of persons benefited is 302.

MR. PROPERT moved the reception and adoption of the report, and a vote of thanks to Mr. Newnham. The motion was seconded by Mr. JOSEPH HODGSON, carried with acclamation, and responded to by Dr. CONOLLY, on behalf of Mr. Newnham.

MR. G. W. HASTINGS then read the report of the reform committee, of which the following is an abstract:—"Three bills, each having for their object the improvement of the position of medical practitioners, had been introduced during the last session of Parliament; one, for extending to medical graduates of the London University the privileges enjoyed by the Universities of Cambridge and Oxford, had received the royal assent. Later, the Secretary for the Home Department had stated, in reply to a question, his intention to move for the appointment of a royal commission, or a special committee, to inquire into the present state of the profession and the laws relating thereto. Mr. Brady introduced a measure which they felt to be so unsatisfactory that they opposed it with the utmost vigor. The opposition was successful. The introduction of Mr. Craufurd's bill was opposed by Lord Palmerston, on the ground that it was better to wait until the medical profession put forward some scheme of their own. The committee were surprised that Lord Palmerston should have

forgotten the fact of their having placed in his hands a measure which had been approved of by the association at large. However, they felt that some scheme should be put forward at the present meeting; and, as Mr. Craufurd's bill carried out the principle of the association, and embodied several of the alterations recommended to be made in their own draft bill, they had printed it, with a few alterations, in their own *Journal*, to take the opinion of the association upon it at that meeting. They concluded by recommending that a committee should be appointed to watch over the course of medical legislation, that committee to be charged with the duty of bringing forward the views of the association before a commission or committee of the House of Commons, and also the adoption of a memorial."

Dr. CONOLLY moved the adoption of the report; the re-appointment of the committee, with certain additions; that a memorial should be signed by the chairman, and transmitted to the Home Secretary; and that the committee should be empowered to forward a petition, in the name of the association, to each House of Parliament, praying for immediate legislation.

The motion was seconded, and, after some explanations, adopted.

The meeting was then (at half-past five o'clock) adjourned.

In the evening there was a conversazione in the Picture Gallery of the Royal Institution, which was placed at the disposal of the association by the council of the Royal Institution. In the course of the evening the claims of the Medical Benevolent College were brought before the members by Mr. PROPERT, who said that his anxious desire to recommend it to the approval and support of every member of the profession was his excuse for the obtrusion. In the course of his address, Mr. PROPERT stated that that portion of the College commenced was already roofed in, and would be ready for occupation on the 25th of June, 1855, which would be the fourth anniversary of his first movement in this "glorious cause." (Applause.) As his Royal Highness Prince Albert graciously laid the first stone, he had every reason to hope that the Queen would honour this national undertaking at the opening. In consequence of the high price of materials, the council had been reluctantly compelled to limit the extent of the original contract; but the number of applicants for admission having very far exceeded what they could possibly accommodate, the council, at its last meeting, decided on immediately erecting eight more residences, so that they might be enabled to receive at least a fair proportion of the most urgent cases. He concluded by appealing for support commensurate with the profession and with the distress which existed in its ranks, stating that 10s. annually from each medical practitioner would amply endow the institution, meet every case of want, and remove any misapprehension that might be entertained as to the benefits of the institution being confined to the immediate friends of the London council. It was intended to form local councils, to be composed of life governors, in each county, in order to represent the claims of every applicant.

On Thursday the proceedings commenced at eleven o'clock in the forenoon.

Dr. RADFORD read a paper on the Cæsarian operation.

Dr. CORMACK then, in answer to Dr. Noble, stated that, after careful consideration, he had accepted the offer made to him in the resolution passed on the preceding day. He moved a vote of thanks to Dr. Williams, for the manner in which he had performed the duties of secretary since the demise of Mr. Sheppard.

Sir C. HASTINGS acknowledged the vote in the absence of Dr. Williams.

It was then resolved that the anniversary meeting of 1855 should be held at York; that Dr. Simpson (of York) should be appointed president-elect; and that Mr. Richard Hey, of York (whose name was said to have been associated with surgical literature for some years,) should be requested to deliver the address on surgery, and Dr. Bell Salter, of Rye, the address on medicine.

Resolutions were then passed, constituting the members of the association resident within twenty miles of Worcester, an executive council, to whom the editor of the *Journal* and the secretary should be responsible; requesting the *Journal* committee to continue their services; reappointing the medico-ethical committee, &c.

A motion, of which notice had been given, by Mr. PETER MARTIN, to alter Rule 1, by styling the association the "British Medical and Surgical Association," provoked considerable discussion, and resulted in the withdrawal of the motion, on

the understanding that the subject should be referred to a committee.

A resolution was moved by Dr. JOHN BARCLAY, and seconded by Dr. BURNETT—"That, in the opinion of this meeting, the representative system ought to be fully adopted, in the constitution and government of the association, and that a committee be appointed, consisting of the president, the president-elect, the president of the council, the secretary, the literary secretary, (Dr. P. Williams,) the secretaries of the branches, and the editor of the *Journal*, to examine, revise, alter, and amend the laws of the association, and especially those relating to the election of members of the council, and the constitution of the branches, and to have the power of conducting the proceedings by letter; that it be an instruction to this committee to ascertain the opinion of each member of the association upon the whole of their recommended changes, and to give necessary notices for any change in the laws; that the report be submitted to the next annual meeting, having been put into the hands of the members at least four weeks previously; and that the funds necessary for satisfactorily conducting the inquiry be supplied by the secretary of the association." This was unanimously adopted.

Dr. R. HALL, Torquay, read a paper, illustrated by drawings, "On fatty degeneration of the epithelial cells as the precursor of tubercular deposit in the lungs in chronic phthisis;" and Dr. G. DAVEY, Bristol, one "On the law of lunacy."

The proceedings terminated by the reading of a paper by Mr. J. WINDSOR, Manchester, "On a case of empyema successfully treated by thoracentesis—third tapping."

In the evening a number of the members dined together at the Albion Hotel.

## Correspondence.

"Audi alteram partem."

## ABSENCE OF PREMONITORY SYMPTOMS OF CHOLERA.

To the Editor of THE LANCET.

SIR,—In the *Spectator* of the 9th instant it is stated that, "Dr. R. Austin Allen has written to the *Morning Post* to call in question recent statements in the Registrar-General's reports and in THE LANCET, of fatal cholera cases without premonitory symptoms or predisposing causes. Most of the cases were those of young children, where it is difficult to arrive at the exact truth. Dr. Allen investigated five cases."

These cases are stated, but in such a way that they cannot be identified. Of the cases in the Registrar-General's reports I shall say nothing; but out of the six cases quoted in THE LANCET for the 2nd inst., I reported two to the Registrar-General, and I am prepared to answer for the accuracy of these, so far as the evidence of the friends of the patients (the only source of such information to be obtained) will enable me; and I have ascertained that no inquiries have been made by any one, concerning these two cases, of the friends. Permit me to say that your remarks on the existence and duration of the premonitory diarrhoea are exactly those I communicated to Dr. MacLoughlan last autumn, when he called on me concerning a case in which the premonitory diarrhoea was only of two hours' duration, and in which nearly six pints of rice-water fluid passed in two evacuations at the interval of an hour, collapse being complete two hours after the first evacuation. In this case the patient affirmed to me that the bowels had been relieved but once on the previous day, and that the motion was perfectly natural. Of what avail practically is such a premonitory diarrhoea as occurred in this case, and in two of those quoted in your recent article? Is it possible that any treatment could arrest so sudden and rapid a flow of fluid from the gastro-intestinal mucous membrane? Dr. MacLoughlan did not quote this case in his list of errata of the medical reports last autumn, or I should have replied to him.

Before I close this note, I am desirous of calling the attention of the profession to the rapid increase of indirect advertisements by medical practitioners in the shape of letters to the public papers, on subjects for which medical journals alone are the fitting arena; and the mischievous effects of those in particular that broadly recommend certain infallible receipts of their authors,—such, for example, as ammonia and ether, or carbonate of soda and mint-tea, thereby inducing the public to lose much valuable time in the use of these medicines until the unfortunate patient shows such desperate symptoms that the

friends are compelled to call in professional assistance, often when too late for beneficial action. Such a course of conduct I believe to be deserving of the strongest reprobation.

I am, Sir, your obedient servant,  
Wandsworth-road, Sept. 1854. P. B. AYRES, M.D. Lond.

## TREATMENT OF DIARRHŒA.

To the Editor of THE LANCET.

SIR,—I shall be much obliged if you will insert in your next number the following treatment for diarrhœa in all its forms; I have given it for the last fifteen years with the greatest success, and I consider it a specific for the disease:—Diacetate of lead, twelve grains; tincture of opium, one drachm, or acetate of morphia, one grain; dilute acetic acid, three drachms; water, six ounces; make a mixture: a sixth part to be taken every two, three, or four hours. If there is severe sickness or violent cramps, I give half a grain of hydrochloride of morphia in an ounce of camphor mixture, and a tablespoonful of the lead mixture every hour; the sickness, cramp, and diarrhœa are soon relieved. It never produces colic. I have given it in hæmoptysis to the extent of causing blueness of the gums, without leaving the least ill effect on the constitution.

I am, Sir, your obedient servant,  
Graysend, Sept. 1854. WM. SANDERS, M.D.

## TREATMENT OF CHOLERA BY INJECTIONS INTO VEINS.

To the Editor of THE LANCET.

SIR,—I observe, in the last number of THE LANCET, that, at St. Bartholomew's Hospital, Mr. Wood has been trying in cholera the effect of injecting saline solutions into the venous system. It is stated that the proportions have been so regulated as to imitate the saline constituents of the serum of the blood. Borrowing the notion from this observation, I beg to suggest the injection into the veins of whey—the serum of milk. It is said by chemists to possess all the necessary saline, as well as some other properties for the formation of the body. If the whey is obtained from fresh and pure milk, by the means of rennet, I cannot see any danger to the patient in the proposed application.

I have the honour to remain, Sir, your obedient servant,  
Lincoln, September, 1854. M.D.

## THE CHOLERA.

In our article of August the 19th, (p. 158,) we drew attention to the various and contradictory theories broached in connexion with the treatment of cholera, and to the too often very violent and illogical manner in which the therapeutic arguments have been carried on. We did not then, however, think it necessary to indicate every drug and method of procedure that had been advised, nor do we hold it to be necessary to do so now; we recur to the particular point before us, however, as we must register in due place and form the accession of a "new method," though it should turn out to be, like too many of its congeners,—

"Full of sound and fury, signifying nothing."

Setting all minor (and their name is legion) methods aside, we may draw attention to the following chief practices that have been "trumpet-tongued" advised in the treatment of cholera since its first appearance in 1831-32; each one for the time being lauded to the skies, and each one in succession bowing to its more fashionable and novel successor.

First.—There was the stimulating plan, according to which alcoholic compounds, etherial fluids, ammonia, volatile oils, pepper, spices, nux vomica, and camphor, were the drugs whose aid was mainly to be sought.

Secondly.—There was the Indian plan, as some called it, in which one scruple or half-drachm doses of calomel were given for a few times, and then followed at (variable) intervals, by ten, five, two grains in succession.

Thirdly.—There was the calomel and opium method, according to which it was conceived that opium, whether in combination with large or small doses of mercury, or anything else, played a most essential and indeed unequalled part; modifications of which opium and calomel plan were innumerable, but those in which this combination was accompanied by vene-

section on the one hand, and by the warm or vapour bath on the other, were perhaps the more important.

Fifthly.—Arose the saline plan of treatment, in which one party advised the administration of large and frequent doses of certain salts of potash and soda by mouth, while another proposed and practised the injection of them directly into the venous system.

Sixthly.—Very great stress was laid, and still is by many, upon that view of the therapeutics of cholera which prescribes small doses (one or two grains) of calomel every five or ten minutes "until the symptoms of collapse become materially subdued."

Seventhly.—We have been told that neither in stimulation, calomelization, narcosis, or venesection is the cure for cholera to be found, but that it is in the free administration of vegetable and mineral acids, and of the sulphuric acid in particular, that the *To kalon* lies embalmed.

Now, as neither of these "best plans" of treatment had their birth in the present epidemic, it was perhaps scarcely to be expected the pestilence should pass over without some warm and enthusiastic practitioner bringing another into the world. And so it has happened, and with a warmth of enthusiasm, too, beyond our expectation, considering the new method had only fifteen cases for its basis; and beyond our explanation, too, were it not that, as we before remarked, (*ante*, page 194,) there is a fatality in the readiness with which physicians, who devote much time to physiologic and microscopic investigation, yield themselves up to strange vagaries of opinion on the nature and treatment of disease. Nevertheless, it is our duty to record in this place that at present the "method of treatment which," according to Dr. George Johnson, "promises a more than ordinary amount of success," is the administration of castor oil, "in doses of half an ounce every half-hour," and that "more than one patient has had as much as a pint in the course of forty-eight hours with impunity." Since this new method has been promulgated in the daily newspapers, there has been, as might be expected, a "run" upon castor oil, as there was upon oleum cajuputi (previously a cure for cholera) in 1831, when it rose from two to fourteen shillings an ounce. As in the case of the calomel, saline, and acid, &c., "plans," we receive a few communications in favour, but a multitude against this "new method."

Dr. Corner, of the Tower Hamlets Dispensary, writes to us to say that he has, "in several cases of very severe diarrhœa, given castor oil a fair trial, as recommended by Dr. Johnson, but it was only useful in mild cases, and in severe ones appeared to aggravate the symptoms; and that, in both diarrhœa and cholera, calomel, in from eight to fifteen grain doses, is the remedy which he has found most beneficial." Another correspondent informs us that those persons at Vera Cruz having its deadly fever, who are "treated by calomel, uniformly die," whilst those "treated by the administration of castor oil and lime juice, mixed," recover. He would therefore suggest the addition of lemon juice to the "new remedy" for cholera. A third, whose letter is before us, recommends "a cataplasm of mustard applied to the whole body, from the neck downwards;" while Mr. Chaplin, of the Bloomsbury Dispensary, informs us that, during the fortnight ending September 13th, "only four cases of cholera have presented themselves. These have all done well under the calomel, rhubarb, and saline plan of treatment." Our space will not permit us to give the details of Mr. Chaplin's communication, able though it be. In the September number of the *Pharmaceutical Journal* we find some observations bearing reference to our own remarks (quoted) of August the 19th, and pointing out the agents and formulæ druggists have been most called upon to dispense during the present epidemic. We extract the following:—"Sulphuric acid has of late been prominently brought forward. It is given in doses of twenty to forty minims, repeated every two or three hours, or oftener if occasion requires. Sometimes half a drachm or a drachm of chloric ether is added to each dose. Another prescription consists of twenty or thirty minims of laudanum, with about double the quantity of sulphuric ether; or the following:—Chloric ether, half a drachm; aromatic confection, one scruple; Battley's liquor opii, ten minims; spirit of sal volatile, half a drachm; mix."

We may also acknowledge the receipt of the third edition of Mr. Stephens's tract "On Cholera," in which it is taught that it is "to antiseptics we must look for the curative means" generally, and in particular to *creosote*; nor can we leave this department of the subject without recording the "important suggestion" (as he himself calls it,) of another physiological physician, and its support by a chemical one, towards a satisfac-

tory treatment of the stage of collapse. The former (B. W. Richardson, M.D.) advises, "that into the peritonæum or the cellular tissue of a patient in a proper state of collapse from cholera, water, to the extent of at least a tenth or even a fifth part of the whole weight of the body," be injected; the latter, (W. B. Herapath, M.D.), believing this to be an "extremely philosophical and ingenious suggestion," thinks it might be improved—we mean the *water*—if its adviser would add *milk* to it, seeing we should thus "avoid the chances of destruction of the blood corpuscles," &c. We trust we may not be thought going beyond our proper duty in asking the calm attention of all past, present, and future propounders of new methods of treating disease to the following quotation from the "Natural History" of Pliny, "*Naturæ vero rerum vis atque majestas in omnibus momentis fide caret, si quis modo partes ejus ac non totam complectatur animo.*"—Lib. vii. c. 1.

Since the above was written, we have received very many other communications, sufficient, indeed, to supply matter for the next half-dozen numbers of the journal. Mr. Boddington describes more particularly the details connected with the administration of sulphuric acid, and Dr. Shorthouse gives us the results of his trial of Dr. Ayre's plan of treatment. Dr. Shorthouse believes it to be "a delusion and a humbug; in itself no doubt *harmless* enough, but, as it prevents other kinds of treatment being adopted, a great evil. . . . On examination after death, the calomel was found in the stomach unchanged. From the stomach of one man," he says, "I took *nine drachms* of calomel." In lieu of calomel, Dr. Shorthouse recommends the *phosphate of soda* as the agent *par excellence* in cholera. Mr. G. Selwyn Morris, on the contrary, writes to express his attachment to the doctrines of Dr. Ayre, and to recommend the addition of chloric ether to the medicines employed; whilst M. Meinig, in a communication, draws our attention to the value of continuous currents of electricity. Mr. Walker, of Burslem, favours us with his reasons for believing in the contagiousness of cholera, and that "there can remain but little room for doubt that its spread is generally to be attributed to that source;" while Dr. Robert Fowler, admitting it to be "communicable from one person to another," yet contends "that, in its *general diffusion*, it does not spread by contagion, but that the disease is a true epidemic, depending on telluric or atmospheric influences." Dr. Maxwell, amongst other items, furnishes us with two prescriptions, compounded of no less than *eighteen* ingredients, the oil of juniper and quinine appearing to us as the *pièces de résistance* in them.

A less complex therapeutic armatory is found in the new drug now being employed in Paris—viz., *guarana*, a substance procured from the seeds of *Paullinia sorbilis*, containing tannate of caffeine and a special resinous ingredient, &c.; and for drawing our attention to which we stand indebted to Mr. Howard Hopley.

We must close this notice by the acknowledgment of the receipt of Mr. Borham's "cases and remarks" on cholera, which, as he tells us, have been committed to paper, "not with any idea of being able to render things more clear with regard to its origin or pathology, nor to suggest anything particularly novel in its treatment," will scarcely demand more lengthened analysis. Mr. Borham's own opening luminous paragraph, indeed, forbids it. "At the mention," says he "of the word Cholera, in its true sense, decimating as it is doing our population and army, the practical surgeon is struck with feelings of awe, and if he possess a mind, it becomes enveloped in a confusion of ideas which seem to get more confounded as he proceeds to think."

Relative to the progress of the cholera in the metropolis, we condense the following from the "Weekly Return" of the Registrar General, for the week ending September 16th:—

Districts.	Elevation above water mark.	Population (1851).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	115
Central (St. Giles, &c.)	49 "	393,256	106
Western (Kensington, &c.)	28 "	376,427	248
Eastern (Shoreditch, &c.)	26 "	485,522	224
Southern (St. Saviour's, Lambeth, &c.)	6 "	616,635	856
			1549

Of these 614 were under 15 years of age.  
 901 " above 15 and under 60.  
 203 " above 60 years old.  
 2 the ages were unknown.

We are thus glad to find that the deaths from cholera, instead of 2060 are 1549, or 501 less than the deaths from the same cause in the preceding week. The total deaths in the present eruption have been 7669; in the eruption of 1849 the deaths by cholera up to the same date, within one day, were 11,825. In both of the eruptions the mortality was highest on nearly the same day of September; its decline commenced in the corresponding week; and we may now sanguinely hope that it will descend as rapidly as it did in the autumn of 1849.

But no exertion should be spared to save the thousands whose lives are still threatened; and the dread lesson, before regarded so little, should never be forgotten,—that men can no longer drink polluted water—breathe impure air—neglect sanatory measures year after year—with impunity.

The result of the investigation by the Medical Council of the Board of Health into the treatment by *castor oil* has just been published. We have (at the last moment of going to press) only room for the following *résumé*:—

"It appears that in eighty-nine cases of cholera, treated by fourteen different practitioners with castor oil on the plan recommended by Dr. Johnson, sixty-eight were fatal, recovery having occurred only in fifteen cases, while the six remaining cases are still under treatment. The above report having been laid before the Council, and approved by them, it was resolved that the same be communicated to the President of the General Board of Health.

"Whitehall, Sept. 15th, 1854"

#### THE GENERAL BOARD OF HEALTH.

THE Medical Council of the Board of Health having been requested by the President to prepare any formula that the Board might make public for use in cases of premonitory diarrhoea before the arrival of medical aid, the following resolutions were agreed to:—

"That the Medical Council think it, as a rule, dangerous for non-medical persons to resort to the use of drugs without medical advice, and especially they deprecate the extensive use of opiates on the one hand, and, on the other hand, of aperients, such as castor oil and salts.

"The Medical Council, moreover, deem it impossible to prescribe a remedy which would be appropriately or even safely taken by all persons suffering from diarrhoea.

"They are of opinion that the paper called 'Precautions against Cholera' contains instructions for all the measures which the public unadvised should adopt. But they suggest that the heads of families should consult their usual medical attendants as to the measures to be taken in cases of emergency; and that the medical officers appointed by boards of guardians and other parish authorities should take care to give the same information to persons of the poorer classes.

#### "GENERAL BOARD OF HEALTH.—PRECAUTIONS AGAINST CHOLERA.

"1. Apply for medicine immediately to stop looseness of the bowels, or it may bring on cholera.

"2. Do not take any strong opening medicine without medical advice.

"3. Beware of drink, for excess in beer, wine, or spirits is likely to be followed by cholera.

"4. Drink no water which has not been boiled; and avoid that which is not quite clear and without taste.

"5. Avoid eating meat that is tainted, decayed or unripe fruit, and stale fish or raw vegetables. Cooked vegetables, or ripe and cooked fruit, in moderation, are a necessary part of diet at all times.

"6. Avoid fasting too long; be moderate at meals.

"7. Avoid great fatigue, and getting heated and then chilled.

"8. Avoid getting wet, or remaining in wet clothes.

"9. Keep yourself clean, and your body and feet as dry and as warm as your means and occupation will permit.

"10. Keep your rooms well cleaned and limewashed; remove all dirt and impurities immediately.

"11. Keep your windows open as much as possible to admit fresh air, and, if necessary, use chloride of lime or zinc to remove any offensive smells.

"12. If there are any dust or dirt heaps, foul drains, bad smells, or other nuisances in the house or neighbourhood, make

complaint without delay to the local authorities having legal power to remove them; or, if there be no such authorities, or if you do not know who they are, complain to the board of guardians."

THE following directions and regulations of the General Board of Health have been issued under the authority of the Nuisances Removal and Diseases Prevention Act, 1848:—

"In exercise of the authority vested in us, we, the General Board of Health, direct:—

"1. All surveyors, district or assistant surveyors of highways, trustees, county surveyors, and others by law entrusted with the care and management of streets and public ways and places, and where there are no public authorities so entrusted, the owners and occupiers of houses and tenements adjoining thereto, to take the measures necessary for the frequent and effectual cleansing thereof.

"2. The owners and occupiers and persons having the care and ordering of all houses, dwellings, churches, buildings, and places of assembly, to cleanse, purify, ventilate, and disinfect the same.

"3. All local authorities and persons whatsoever to exert all the powers vested in them by law for the removal of nuisances.

"4. All relations of, or others in charge of the bodies of persons who have died of cholera, or other epidemic disease, to obey the directions of the medical officers of the guardians as to the speedy interment of the dead.

"In these directions and regulations, the word 'guardians' means the guardians, directors, wardens, governors, parochial board, or other like officers having the management of the poor of any union, parish, combination, or place where the matter requiring the cognizance of any such officers arises; and the expression 'local authority' means the town council, local board of health, or any trustees or commissioners for the draining, paving, lighting, cleansing, managing, or directing the police of any town, borough, or place, highway board, or any other body of a like nature, or any commissioners of sewers, or any body, excepting boards of guardians and overseers, having by law powers for the removal of nuisances.

"Given under my hand and under the seal of the General Board of Health this 14th day of September, 1854.

"B. HALL."

## TREATMENT OF CHOLERA.

### ST. PAUL AND ST. BARNABAS DISPENSARY, FENLICO.

MR. J. W. MORRY informs us that since his last communication thirteen cases of cholera have been treated at this institution. In three, the sulphuric acid mixture, with capsicum, was employed. Two of the patients died, and one recovered. The remaining cases have been treated with the small doses of calomel, according to Dr. Ayre's plan, with this difference, that no opiate was given with the first few doses of the powder:—

1. A child, aged eight months. Calomel, half a grain, every half-hour. No consecutive fever. Recovered.

2. A boy, aged five years. During collapse, calomel, half a grain, every ten minutes; during consecutive fever, a draught containing chlorate of potass, three grains, every hour. Recovered.

3. A boy, aged two years and a half. During collapse, calomel, half a grain, every ten minutes; during consecutive fever, the chlorate of potass draught every hour. Recovered.

4. A man, aged thirty-two years. During collapse, calomel, one grain, every ten minutes; during consecutive fever, an effervescent draught of sesquicarbonate of soda and tartaric acid, with five grains of sesquicarbonate of ammonia, every two hours. Recovered.

5. A boy, aged six years. Neglected diarrhoea, a week. This patient had been in collapse for some hours, and appeared moribund when first seen. Calomel, one grain, every ten minutes. Died.

6. A man, aged twenty-two years. During collapse, calomel, one grain, every ten minutes; during consecutive fever, the effervescent mixture every two hours. Is now convalescent.

7. A child, aged one year and a half. During collapse, calomel, quarter of a grain, every five minutes; no consecutive fever. Recovered.

8. A girl, aged five years. During collapse, (which was not so severe as in the other cases,) calomel, one grain, every half-

hour; during consecutive fever, the chlorate of potass mixture. Is now convalescent.

9. A boy, aged three years. Calomel, half a grain, every ten minutes. Died. This patient had been suffering from diarrhoea, which was neglected. The medicines were not given regularly.

10. A woman, aged sixty-two years. During collapse, calomel, one grain, every ten minutes. Reaction has taken place, and she is at present doing well.

Each of the above cases were ordered a foot bath of mustard and water, hot bottles to the feet and axillae, and a large sinapium to the abdomen; after the removal of which, flannels, wrung out with warm water, and sprinkled with turpentine, were constantly applied.

The sulphuric acid treatment has been most successful in many cases of severe choleraic diarrhoea.

### ST. MARYLEBONE WORKHOUSE.

MR. W. BOYD MURPHY, resident medical officer, in a communication which he has forwarded to us, states that,—"The following is an outline of the treatment adopted for diarrhoea amongst the inmates of the workhouse, and as they are debarred from recourse to other medical aid, I can confidently assert that the remedies employed prove successful.

"The cases are often very severe in character, which may be partly explicable by the fact that many of the patients, previous to admission, have had insufficient diet, and some of them have been exposed for several nights without home or shelter, and have not tasted food for twenty-four hours or longer. Treatment is regulated according to the character of the motions, presence or absence of vomiting and cramps, state of the tongue, &c. In diarrhoea of choleraic type, i.e., with vomiting, serous evacuations, and coldness of the extremities, dilute sulphuric acid proves more successful than any other agent, administered in half-drachm doses, with an ounce and a half of camphor mixture, every one, two, three hours, or longer, according to the severity of the symptoms. In most of such cases it acts like a charm, and affords benefit ever after the first dose. If a few doses be not attended with amelioration of symptoms, no good in general results from its employment, and under these circumstances, catechu and chalk are advantageously substituted. I have now and then prescribed the acid with success in ordinary bilious diarrhoea, and it appears to me that we cannot always predicate what cases may and what may not be benefited by its exhibition, for I have in a few instances seen it most signally fail in the serous or choleraic variety. Again, there is frequently a tendency to relapse after the acid treatment, and if it occurs I find catechu or other astringents more beneficial than its repetition. Nevertheless, I believe sulphuric acid to be a very valuable medicine, most applicable for the severer forms of diarrhoea, (although occasionally failing to exert its usual action,) and I make this avowal the more readily, as before trial I was somewhat sceptical of its efficacy.

"In diarrhoea with bilious evacuations, foul tongue, no coldness of the extremities, but general evidence of gastric disorder, simple doses of carbonate of soda, in conjunction with aromatic confection and spirits of ammonia, appear more suitable. When much pain is present, a dose of calomel and opium is first given, and sometimes a sinapium is applied to the epigastrium or abdomen. A few obstinate and more chronic cases of diarrhoea have been treated with opium and lead. Amongst the infants under two years of age, aromatic confection and spirit of ammonia are the customary remedies. In some cases, catechu and chalk are given, and the dilute sulphuric acid, (in five minim doses,) if the dejections are of serous appearance. Once or twice small doses of acetate of lead have been prescribed. Mercury with chalk, with chalk compound, or compound ipecacuanha powder, are sometimes associated with the above.

"There has been no death from diarrhoea amongst the boys, girls, adults, aged and infirm. Amongst the infants in nursery three have died during the last two months; all under twelve months old. The first, a foundling, died of tabes and mucocenteric symptoms of a month's duration. The second of diarrhoea and pneumonia. (Neither of these were suckled.) The third of diarrhoea of five days' duration, its mother having died of cholera some days previously, by which event it was deprived of the breast.

"There has been but one case of decided cholera in the workhouse, which occurred in a man who had had diarrhoea for two or three days previously, and allowed it to remain untreated. He subsequently died in the infirmary."

# Medical Notes.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

*Thursday, September 14th, 1854.*

HALL, EDWARD THOMAS.  
HARRIS, GEORGE, Crawley-street, St. Pancras.  
LAWRENCE, JAMES ELI, East India-road, Poplar.  
SOAME, CHARLES BUCKWORTH HERNE, Elstow, near Bedford.

**BRITISH INVALID HOSPITAL IN THE BOSPHORUS.**—A medical correspondent's letter from Constantinople contains the following particulars of the new naval medical establishment on the shores of the Bosphorus, for British sailors. The house is a Turkish kiosk, formerly the country residence of the Sultan. It is of considerable extent, the apartments are lofty and well ventilated, and the building is situated a little below Therapia, on the European side of the strait. There is a large garden attached, which is of great use as an airing ground for the convalescent. The whole is surrounded by a high wall, so that there is no chance of them getting out and committing irregularities. At present it is only fitted up for the accommodation of sixty patients, but additional stores are shortly expected, when it will be completed for 150 patients. The staff at present consists of one surgeon, one assistant-surgeon, an agent and steward to look after the commissariat department, one head nurse, and as many additional nurses as may be required, a cook, and the necessary servants. There is also a marine sergeant and three marines as a guard. The number of patients at any one time has not as yet exceeded fifty. The principal diseases which have been hitherto prevalent are fevers of a low type, pulmonary affections, sleuthing ulcers, and a few fractures. The French have an hospital in close proximity, which can accommodate about seventy patients, but it is not near so convenient as the one just described.

**GARRISON ORDERS AT CHATHAM RESPECTING CHOLERA.**—A woman, a wife of one of the soldiers in this garrison, having recently died of cholera Asiatica, and it having been ascertained that she had been ill for several days before with diarrhoea, without seeking medical advice, the authorities have given orders that the whole of the troops in Chatham barracks are, until further orders, to parade every morning for medical inspection; and also that the whole of the women and children are to assemble every morning in order that their state of health may be ascertained, during the prevalence of the present epidemic.

**MILITARY AND NAVAL INTELLIGENCE.**—Assistant-Surgeon S. Ayerst, (1847), from the *Algiers*, 91, steam-ship, at Sheerness, to the Royal Hospital, Plymouth.—Acting Assistant-Surgeon John G. Smith to the *Algiers*, vice Ayerst, promoted.—Richard W. Macaulay, Gent., to be acting assistant-surgeon, vice Langham.—Dr. Cranford has arrived at Sheerness in the *Humbly*, with Russian prisoners from Bomarsund. He has taken to Chatham some British invalids from Melville Hospital.—Staff Assistant-Surgeon Fenlong has sailed from Chatham in charge of troops for St. Helena.—Assistant-Surgeon George G. Neyer, of the 3rd Buffs, has arrived, from Malta, at Chatham, with a detachment of military invalids.

**MANSLAUGHTER BY A DRUGGIST'S ASSISTANT.**—A verdict of manslaughter has been returned against a druggist's assistant, named Robert Williams, by a coroner's jury sitting at Ashton-under-Lyne, for having caused the death of a young woman by improper treatment during labour. The deceased, Mary Ann Speakman, was a single woman, nineteen years of age. She was taken in labour on Monday evening. A surgeon was sent for, but he was not at home, and Williams volunteered to attend her. During his treatment she screamed violently, and evidently suffered very great pain. She gave birth to a still-born child, and died some time afterwards. A post-mortem examination of the body of the young woman was made by two medical gentlemen, who were of opinion that the treatment by Williams had caused her death, and he was committed for trial by the coroner for manslaughter.

**FREAK OF NATURE.**—Thomas Burgiss, Little Hereford, near Tenbury, has a yearling sheep that is neither male nor female; it has the appearance of being a ewe sheep, but it evidently partakes of both sexes.

# Obituary.

It is with sincere regret that we announce the death, on the 27th ultimo, of Dr. SHEGOG, assistant-surgeon to the 88th Regiment of Foot. He died of cholera, after a few hours' illness, worn out by the most exemplary exertions amongst the numerous cholera patients of his regiment. *The Times* correspondent, in a letter, dated August 29th, expresses himself as follows:—"The cholera still hangs around us. On Sunday night, Dr. Shegog, surgeon of the 88th Regiment, was seized with it, and expired in a few hours, to the profound regret of every man in the regiment. His exertions when the epidemic had been raging, were of the most extraordinary kind. He was by the beds of the patients night and day, and by his care, skill, and kindness, he saved many a life. Mild, unassuming, indefatigable, and amiable, he added to nobleness of heart great decision and energy. His remains were interred yesterday, August the 28th; they were followed to the grave by the regiment—officers, men and women."—Dr. Shegog was personally known to us, and we can fully bear out the statements made by *The Times* correspondent. The deceased was a most kind-hearted, amiable man, very highly valued by his friends and all those (especially the sick) who came in contact with him. He has fallen whilst devoting his whole energy to the performance of the noble and arduous duties which had devolved upon him; and our profession may well be proud of such men. Dr. Shegog had already proved, when in the West Indies with his regiment, that he cheerfully encountered peril and fatigue in the discharge of his duty, for he was highly complimented by the officers in command for his zeal and unremitting attention to the patients during a fearful epidemic of yellow fever. We may add, that we lose in him a most trustworthy and well-informed correspondent, whose graphic pen was as superior in the description of disease as in the condemnation of abuses. Dr. Shegog had graduated at Glasgow, in 1847, and had been admitted a licentiate of the Royal College of Surgeons in Ireland some time before.

Dr. HARWOOD, F.R.S., at St. Leonard's-on-sea, of cholera, after an illness of a few hours.

On the 16th ult., at Kollabie, near Varna, GEORGE KINCAID, M.D. The deceased gentleman was formerly surgeon of the 5th Dragoon Guards, from which he was promoted to the rank of staff-surgeon of the first class. His death may be ascribed to the very severe and exhausting character of the duties which devolved upon the medical staff of the army during the prevalence of the cholera at Varna.

On the 24th of June last, at Rangoon, after a short illness, in the thirty sixth year of his age, JOHN WILLIAM FIRNINGER, Esq., assistant-surgeon of the 19th Native Infantry, and youngest son of Thomas Firninger, Esq., LL.D., Edmonton, Middlesex. The deceased gentleman was appointed to the East Indian Army in February, 1842.

On the 13th inst., at his residence, 5, Argyle-square, Edinburgh, Dr. ENEZEER SKAE. Dr. Skae was well known as a contributor to the medical literature of the north. He was the author of several papers in the *LANCET* and the *Edinburgh Medical Journals*. He was surgeon to the Eye Dispensary, Edinburgh, and a member of the Edinburgh Medical and Chirurgical, and Edinburgh Obstetric Societies.

Post-office Orders to be addressed to EDWARD THOMAS, *THE LANCET* Office 433, Strand, London, and made payable to him at the Strand Post Office.

## The BRITISH MEDICAL DIRECTORY for 1855.

THE Editors of this work respectfully invite duly-qualified Medical Practitioners, who are either resident in London or its suburbs, or may have occasion to visit the metropolis, to call at the Office, 423, Strand, corner of Bedford-street, Covent-garden, and inspect the entries of their names, residences, qualifications, &c., with a view to insure perfectly correct entries in the *BRITISH MEDICAL DIRECTORY* for 1855. A Clerk will be in attendance from ten to four daily.

## TO CORRESPONDENTS.

*A Twenty-one Year's Subscriber.*—There will, we believe, be considerable alterations in the mode of administering Poor-law medical relief. Whether the recommendation of the committee to elect medical officers for life will be adopted, is doubtful; but it is likely that they will be made more independent of the boards of guardians.

*Q. Q.*—All expenses necessary or incidental to the carrying on of a practice should be deducted from the return made to the Income-Tax Commissioners.

*G. W.* is advised to consult a respectable practitioner. He need not despair.

## NON-ADMISSION OF STUDENTS TO THE LOCK HOSPITAL, EDINBURGH.

To the Editor of *THE LANCET*.

SIR,—Now that another winter session is approaching, I beg again to call your attention to the non-admission of students into the Lock Hospital, Edinburgh. My letter on this subject, which you did me the favour to publish in *THE LANCET*, (vol. i. 1854, p. 606,) has been of great use, in so far (as I am given to understand) that a greater number of venereal cases are admitted into the surgical wards than heretofore. But this is not what I advocate. What I advocate is the open and free access to the wards of the Lock. This is what the students require, and surely it is not asking too much. During the time I was a student, I think I remember seeing about a dozen venereal cases in the surgical wards. Had I not seen some cases in dispensary practice, with what a slender knowledge of this important disease should I have commenced my profession!

If the Lock Hospital be for the purposes it professes to have been instituted for—the admission and treatment of venereal diseases—why are students so carefully excluded? One plea for their exclusion is on the score of the immodesty of the thing. This plea is so absurd that I dismiss it at once. Another is, the majority of the students being very young men. If this be seriously urged, let me suggest that none but three and four year's men be admitted. At any rate, let men who are to treat an important class of disease have some means of learning something about what they are to treat before they are sent into the world.

Wield your powerful pen in favour of the Edinburgh medical students, and you will be their best friend. Apologizing for the length of this letter,

September, 1854.

M.D. EDIN. 1852.

*Lector.*—The library of the College of Surgeons is closed during the month of September.

*J. P.*—There is no institution for the cure of stammering. The brutal operations on the throat, which were some time since resorted to, not only failed to effect a cure, but were often attended with disastrous results.

*Unfortunate.*—Persons who advertise to cure secret diseases are usually unqualified. We know nothing of the person mentioned.

*X. X.*—1. With the colonel commanding the regiment.—2. Certainly not.

*Delta.*—On application to Mr. H. Smith, of Southam, Warwickshire, information might be obtained on the subject. We are quite opposed to such institutions.

*A. S. J.*—There can be no possible objection to such a proceeding.

*A Surgeon.*—It is quite useless to refer to the statements of such a person. No one believes him. He could not speak the truth except by accident.

*Mr. C. P. F., (Avebury).*—Does our correspondent wish the subject to which his letter refers publicly alluded to, or discussed? If so, we shall be prepared to enter into the question next week. Some explanation is absolutely requisite.

## CALOMEL IN CHOLERA.

To the Editor of *THE LANCET*.

SIR,—The mortality from the present epidemic appearing from the Registrar-General's Report to be so rapidly on the increase, I deem it my duty to offer to my medical brethren the result of my experience in the treatment of this ravaging disorder. I am aware that many are the plans adopted to combat its influence, and that each can boast its quota of adherents, whilst the plan I advocate must stand alone upon my testimony, (if I except, indeed, the patients who by its means are able, and no doubt willing, to give it credit.) Nevertheless, I boldly recommend it to the profession, feeling convinced that any gentleman who may give it a trial will find it answer his most sanguine expectations. It consists in administering from twenty to eighty or more grains of calomel immediately, according to the urgency of the case, repeating the dose as often as rejected, and following with from five to fifteen grains of the same every quarter or half hour. This I continue without regard to the amount taken till the secretions are restored. With regard to the after effects of the calomel, I can only say that I have given hundreds of grains in a few hours; and of many hundreds of cases so treated during the three visitations, I cannot remember half a dozen who required a gargle. My patients I allow ice or cold water in moderation, and endeavour by all possible means to promote warmth; but do not, except in special cases, and in the smallest quantities, admit of the use of brandy, and never of opium. By this method I have seen cases of the very worst kind quickly recover, and am even now occasionally astonished at its efficacy. I have treated this year 113 cases of cholera, (many collapsed,) out of which I have only lost six, (two aged and previously debilitated, a woman who miscarried, an infant, and two men, one who was previously out of health, and the other neglected for three weeks till at the point of death,) and four of those by the consecutive fever.

Strongly, and with perfect confidence, again recommending the above to my professional brethren,

I have the honour to be, Sir, your obedient servant,

Kennington, Sept. 1854.

HENRY M. M. MEADOWS.

*A. M. D.*—The subject shall receive attention next week.

*Dr. Huggins.*—The diploma is obtainable only by examination. The qualifications necessary for a candidate will be found in the *BRITISH MEDICAL DIRECTORY*.

*A Country Patient.*—Castor oil is a most dangerous remedy in cholera.

*T. J., (Hammersmith).*—There ought to have been inquests in both cases. The person mentioned is unsustained by any professional respectability. Should there be another fatal case, apply to the parish constable, (Wale,) or to the police.

*A Surgeon.*—Dr. Perrett's handbill is beneath notice.

## TREATMENT OF CHOLERA BY CASTOR OIL.

To the Editor of *THE LANCET*.

SIR,—In your last number your correspondent "M.D." has shown, by parallel passages, that I am the author of so much of a theory on cholera as has been advanced by Dr. George Johnson.

Permit me, however, to disclaim the practice he deduces from it, which I consider to arise from a superficial view of the matter, and against the reception of which error I had endeavoured to guard in my work.

I am, Sir, your obedient servant,

Great Marlborough-street, Sept. 1854.

J. G. FRENCH.

*A Sufferer.*—The "remedy" is bad enough; but the logic of Dr. George Johnson is infinitely worse. We much regret it, but so it is. The cases would only add to the number of fatal results.

*A. B.* shall receive our replies to his questions next week.

*Dr. Philbrick (Colchester)* is sincerely thanked for his obliging communication.

*Vindex* must resume his studies with assiduity, or he will not discover the truth.

## A QUESTION FOR THE AUTHORITIES OF WESTMINSTER HOSPITAL.

To the Editor of *THE LANCET*.

SIR,—May I be allowed to put a simple question to the committee of the Westminster Hospital, through your journal—viz.:

Why are the dispensers of that hospital, and whose duties have been very much increased, excluded from the necessary extra allowance of wine, &c., given to every other official in the establishment, porters, nurses, surgery men, &c.?

The dispensary, I am told, is close to the dead-house, the factor from which has been almost overpowering. I trust the omission noticed has been accidental, and will be immediately remedied.—Your obedient servant,

September, 1854.

CHIRBURGH.

In consequence of the pressure on our space, we are compelled to postpone original papers by Mr. Acton, Mr. Vaudin, Mr. Sedgwick, the conclusion of the report on Porter and its Adulterations, and the "Mirror of London Medicine and Surgery," with several other valuable communications.

COMMUNICATIONS, LETTERS, &c., have been received from—Mr. Bolly; Mr. Lightfoot, (Hanwell); Arbor; Dr. J. G. Davy, (Northwoods); Dr. Chawner, (Lincoln); The Registrar of Queen's College, Belfast; Mr. Tucker; Mr. T. R. Edmonds; No. Peckham; Zytham; Dr. Macdonaghian; A Bewildered Practitioner; Mr. Borham; Mr. W. Tuckett, (with enclosure); Mr. J. R. Philippe, (with enclosure); Mr. T. Lukyn, (with enclosure); Unfortunate; X. X.; Mr. Pryce; An M.D.; Adelphe; Mr. French; Delta; The Secretary of the Medical Benevolent Society of Birmingham; Mr. F. G. Johnson; Mr. Tucker, (second communication); E. G. S.; Mr. H. M. Meadows; Mr. J. Williams, (Helstone, with enclosure); Dr. Atkinson; M.D.; E. S. J.; A Surgeon; J. P.; A Surgeon; A Country Patient; A. B.; Mr. Wilmot; G. W., (Glasgow); Messrs. E. and J. B. Marsh, (Liverpool); Dr. Steele, (Dublin); Dr. Ball, (Dublin Castle); Mr. C. P. F., (Avebury); Dr. Huggins; Chirurgus; M.D. Edin.; Vindex; Dr. Philbrick, (Colchester); A Sufferer T. J., (Hammersmith); &c. &c.

**Mr. Edwin Osborne, of 24, Savile-**  
ROW, LONDON, begs to apprise the patrons of the late Firm of Dodge and Osborne, that he is now the Sole Licencee and Maker of PALMER'S PATENT (American) LEG; and, having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given (if required).

**Dissecting and Post-Mortem Instru-**  
MENTS, New and Second-hand. Surgical Instruments of the best description; A. URE'S New Urethrotome for Stricture; New Uterine Compress; Newly Improved Pessary; Instruments for Army and Navy Surgeons; DARTNELL'S Patent Truss; Trusses for Union Surgeons; Enema Syringes; New Syphon Enema, as supplied to the Army; New Spinal Machine, pronounced the best ever invented—at

PRATT'S, Surgical Instrument Maker, 420, Oxford-street.

**M. Pillischer's Newly-Constructed**  
STUDENT'S MICROSCOPE, which, for solidity, portability, and reasonable price, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7 in. by 6 in., £5 10s.; or with M. Pillischer's own-made, 1 in. of 16 degs. angular aperture, and 1 in. of 60 degs., £7.

The above stand with lever stage, extra eye-piece, double mirrors, animalcule cage, &c., £8; or with Pillischer's glasses, £9 10s.

A list of prices will be sent free on application to M. Pillischer, 88, New Bond-street.

**Hooper's Waterproof Sheeting, for**  
protecting Bedding from Sloughing Sores, Incontinence of Urine, Hæmorrhage, &c.

MR. HOOPER has succeeded in obtaining Waterproof Sheeting, at a great reduction in price, soft, and inodorous; it is not affected by Urine, Heat, nor Cold, Acids, nor Alkalies, and may be washed as family linen.

Also, IMPROVED INVALID URINALS, with Valves, for sitting, lying, or travelling, in any position.

FOR EPILEPSY.

**COTYLEDON UMBILICUS.**—The introduction of this valuable agent has proved a valuable discovery. The satisfactory accounts Mr. HOOPER has received have induced him to pay great attention to its collection and preparation. He cautions medical men against the use of worthless preparations, passed off for his, and as prepared for Mr. Salter, &c. Mr. Hooper has instructions to state that Mr. Salter has never used any but that obtained from him. A copy of Mr. Salter's reports in the "Medical Gazette" sent free by post.

**GALUM APARINE (HOOPER'S) FOR CUTANEOUS DISEASES, PSORIASIS, &c.**—Dr. Winn, of Finsbury-square, having published in "The Medical Gazette," October 4th, 1851, an account of the peculiar properties of the Galium Aparine in Cutaneous Diseases, Leprosy, Psoriasis, &c., Mr. Hooper has given his attention to preparing it in various forms. Dr. Winn finds the inspissated juice the most efficient preparation, which can be had from Mr. Hooper, or direct through the Wholesale Houses.

HOOPER, Operative Chemist, Pall Mall East, and Grosvenor-street.

**Mr. Hooper's Water Mattresses or**  
BEDS, and CUSHIONS for AIR or WATER, for placing on an ordinary Bedstead. Being made of India-rubber, without the admixture of cloth materials, leakage is avoided. (Extract from THE LANCET, Jan. 25, 1851.)

**CUSHIONS FOR BED-SORES.**—Whether threatened with Sloughing, or in which Sloughing has taken place, Fractures, Diseased Joints, Spasms, Lassitude, Typhoid and other Fevers, Rheumatic affections, Dropsy, Coldness of the Stomach and Feet, Consumptive and all Bed-ridden Patients. They are simply to be placed on an ordinary bedstead. These Cushions and Beds are not affected by Heat or Cold, and will bear water at any temperature.

Finsbury-square, February 27, 1852.

I have in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water Bed.

JON. PEREIRA, M.D., Physician to the London Hospital.

Infirmary, Chichester, March 21, 1852.

Sir,—We are all much pleased with your Cushions, and still more so with the Mattresses.

Yours truly,

THOS. NEWHAM, House-Surgeon.

HOOPER, 7, PALL MALL EAST, and 55, GROSVENOR-STREET.

**Mr. T. H. Wakley's Stricture Instru-**  
MENTS. Complete Sets of these Instruments may now be had of WEISS & SON, 62, Strand, London.

**Every excellence which the**

Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c.

H. and Co. have much pleasure in informing the Profession that they have perfected an ABDOMINAL BELT of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 18s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stocking: Circumference at A, B, C, D, and E; length from A to D, and D to E.

HUXLEY and CO., 8, Old Cavendish-street, late 5, Vere-street, Oxford-street.

**Huxley's Fulcrum**

ABDOMINAL BELT will be found, from its mechanical arrangement, (acting diagonally,) and producing the required support for the lower part of the Abdomen, to be the most complete and comfortable arrangement ever invented. It is extremely light, weighing only 4oz. Price 18s.

Measures required.—Circumference at A, B, and C; depth from A to C.

A discount of 20 per cent. to the profession.

HUXLEY and CO., 8, Old Cavendish-street, late 5, Vere-street, Oxford-street.

**Ladies' Belts.—Bailey's**

ELASTIC LADIES' BELTS are found to be some of the most useful articles in his establishment. They are worn by those who are delicate in constitution, as they support the Back and Abdominal Muscles, giving the greatest possible comfort before and after Accouchement. They are without Buckles or any innumbrances, and easily adjusted. Prices, 18s., 32s., and 42s.

Those without Elastic are much used by Surgeons for persons immediately after Accouchement, and called Bailey's Compressing Belts. Price 10s. 6d., 15s., and 25s.

Hospitals and Lying-in Institutions supplied.

Females in attendance, and private rooms for trying on.

Address, WM. HUNTLY BAILEY, 418, Oxford-street, London.

**Mr. Bourjeaud's Registered Elastic**

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

**FIG. 1. THE THIGH AND KNEE-PIECE.**—Mr. Bourjeaud begs to state that these are combined to answer certain purposes of compression when oedema or distension of the thigh and knee exist together.

**FIG. 2. SPIRAL STOCKING MADE TO FIT FROM THE TOES TO ABOVE THE KNEES.**—This appliance is one of the most valuable, and gives such support to the whole limb that the venous blood is returned with great ease. Patients affected with varicose veins should generally resort to this stocking, which, like the other appliances, is made of varying compressing force to suit every shade of difference among patients. All the above spiral apparatuses may be put on with the greatest ease, as they will stretch to almost double the size, and the force is so managed that support is given without creating the least uneasiness.

## School of Anatomy and Medicine,

adjoining St. George's Hospital. The Introductory Lecture will be delivered by Dr. Lankester, on Monday, October 2nd, 1854.

Anatomy and Physiology—Dr. Lankester and Mr. Blenkins, assisted by Mr. Lane.  
Descriptive and Surgical Anatomy—Mr. Blenkins and Dr. Deville.  
Chemistry—Mr. J. E. D. Rodgers.  
Medicine—Dr. Cornack and Dr. Ballard.  
Surgery—Mr. Pilcher and Mr. Spencer Wells.  
Midwifery—Mr. Bloxam.  
Materia Medica—Dr. Ballard.  
Forensic Medicine—Dr. E. W. Richardson.  
Botany—Dr. Lankester.  
Practical Chemistry—Mr. J. E. D. Rodgers, and Dr. Marce.  
Comparative Anatomy and Zoology—Mr. R. T. Hume.

For further particulars and prospectuses, apply to Dr. Lankester, 22, Old Burlington-street; Mr. R. W. Burford, at the School, 1, Grosvenor-place; or at the residences of the respective Lecturers.

## King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1854-5, will Commence on Monday, October 2, 1854.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.  
Physiology and General and Morbid Anatomy—Professors W. Bowman, F.R.S., and Lionel S. Beale, M.B.  
Chemistry—Professor W. A. Miller, M.D., F.R.S.  
Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.  
Principles and Practice of Surgery—Professor William Ferguson, F.R.S.  
Logic and Natural Philosophy, as required by the Army Medical Board.

### KING'S COLLEGE HOSPITAL.

The new Out-patient Department, and a large portion of the new building, will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by Professors Partridge and Ferguson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience for the attainment of Practical Chemistry, and for the prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the new Winter Session will have the exclusive privilege of contending for three Warneford Scholarships of £25 per annum, for three years. The subjects for the examination, which will commence on September 30, are, Divinity, Classics, Mathematics, History, and Modern Languages, equal marks being assigned to each subject. The classical books used on by the examiners for this year are the same as those announced for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £30, and three of £20 each, tenable for two years, will be filled up in April next, the subjects of the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or upon application to J. W. Cunningham, Esq., Secretary.

June, 1854.

R. W. JELF, D.D., Principal.

## St. Thomas's Medical Session.—A

General Introductory Address will be delivered by SAMUEL SOLLY, F.R.S., on Monday, 2nd October, 1854, at Eight o'clock p.m.

Gentlemen have the option of paying £40 for the first year, a similar sum for the second, and £10 for each succeeding year; or £90 at one payment, as Perpetual.

### SCHOLARSHIPS AND PRIZES FOR 1854-55.

A Scholarship of £20 for the best voluntary Classical and Mathematical examination, at the commencement of the Student's Hospital attendance.

Two Scholarships, for first year's men, each of the value of £20.

The Two House-Surgeons, the Fifteen Dressers, and the Resident Accoucher, will be selected according to merit; and provided with Rooms and Commons in the Hospital, free of expense.

The President's Prizes. The first, 10 Guineas. The second, 5 Guineas. Prizes and Certificates of Honour, in each of the different Classes.

Mr. Newman Smith's Prize, £5. The Cheselden Medal, and Dr. Root's Prize, 10 Guineas.

The Treasurer's Prizes. The first, a Gold Medal. The second, 5 Guineas. And Three of 10 Guineas to Clinical Medical Clerks.

### MEDICAL OFFICERS.

Dr. Roots, Consulting Physician; Mr. Green, Consulting Surgeon; Dr. Barker, Dr. J. Risdon Bennett, Dr. Gooldeen, Mr. South, Mr. Mackmurdo, Mr. Solly, Mr. Le Gros Clark, Mr. Simon, Dr. Peacock, Dr. Bristowe, Dr. Waller, Mr. Whitfield.

A Systematic Course of Clinical Medicine, with Clinical Instruction in the Wards—Dr. Barker. Ophthalmic Surgery, Mr. Mackmurdo; Midwifery, Dr. Waller and Dr. Griffiths.

Medicine—Dr. J. Risdon Bennett.

Surgery—Mr. South.

Physiology—Mr. Grainger and Dr. Brinton.

Descriptive and Surgical Anatomy—Mr. Le Gros Clark and Mr. Rainey.

Chemistry and Practical Chemistry—Dr. Rt. Dundas Thomson.

Midwifery—Dr. Waller.

Practical Midwifery—Dr. Griffiths.

Diseases of the Teeth—Mr. E. Saunders.

General Pathology—Mr. Simon.

Botany—Dr. Bristowe.

Comparative Anatomy—Mr. Huxley.

Materia Medica—Dr. Peacock.

Forensic Medicine—Dr. Brinton.

Anatomical Demonstrations—Mr. Rainey, Mr. Barwell, and Mr. Jones.

Demonstrations in Morbid Anatomy—Dr. Bristowe and Mr. Jones.

Microscopical Demonstrations—Mr. Rainey.

To enter, or to obtain further information, apply to Mr. WHITEFIELD, Medical Secretary, resident at the Hospital.

## Guy's Pupils.—A Physician and

Teacher attached to Guy's Hospital receives into his house one or two PUPILS, whose Studies he would superintend. Gentlemen intending to Graduate at the University would be preferred.—For information, apply to the Librarian, at the Hospital.

## Medical College, Royal Free Hos-

PITAL.—During the WINTER SESSION, 1854-55, whilst this Institution is undergoing the alterations and extensions required by the Royal College of Surgeons,

PRIVATE COURSES OF PRACTICAL INSTRUCTION on ANATOMY and SURGERY will be given by Dr. KNOX (late Lecturer on Anatomy, Edinburgh), and by Mr. GANT, Co-Lecturers on Anatomy and Physiology.

Terms and any further particulars may be obtained on application at the Office of the College.

## Medical College, Royal Free Hos-

PITAL. The INTRODUCTORY LECTURE will be delivered by Dr. KNOX, "On the Life and the Labours of Bichat, the Discoverer of Human Descriptive Anatomy," on TUESDAY, October 3rd, at Three o'clock.

## Charing-cross Hospital Medical

SCHOOL, WEST STRAND, LONDON.

WINTER SESSION, October, 1854, to March, 1855.

Chemistry—H. H. Lewis, A.M.  
Anatomy—Mr. E. Canton.  
Demonstrations and Dissections—Mr. Goldbro.  
Surgery—Mr. Hancock.  
Physiology and Pathology—Dr. Hyde Salter.  
Medicine—Dr. Chowne and Dr. Rowland.

SUMMER SESSION, May, 1855, to the end of July.

Practical Chemistry in the Laboratory—H. Lewis, A.M.  
Materia Medica—Dr. Stegall and Dr. Willshire.  
Botany—F. W. Headland, B.A.  
Midwifery, &c.—Dr. Chowne and Mr. Hird.  
Medical Jurisprudence—Dr. G. Birkett and Mr. Hird.

All the Lectures required by the College of Surgeons and Society of Apothecaries, £45, without Practical Chemistry, which is £2 2s.

### HOSPITAL PRACTICE.

Consulting-Physician—W. Shearman, M.D.  
Physicians—Dr. Golding and Dr. Chowne.  
Assistant-Physician—Dr. Rowland.  
Surgeons—Mr. Hancock and Mr. Avery.  
Assistant-Surgeon—Mr. E. Canton.

MEDICAL PRACTICE.—Full period required, £15 15s. Surgical, £15 15s. Both Medical and Surgical, £26 5s.

JOHN ROBERTSON, Hon. Sec.

## St. Mary's Hospital and Medical

SCHOOL.—The WINTER SESSION will Commence on Monday, the 2nd of October, with an Introductory Address by Dr. ALDERSON, F.R.S., at Half-past Two o'clock.

### LECTURES.

Anatomy and Physiology—Mr. Lane and Dr. Handfield Jones.  
Descriptive and Surgical Anatomy—Mr. Haynes Walton and Mr. James Lane.  
Pathological Anatomy—Dr. Markham.  
Chemistry—Dr. Albert J. Bernays.  
Medicine—Dr. Chambers and Dr. Gibson.  
Surgery—Mr. Coulson and Mr. Spencer Smith.  
Clinical Medicine—Dr. Alderson.  
Clinical Surgery—Mr. Ure.

SUMMER SESSION, 1855, commencing May 1st.

Botany—Dr. J. S. Burdon Sanderson.  
Materia Medica—Dr. Hoveking.  
Practical Chemistry—Dr. Albert J. Bernays.  
Midwifery, &c.—Dr. Tyler Smith and Mr. I. Baker Brown.  
Medical Jurisprudence—Mr. Ansell.  
Military Surgery—Dr. James Bird, F.R.C.S.E.  
Ophthalmic Surgery—Mr. White Cooper.  
Aural Surgery—Mr. Toynbee.  
Dental Surgery—Mr. Nasmyth.  
Comparative Anatomy—  
Natural Philosophy—Mr. Lindsay Blyth.

HOSPITAL PRACTICE.—The hospital contains upwards of 150 beds, 65 of which are devoted to Medical, and the rest to Surgical, cases. This division includes a ward appropriated to the Diseases of Women, and also beds for Ophthalmic and Aural cases. A Maternity Department is attached to the hospital: 218 poor married women were delivered at their own homes during the past year. The In-patients are visited daily by the Physicians and Surgeons at one o'clock. Lectures on Clinical Medicine will be regularly delivered by Dr. Alderson, and on Clinical Surgery, by Mr. Ure; and occasionally by the other Medical Officers in their respective departments. The Out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

There are three Resident Medical Officers, who board in the hospital, and are appointed for eighteen months; two non-resident Medical Officers; a Medical and a Surgical Registrar. Clinical Clerks and Dressers will be selected from the best-qualified Students. All the above offices are open to competition amongst the qualified Perpetual Pupils of the hospital, without extra fee.

Further information may be obtained on application to the Dean of the School, who will also furnish the names of gentlemen in practice in the vicinity of the hospital, willing to receive Pupils to reside with them.

St. Mary's Hospital,  
Aug. 8th, 1854.

H. SPENCER SMITH,  
Dean of the School.

**House-Pupil.—Dr. Steggall will have**  
a Vacancy for a RESIDENT PUPIL in October next. Unusual advantages and assistance will be afforded for Study and Improvement.—For terms apply to Dr. S., 2, Southampton-street, Bloomsbury-square, London.

**Mr. G. Hind, F.R.C.S., resumed his**  
DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.  
Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

**The City and Borough Hospitals.—**  
A Hospital Physician, possessing ample means of instruction, who is acquainted by personal experience with the requirements of all the London Examining Boards, including the University of London, and whose residence is most conveniently situated in reference to the City and Borough Hospitals, has a Vacancy for a PUPIL.—For terms, &c., apply to Dr. Barnes, 13, Devonshire-square.

**Private Medical Tuition.—**  
A Physician of a practical and scientific reputation, residing near Russell-square, receives HOUSE-PUPILS, as well as others, whose Medical Education, in all its branches, will be carefully and privately instructed by teachers of great experience and acknowledged ability. As a private Medical School, this establishment offers unequalled facilities for enabling Medical Students to undergo the requisite Medical, Surgical, and Chemical Examinations at the different Boards. The Students may be instructed singly or in classes, as they may prefer.—Apply to THE LANCET Office.  
N.B. A Chemical Laboratory on the Premises.

**Mr. Power and Dr. Power continue,**  
daily, their LECTURES and EXAMINATIONS, preparatory for the Colleges of Physicians and Surgeons, the Scotch Universities, the Apothecaries' Hall, and the Army, Navy, and East India Boards.  
Mr. Power receives, privately, at his own residence, Practitioners preparing for the Degree of M.D. or College of Physicians; he also prepares by correspondence. Dr. Power receives two House Pupils.  
Lecture-room, Exeter-hall, Strand.

**Kelvedon School, Essex.**  
Conducted by Mr. W. WISEMAN, M.C.P.  
The Studies of Young Gentlemen intended for the Medical Profession are so arranged at this Establishment as to qualify them, on leaving, for passing the Preliminary Examination at the University of London or Apothecaries' Hall.  
Terms, from Thirty Guineas to Fifty Guineas per annum, according to the accommodation, &c., required.

**Chemical School.—The Chemical**  
SCHOOL of the ROYAL PANOPTICON, Leicester-square, will RE-OPEN, under the superintendence of Mr. G. F. ANGELL, on the 2nd of October next. The arrangements are made with a view to give every facility for the prosecution of studies and investigation, and to consult the convenience of persons who can command only a portion of their time. For further particulars and terms, apply at the Office of the Institution, between the hours of ten and five.

**Leeds School of Medicine.**  
TWENTY-FOURTH SESSION.  
The WINTER SESSION will Commence on Monday, October 2nd, 1854, when J. T. IKIN, F.R.C.S., President, will deliver the Introductory Lecture, at Twelve o'clock.  
Anatomy, Physiology, and Pathology.—Mr. Ikin, Mr. S. Hey, Mr. Wm. Nicholson Price, and Mr. C. G. Wheelhouse.  
Descriptive Anatomy.—Mr. Wm. Nicholson Price, and Mr. C. G. Wheelhouse.  
Principles and Practice of Surgery.—Mr. Hey and Mr. Nunneley.  
Chemistry.—Mr. Morley and Mr. Scattergood.  
Principles and Practice of Physic.—Dr. Chadwick and Dr. Heaton.  
Superintendent of Dissections.—Mr. E. W. Ward.

SUMMER SESSION, 1855, Commencing May 1st.  
Materia Medica and Therapeutics.—Mr. Bishop.  
Midwifery and Diseases of Women and Children.—Mr. Smith and Mr. Brathwaite.  
Forensic Medicine.—Dr. Pyemont Smith.  
Botany.—Dr. Heaton.  
Practical Chemistry.—Mr. Scattergood.  
Operative Surgery.—  
\* \* Application for Tickets may be made to the Treasurer, Mr. Samuel Hey, Albion-place.

N.B.—Attendance at the above Lectures will confer the same Qualification for Examination as is obtained in the Medical Schools of London.  
Clinical Lectures will be given at the General Infirmary on Medical Cases, by Dr. Chadwick and Dr. Heaton; on Surgical Cases, at the General Infirmary, by Mr. Smith, Mr. T. F. Teale, and Mr. Samuel Hey; on Ophthalmic and Aural Practice, at the Eye and Ear Infirmary, by Mr. Nunneley. Medical Libraries are connected both with the School and the Infirmary.

**Matrimonial Institution.—Founded**  
1805.—Offices: 13, John-street, Adelphi, London; and 19, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.  
Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CUTZBURG, 13, John-street, Adelphi, London.

**Marischal College and University.—**  
(Charter ratified by Act of Parliament, A.D. 1526).—FACULTY OF MEDICINE.—WINTER SESSION of 1854-55 commences on the first Monday of November.

CLASSES.  
Anatomy.—Professor A. J. Lizars. 12 noon.  
Practical Anatomy and Anatomical Demonstrations.—Professor A. J. Lizars and Dr. Beveridge. 2 P.M.  
Chemistry.—Dr. Clark, Mr. Brander (Assistant). 3 P.M.  
Practical Chemistry.—Dr. Clark and Mr. Brander. 11 A.M.  
Materia Medica.—Dr. Henderson. 9 A.M.  
Institutes of Medicine.—Dr. Ogilvie. 4 P.M.  
Practice of Medicine.—Dr. Macrobain. 3 P.M.  
Principles and Practice of Surgery.—Professor Pirrie. 1 P.M.  
Midwifery, and Diseases of Women and Children.—Dr. Dyce. 4 P.M.  
Natural History.—Professor Nicol. 11 A.M.

The SUMMER SESSION of three months' duration commences in May. Hospital Practice daily at 10 A.M., at the Royal Infirmary, containing upwards of 250 beds.  
Fee, £5 5s., to be paid in one, or in separate payments of £2 2s. at the commencement of each Session.

The Courses at this University qualify for Examination at the several Universities, Colleges of Surgeons, and Boards of the Public Services, and at Apothecaries' Hall.

Graduates who have attended the several Medical Classes in this University are charged no Graduation Fees.

The Examination Term will be held in the third week of October.

For particulars, in the case both of students and practitioners, application may be made to the Secretary of the University.

**Queen's College, Cork.**  
SESSIONS 1854-1855.

MATRICULATION and SCHOLARSHIP EXAMINATIONS.  
On Tuesday, the 17th of October next, at Ten o'clock A.M., an Examination will be held for the Matriculation of Students in the Faculties of Arts, Medicine, and Law, and in the Departments of Civil Engineering and Agriculture.

The Examinations for Scholarships will commence on Tuesday, 17th October. The Council have the power of conferring at these Examinations Ten Senior Scholarships of the value of £30 each—viz., Seven in the Faculty of Arts, Two in the Faculty of Medicine, and One in the Faculty of Law; and Forty-five Junior Scholarships—viz., Fifteen in Literature, and Fifteen in Science, of the value of £25 each; Six in Medicine, Three in Law, and Two in Civil Engineering, of the value of £20 each; and Four in Agriculture, of the value of £15 each.

Prospectuses, containing full information as to the subjects of the Examinations, &c., may be had on application to the Registrar.

By order of the President,  
Sept. 8th, 1854. ROBT. J. KERRY, Registrar.

**Queen's University.—Queen's Col-**

LEGE, CORK.  
President.—Sir R. Kane, M.D., F.R.S.  
Vice-President.—John Eyal, LL.D.  
FACULTY OF MEDICINE.  
Session 1854-55.  
Dean of Faculty.—Alexander Fleming, M.D.

PROFESSORS.  
Anatomy and Physiology } Joseph Corbett, M.D.

Modern Languages.—R. de Vericour, Des L.

Clinical Medicine and Clinical Surgery, at the North and South Infirmarys, by the Physicians and Surgeons of these Institutions. Clinical Midwifery, at the Lying-in Hospital.

The Medical Session will be opened on Monday, 30th October, 1854, at Two o'clock, by an Address from the Dean, and on the following day the Courses of Lectures will commence as under:—

ANATOMY and PHYSIOLOGY.—Tuesday, 31st October, at One o'clock, to be continued daily, except on Saturdays, at the same hour.

The PRACTICAL ANATOMY will be conducted by the Professor of Anatomy and Physiology and a Demonstrator. The Course will be opened for Dissections on the 17th October, and the DEMONSTRATIONS will commence on Thursday, 2nd November, and be continued daily at Twelve o'clock, except Saturdays.

MATERIA MEDICA.—Thursday, 2nd November, at Two o'clock, to be continued on Tuesdays, Thursdays, and Fridays, at the same hour.

PRACTICE OF MEDICINE.—Thursday, 2nd November, at Three o'clock, to be continued on Tuesdays and Thursdays, at the same hour, and on Saturdays, at One o'clock.

PRACTICE OF SURGERY.—Wednesday, 1st November, at Three o'clock, to be continued on Mondays, Wednesdays, and Fridays, at the same hour.

MIDWIFERY.—Wednesday, 1st November, at Four o'clock, to be continued on Mondays, Wednesdays, and Fridays, at the same hour.

Eight Scholarships will be awarded to Students in Medicine, thus—Six Junior Scholarships of £30 each to Students commencing their first, second, and third year, two to each year; and two Senior Scholarships of £40 each to Students commencing their fourth year.

Those Fees hitherto payable by Matriculated Students on behalf of the College for incidental expenses being now, in part, provided for by public grants, shall henceforth be reduced for each such Student from £3 to 10s. for Matriculation and first year, and from £2 to 5s. for the second and subsequent years.

By order of the President,  
ROBT. J. KERRY, Registrar.  
Queen's College, Cork, September 6th, 1854.

## Royal Cornwall Infirmary.—Notice

is hereby given, that a RESIDENT HOUSE-SURGEON is required for the Royal Cornwall Infirmary, at a salary of £150 per annum, without board. A Dispenser will be provided to assist in the general business of the Surgery. Applications, accompanied by testimonials, to be addressed to the "Chairman of the Weekly Committee," at the Infirmary, on or before the 14th of October next; and the Election will take place on the 23rd of October, 1864. The number of Beds is 55.

Truro, September 13th, 1864.

## House-Surgeon to an Infirmary.—

Wanted, by an M.R.C.S. England, the above Situation. He has the diploma of the Rotunda Lying-in Hospital, Dublin, in which he officiated as House-surgeon; understands the Compounding of Medicine, having been Pupil to an Hospital Apothecary for several years. Can make Casts, moist and dry Preparations, either Surgical or Anatomical, having filled the Office of Curator and Prosecutor to one of the first Medical Schools in Dublin for some years. He will produce certificates for the above if required.—Address, post-paid, to Medicus, 14, Cambray, Cheltenham.

## Leeds Public Dispensary.—

Mr. Sparrow having resigned his Office of APOTHECARY to this Institution, the Medical Officers will elect his Successor on Monday, Oct. 9th. No one will be eligible for the appointment who is not a Licentiate of the Apothecaries' Company. Salary, £120 per annum, with a furnished house, coals, and candles.

By direction of the Committee, a preference will be given to a married man whose wife would be willing to take the general management of the house; or to an unmarried man having an elderly relative who would undertake the same duties.

Candidates for the Situation are required to present themselves, with their testimonials, at the Dispensary, on Thursday, October 5th, at Twelve o'clock; and the Medical Officers will proceed to the Election on the Monday following.

Further information may be obtained on application to Mr. C. G. Wheelhouse, Surgeon, 16, East Parade, Leeds.

Leeds, September 8th, 1864.

Two RESIDENT ASSISTANT APOTHECARIES are also wanted for this Institution, who will have permission to attend a limited number of Lectures at the Leeds School of Medicine.—Testimonials to be forwarded as above.

### TO THE MEDICAL PROFESSION.

## Alderbury Union.—The Guardians

of this Union are desirous of receiving applications from Medical Gentlemen (duly qualified in accordance with the General Order of the Poor-law Board) to undertake the Medical and Surgical Attendance on the Poor of the Parishes of Winterslow and Piton and Farley; population in 1851, 1626. Salary £20 per annum, together with such fees for Vaccination as are fixed by the Vaccination Act, and 10s. 6d. for each ordinary case of Midwifery; and for the treatment of Surgical cases, as well as extraordinary cases of Midwifery, such fees as by the General Orders of the Poor-law Board are allowed.

All applications to be forwarded to the Clerk on or before Thursday, the 28th instant, with a statement in writing of the Candidate's qualification.

The Election will take place at the Board-room, in the Workhouse, on Friday, the 29th instant, at Eleven o'clock in the forenoon, when the personal attendance of the Candidates will be required.

The Guardians will require two month's notice of intended resignation of office. By order of the Board, Bedwin-street, Salisbury, Sept. 15th, 1864. THOMAS JESSE, Clerk.

## A Course of Instruction on the

THEORY AND PRACTICE OF MEDICAL GYMNASTICS will be commenced, at the Institution, 18A, Old Cavendish-street, by Dr. ROTH, on Monday, the 2nd of October, at 6 P.M., and continued every Monday and Friday, during the months of October, November, and December.

This Course is open to all Medical Students and Professional Men. Terms, Five Guineas.

### DR. ROTH'S WORKS ON MEDICAL AND EDUCATIONAL GYMNASTICS.

1. THE PREVENTION AND CURE OF MANY CHRONIC DISEASES BY MOVEMENTS. With Ninety Illustrations. Price 10s.

London: John Churchill, New Burlington-street.

2. ON THE IMPORTANCE OF RATIONAL GYMNASTICS. Price 1s.

3. THE GYMNASTIC FREE EXERCISES OF TRING. Price 2s. 6d.

4. MOVEMENTS for the DEVELOPMENT of the BODY in CHILDHOOD and YOUTH. Price 1s.

5. THREE SHEET TABLES, ILLUSTRATING GYMNASTIC EXERCISES WITHOUT APPARATUS.

In the Press,

NOTES on the SWEDISH MEDICAL GYMNASTICS. With 120 Engravings.

Groombridge and Sons, 5, Paternoster-row.

## A New Discovery.—Mr. Howard,

Surgeon-Dentist, 53, Fleet-street, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without springs, wires, or ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR OR DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed teeth rendered sound and useful in mastication.

53, Fleet-street. At home from Ten till Five.

### TO THE PROFESSION.

Mr. Bowmer, M.R.C.S. Eng., 50, LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, *free of expense*. Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

## Death Vacancy.—For immediate

Disposal, in consequence of the sudden death of a Surgeon, a Country PRACTICE, returning between £400 and £500 per annum. Part of the Purchase-money may be paid out of the receipts. Rent of house and garden, with stabling and paddock, under £30.—Apply to Mr. BOWMER, 50, Lincoln's-inn-fields.

### TO PUPILS ABOUT TO ATTEND ST. GEORGE'S OR ST. MARY'S HOSPITALS.

A Surgeon living close to Hyde-park, can receive two gentlemen to reside in his house, where they will enjoy unusual advantages for prosecuting their Studies, combined with the greatest domestic comfort.—Address to M. B., Marshall's Library, 21, Edgeware-road.

### TO MEDICAL STUDENTS AND OTHERS.

## Apartment furnished, with attend-

ance, in the house of a professional gentleman, in a central and agreeable part of London, close to the British Museum, and less than half-a-mile from the Middlesex, University College, Charing-cross, and King's College Hospitals. Terms average £1 per floor weekly; single rooms, 10s.—Address, 13, Caroline-street, Bedford-square.

### TO DENTISTS.

## The Advertiser, a first-rate Mechanic-

cal Dentist of fifteen years' experience in every branch of Dentistry, begs to inform Members of the Profession that he has every convenience for executing Artificial Work (supplying Materials if required) to any extent, in the best manner, on the shortest notice, and moderate terms.—For particulars address, A. B., 52, Upper George-street, Bryanston-square.

## To Medical Men of Capital.—The

Inventor and Patentee of a new but not secret Medical Remedy, the very superior merits of which may be easily and at once ascertained, is desirous of meeting with a Medical Gentleman who would take a share in the Invention, with a view to promote its speedy and general introduction into the Hospitals and among professional men. The sale augurs exceedingly well already, and, with the assistance looked for, it must in less than a year become all but unlimited. Capital wanted, £1000, for which either a share in the Patent for fourteen years and in the profits, or, if so preferred, ample security in goods, &c., and a good per centage, would be given, besides a bonus on the profits, which are very considerable. First-class references given and required.—Apply to A. O., at Mr. Taylor's, 33, Great Castle-street, Regent-street.

### TO THE MEDICAL PROFESSION.

## A Vacancy for a Surgeon having

occurred in the Honorary Medical Staff of the Farringdon General Dispensary and Lying-in Charity, the Committee of Management will meet at the Institution, 17, Bartlett's-buildings, Holborn, on Tuesday, the 26th of September, at Seven o'clock in the Evening, to fill up such Vacancy. Gentlemen willing to become Candidates (must be Members of the Royal College of Surgeons of England, and not practise Midwifery or Pharmacy) are requested to forward their testimonials to the Secretary, on or before the 26th of September.

St. Sepulchre's Church Porch, Snowhill.

S. J. JOYNS, Hon. Sec.

## Mr. Edward Bayley, Surgeon, of

Chesham-street, Salop, lately deceased, having left a Widow and three young Children wholly unprovided for, a few Medical Men, well-wishers of the Family, are desirous to raise a Subscription for their benefit by a Public Appeal to the sympathy and support of the Profession, and of such Friends as shall feel disposed to aid the cause of the Fatherless and Widow.

Subscriptions will be thankfully received by Messrs. Saxton, Brothers, Market Drayton.

References are permitted to—

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1838.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.

Office hours from 12 till 4.

**Lunatic Asylum.—£1000 may** remain on security of the property.—For SALE, the Goodwill and Lease, with necessary fixtures and furniture, of an Establishment licensed for the reception of both sexes, and of excellent repute. It may be reached in three hours from London. The net income is £800 per annum, and is capable of great and immediate increase. Purchase-money for everything, as it is, between £2000 and £3000.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**Price only 300 Guineas, a General PRACTICE,** well established in a pleasant and thriving West-end neighbourhood, and returning nearly £400 a year: there is an Open Surgery, but Retail business has not been sought; an Introduction will be given to suit a Purchaser's views. The house is good, on lease at a low rent, and nearly the whole is let off by the Vendor, who is unmarried.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**A General Fee-Practice, well estab-**lished in a western market town, the centre of a wealthy and delightful neighbourhood, can be Transferred to a Gentleman of good address, and not under thirty years of age, by a Partnership Introduction till Lady-day. Receipts average over £400 per annum; premium, including lease of capital House, 400 guineas: Rent £40.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**Death Vacancy, suitable to a well-**qualified young Surgeon without Family. The Practice has been conducted through a Retail, in Soho. There are nearly 300 names in the Ledger, and the whole will be Sold, including excellent Stock and Fixtures, for the benefit of the Widow, for £130 cash. An immediate Purchaser will obtain the Transfer of a good and rapidly-increasing Connexion.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**In a large, healthy, and pleasant** town, easily reached from London, a GENERAL PRACTICE of over £800 a year, is for Disposal. Terms to depend on introduction required; for two months, £300 cash will be accepted. The vendor, who has been nearly twenty years in practice, is retiring.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**Near Pimlico and Hyde-park.—A** good and increasing GENERAL PRACTICE, yielding between £500 and £800 a year, and offering every facility for forming a first-class Connexion, may be Purchased, with the necessary Introduction, for £800; receipts from the day of entry. Rent, taxes, and gas, £250 per annum, of which £155 can be let off during the season, without discount.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

MEDICAL.

**A Gentleman, about thirty, M.D.** and M.R.C.S. Eng. is open to Engagement with any Gentleman requiring the services of such.—Address, Ictossa, 49, Strand.

**Wanted by a General Practitioner,** an ASSISTANT to Dispense, occasionally Visit and attend Midwifery.—Apply, by letter, to M.D., THE LANCET Office, 423, Strand, stating age and salary required.

**Wanted, by a General Practitioner,** an ASSISTANT, to Dispense, occasionally Visit, and attend Midwifery.—Apply, by letter, to Medicus, 2, Charlotte-row, Walworth-road, stating age, qualifications, and salary required.

**Wanted, a gentlemanly and qualified** ASSISTANT; he will have a comfortable home, and plenty of time for reading, and use of library and good microscope.—Address, Robert Knaggs, Swindon, Wilts.

**Wanted immediately, a qualified** Medical Gentleman to act as a Dispensing ASSISTANT to a highly respectable Country Practice, and also in some degree to take charge thereof. Apply to J. Burns, Esq., Surgeon, Black How, Whitehaven, Cumberland.

**Wanted, by a General Practitioner** in the Country, a Dispensing ASSISTANT, competent to attend a case of Midwifery.—Letters, post paid, addressed to Messrs. Gale, Baker, Wardle, and Oldfield, Wholesale Chemists, Bouverie-street, Fleet-street, London.

**Wanted, by a Surgeon in the West** of England, an out-door ASSISTANT, with at least one qualification, to Visit, Dispense, and attend Midwifery, married, and of the Established Church. Address, stating age and salary required, to J. T., Mr. Woodwells, 62, Berners-street, Oxford-street, London.

TO PHYSICIANS.

**A Physician who has practised very** many years in the South of England, is willing to Retire. About £1000 required to enter upon the Succession.—Apply (giving references) to M. D., care of Mr. ORRIDGE, 30, Bucklersbury.

**First class Practice required.—A** Gentleman possessed of competent means wishes to Purchase a SHARE in (or the SUCCESSION to) a GENERAL PRACTICE of the best class, in or near London, or some desirable provincial Town. The Advertiser can offer references of the highest respectability. He is about thirty years of age. Further particulars on application to F.R.C.S., care of Mr. ORRIDGE, 30, Bucklersbury.

**Partnership in London.—A Prac-**titioner, who has an old established and lucrative Chemist's Business in conjunction with his Practice, wishes for a PARTNER. The situation is in a very desirable part of the West-end of Town. The returns very considerable. Premium, £800.—Apply to Mr. ORRIDGE, 30, Bucklersbury, London.

MEDICAL.

**Four to Five Hundred per Annum.** A GENERAL PRACTICE in a desirable locality in the West of England is transferable upon easy terms, with a competent Introduction. The Business includes about £100 yearly from an Appointment. The residence is modern, with Stablers, Coach House, Orchard, and excellent Garden. There is a public School near.—Apply to H. W., care of Mr. ORRIDGE, 30, Bucklersbury.

**To be disposed of immediately, in** Cornwall, a small but old established PRACTICE, with a valuable Union Appointment attached.—Apply to A.B., 199, Fleet-street, London.

**Medical Assistant required in the** Country, about forty miles from London, duties light, one qualification necessary, and acquaintance with Union Practice desirable.—Address, with terms, M. D., Aspley, Woburn Beds.

**In an Establishment three miles** west of London, YOUNG LADIES are RECEIVED to BOARD and EDUCATE, at 30, 35, and 40 guineas per annum, inclusive terms. A garden of nearly two acres in extent.—For prospectuses, address M. X., Barker's Library, Dorcas-terrace, Hammersmith.

**Any Gentleman having a Practice** or PARTNERSHIP to Dispose of in the Country, and willing to receive payment by Annual Instalments, may hear of an immediate Purchaser, married, fully qualified, and of incontestable respectability. Address, Medicus, 78, Theobald's-road, Red Lion square, London.

**Wanted, an Assistant, to Visit, Dis-**pense, and attend Midwifery. He must be a Member of one of the Royal Colleges of Surgeons, and belonging to the Church of England. He will live with, and be treated as one of the family.—Apply to Mr. Wood, Surgeon, Oxford.

MEDICAL.

**Wanted, by a Medical Gentleman,** age Thirty-five, a Situation as out-door Visiting and Dispensing ASSISTANT, in town or country. Has had great experience in town and country Practice, Midwifery, &c., and can produce high testimonials. Address, M. D., 129, Windmill-street, Gravesend.

**Wanted, a Situation to Dispense** and Visit occasionally, by a Young Man who has had seven years' experience in Prescribing and Dispensing. The Advertiser understands Poor-law Practice, if required, can give unexceptionable references, and has no objection to the country.—Address B., care of Mr. Duve, 37, Maddox-street, Regent-street, London.

**An Assistant wanted by a Prac-**titioner in a small market town not far from London, to Visit, Dispense, and Attend a moderate share of Midwifery; to be of an age from 21 to 30, and possessing the double qualification. The Salary, £50 a year.—Apply by letter, stating age, reference, and qualifications, to B. C., at Messrs. Howes and Co., 7, Thavies-inn, Holborn-hill.

TO SURGEONS, &c.

**To be disposed of, a small but select** and well-established Country PRACTICE in Berkshire, returns about £300, including £30 from Clubs. Excellent house, rent moderate. So good an opportunity for making an extensive Practice is seldom to be met with. Price, £200.—Apply to A. B., care of Mr. Gordon, 17, Hemingford-cottages, Richmond-road, Islington, London.

**Insanity and Nervousness.—In a** small Establishment, conducted by a Lady, two or three PATIENTS can be RECEIVED on very moderate terms. Every possible care, attention, and kindness, is observed, and the fullest confidence may be placed in the advertiser. References of the first respectability will be offered.—Apply by letter, or personally, to Miss Lush, York House, Battersea, Surrey.

TO MEDICAL STUDENTS.

**Apartment, with or without board,** in the House of a Medical Man, situated within five minutes' walk, of the London University College.—Address, A. B., 19, Grafton-street, Fitzroy-square.

# DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,  
AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM,  
AND ALL SCROFULOUS DISEASES.

Approved of and recommended by **BERZELIUS, LIEBIG, WOEHLER,**  
**JONATHAN PEREIRA, FOUQUIER,** and numerous other distinguished scientific Chemists.

Prescribed by the most eminent Physicians, and supplied to the leading Hospitals of Europe.

Specially rewarded with Medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—  
effecting a cure or alleviating symptoms much more rapidly.

Contains iodine, phosphate of lime, volatile acid, and the elements of the bile—in short, all its most active and essential  
principles—in larger quantities than the Pale Oils made in England and Newfoundland, deprived mainly of these by their  
mode of preparation.

*The following Extracts are selected from some of the leading Medical and Scientific Testimonials in favour of*

*DR. DE JONGH'S COD-LIVER OIL:—*

**BARON LIEBIG,**

Professor of Chemistry at the University of Giessen, &c. &c.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use."

The late

**DR. JONATHAN PEREIRA,**

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

**DR. FOUQUIER,**

Professor at the University of Paris, Physician to his late Majesty Louis Philippe, &c. &c.

"You have preserved to science the use of a medicine that might have fallen into utter discredit, in consequence of its unaccountable inaction in some cases."

**DR. E. RIEGEL,**

Of Carlsruhe, Grand Duchy of Baden.

"This analysis has convinced me that Dr. de Jongh's Oil is not only prepared with greater care than the ordinary Cod-liver Oil, but that it contains in larger quantities those principles which are generally admitted to be most active and essential, so that it ought to be considered the most efficacious kind."

**DR. SEGNITZ,**

Of Gelnhausen, Duchy of Hessen.

"I am bound to state that this Oil is greatly superior to all other kinds previously used by me, and that, therefore, the object aimed at by the use of this remedy is more surely attained by this Oil than by any other kind."

The

**INTENDANT OF THE CIVIL LIST OF BELGIUM.**

"The King has charged me to return you his very particular thanks for the homage done to him, by the presentation of your most valuable researches concerning the Cod-liver Oil: as an expression of his utmost satisfaction, he has given me the order of presenting you with the accompanying large Gold Medal."

**DR. VAN DEN HUYDEN,**

Emmerich.

"I CAN conscientiously recommend it to my colleagues as being superior to all other kinds."

The

**MINISTER OF THE INTERIOR OF HOLLAND.**

"I HAVE the honour of bringing to your knowledge, that it has pleased the King to grant you, by his Decree of the 20th January, 1848, No. 101, a Silver Medal with an appropriate honorary inscription, as a testimony of his Majesty's high approbation for your efforts in securing to this country a supply of the most efficacious Cod-liver Oil from Norway. I have given the necessary orders for the execution of this Medal."

**THE ROYAL POLICE OF PRUSSIA.**

"THE Royal Police of Prussia (Königliches-Polizei-Praesidium) has the honour of informing you that it has caused the sample which you have forwarded to be submitted to an official investigation, and that the result of such investigation has proved it to be not only the genuine Cod-liver Oil, but still further, that it is of a kind which distinguishes itself from the Cod-liver Oil in ordinary use, alike by its taste and chemical composition."

**"THE LANCET,"**

(July 29th, 1854.)

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. IN THE PREFERENCE OF THE LIGHT-BROWN OVER THE PALE OIL WE FULLY CONCUR."

"WE HAVE CAREFULLY TESTED A SPECIMEN OF THE LIGHT-BROWN COD-LIVER OIL, PREPARED FOR MEDICAL USE UNDER THE DIRECTION OF DR. DE JONGH, AND OBTAINED FROM THE WHOLESALE AGENTS, MESSRS. ANSAR, HARFORD, AND CO., 77, STRAND. WE FIND IT TO BE GENUINE, AND RICH IN IODINE AND THE ELEMENTS OF BILE."

**"THE MEDICAL TIMES,"**

(August 5th, 1854.)

"We believe that the profession are much indebted to Dr. de Jongh for his laborious researches into the composition and properties of this Oil; and we have the high authority of Baron Liebig and the late Dr. Pereira, in testimony of the value of these labours. In his zeal for investigating the properties of the Oil, Dr. de Jongh made a journey to Norway, and carefully examined its varieties, its mode of preparation, and its adulterations."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S Stamp and Signature, by

**ANSAR, HARFORD, & CO., 77, STRAND, LONDON,**

Sole Consignees and Agents for the United Kingdom and British Possessions, at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... 4s. 9d. | QUARTS ... 9s.

**IMPERIAL MEASURE.**

\*. Hospitals and other Charitable Institutions requiring large quantities may be supplied on considerably reduced terms.

PRINTED by THOMAS CHOATE SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CHURCHILL, of No. 423, Strand, in the parish of St. Martin-in-the-Fields, Westminster in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and Newsvendors in Great Britain and Ireland and the Colonies.—  
Saturday, September 23, 1854.

## NEW EDITIONS OF THE FOLLOWING MANUALS.

### THE ANATOMIST'S VADE-MECUM;

A SYSTEM OF HUMAN ANATOMY.

With numerous Illustrations on Wood.

By ERASMUS WILSON, F.R.S.

Fifth Edition. Fcp. 8vo, cloth, 12s. 6d.

Making 15,000 Copies.

### FOWNES' MANUAL OF CHEMISTRY.

With numerous Illustrations on Wood.

EDITED BY

H. BENICE JONES, M.D., F.R.S.,

AND

A. W. HOFMANN, F.R.S.

Fifth Edition. Foolscap 8vo, cloth, 12s. 6d.

Making 13,000 Copies.

### ELEMENTS OF NATURAL PHILOSOPHY.

BEING AN EXPERIMENTAL INTRODUCTION TO THE STUDY OF THE PHYSICAL SCIENCES.

With numerous Illustrations on Wood.

By GOLDING BIRD, M.D., F.R.S.,

AND

CHARLES BROOKE, M.B. CANTAB., F.R.S.

Fourth Edition. Fcp. 8vo, cloth, 12s. 6d.

Making 6250 Copies.

LONDON:

JOHN CHURCHILL, NEW BURLINGTON STREET.  
No. 1622.

## CHEMISTRY AND NATURAL PHILOSOPHY TEXT-BOOKS.

**Liebig's Handbook of Organic ANALYSIS.** Edited by Dr. HOFMANN. Large 12mo, with eighty-five Illustrations, 6s., cloth.

**WOHLER'S HANDBOOK OF INORGANIC ANALYSIS.** Edited by Dr. HOFMANN. Large 12mo, 6s. 6d., cloth.

**GREGORY'S HANDBOOK OF INORGANIC CHEMISTRY.** For the use of Students. Large 12mo, with Illustrations, 5s. 6d., cloth.

**GREGORY'S HANDBOOK OF ORGANIC CHEMISTRY.** For the use of Students. Large 12mo, 9s. 6d., cloth.

**LARDNER'S HANDBOOK OF NATURAL PHILOSOPHY AND ASTRONOMY.**

**FIRST COURSE.**—Mechanics—Hydrostatics—Hydraulics—Pneumatics—Sound—Optics. With 400 Woodcuts. Large 12mo, cloth, 12s. 6d.

**SECOND COURSE.**—Heat—Common Electricity—Magnetism—Voltaic Electricity. With 200 Woodcuts. Large 12mo, cloth, 9s. 6d.

**THIRD COURSE.**—Astronomy and Meteorology. With many Illustrations. Large 12mo, 16s. 6d.

**LIEBIG'S FAMILIAR LETTERS ON CHEMISTRY:** in its Relations to Physiology, Dietetics, Agriculture, Commerce, and Political Economy. Cheap Edition. One vol. fcap. 8vo, price 6s., cloth.

**LIEBIG'S AGRICULTURAL CHEMISTRY.** Fourth Edition, revised. 8vo, 6s. 6d., cloth.

**LIEBIG'S ANIMAL CHEMISTRY; OR, CHEMISTRY in its APPLICATIONS to PHYSIOLOGY and PATHOLOGY.** Third Edition. 8vo, Part I., 6s. 6d., cloth.

**MOHR AND REDWOOD'S PRACTICAL PHARMACY.** 8vo, 400 Cuts, 6s. 6d.

**PARNELL'S CHEMICAL ANALYSIS.** Second Edition. 8vo, 9s.

**WILL'S GIESSEN OUTLINES OF ANALYSIS.** 8vo, 6s.

**TURNER'S CHEMISTRY.** Eighth Edition. One vol. 8vo, 21 10s.

London: WALTON and MABERLY, Booksellers and Publishers to University College, 28, Upper Gower-street and 27, Ivy-lane.

**Pharmacopœia.—A New Translation** of the last LONDON; to which is added the DOSES and PROPERTIES of MEDICINES, with the LATIN NAMES, &c. 12mo, cloth, 1s. Reeves and Turner, 114, Chancery-lane.

Now ready, price 5s. 6d., or free, by post, to any part of the United Kingdom, price 6s., Fourth Edition, greatly enlarged and improved,

**A Grammatical Introduction to the LONDON PHARMACOPEIA, and a KEY to PHYSICIANS' PRESCRIPTIONS.** By S. F. LEACH.

"This little work will be found extremely useful to students who have received but an imperfect classical education."—THE LANCET.  
Hughes and Butler, Medical Booksellers and Publishers, 15, St. Martin's-le-Grand.

MEDICAL TEXT-BOOKS.

**Erichsen's Science and Art of SURGERY;** being a Treatise on Surgical Injuries, Diseases, and Operations. One vol. 8vo, illustrated by upwards of 350 Engravings on Wood. 42s. cloth.

**QUAIN ON DISEASES OF THE RECTUM.** Post 8vo, illustrated by Lithographic Plates, 7s. 6d., cloth.

**QUAIN'S ANATOMY.** Edited by Dr. SHARPEY and Mr. QUAIN. Fifth Edition. Two vols. 8vo, 400 Engravings on Wood, Eds. 42s. cloth.

**ELLIS'S DEMONSTRATIONS OF ANATOMY.** A Guide to the Knowledge of the Human Body by Dissection. Third Edition. Small 8vo, 12s. 6d., cloth.

**KIRKE'S and PAGET'S HANDBOOK OF PHYSIOLOGY.** Second Edition. One vol., with Illustrations on Steel and Wood, 12s. 6d., cloth.

**DR. MURPHY'S LECTURES ON THE PRINCIPLES AND PRACTICE OF MIDWIFERY.** Complete in one vol. 8vo, with many Illustrations, 16s.

**DR. BALLARD ON THE PHYSICAL DIAGNOSIS OF DISEASES OF THE ABDOMEN.** Large 12mo, 7s. 6d., cloth.

**DR. WALSH ON DISEASES OF THE LUNGS AND HEART;** their Symptoms and Treatment, including the Principles of Diagnosis. Second Edition, greatly enlarged. One vol., 12s. 6d.

**DR. WALSH ON THE NATURE AND TREATMENT OF CANCER.** 8vo, with Illustrations, 6s. 6d.

**DR. HASSALL'S MICROSCOPIC ANATOMY OF THE HUMAN BODY IN HEALTH AND DISEASE.** Two vols. 8vo, with numerous Coloured Plates, 42s. 6d.

**MORTON'S SURGICAL ANATOMY OF THE PRINCIPAL REGIONS.** Completed by Mr. CADGE, late Assistant-surgeon, University College Hospital. Twenty-five Lithographic Illustrations, Coloured, and Twenty-five Woodcuts. Royal 8vo, 41s., cloth.

Printed for WATSON and MABERLY, Booksellers and Publishers to University College, 28, Upper Gower-street, and 27, Ivy-lane, Paternoster-row.

Just published, 8vo, price One Shilling,

**Painless Tooth-Extraction, without CHLOROFORM;** with Observations on Local Anæsthesia by Congestion in General Surgery. By WALTER BLUNDELL, Surgeon-Dentist. London: John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 8s. 6d.

**Change of Climate as a Remedy in VARIOUS CHRONIC DISEASES.** By D. J. T. FRANCIS, M.D. "Proceeds from the pen of a well-informed practitioner and an accomplished gentleman, well acquainted with the subject upon which he treats."—THE LANCET.

"A very meritorious production."—MEDICAL TIMES AND GAZETTE. London: John Churchill, New Burlington-street.

Just Published, price 3s. 6d.

**The Journal of Psychological Medicine and Mental Pathology,** No. XXVIII. Edited by FORBES WINSLOW, M.D., D.C.L., late President of the Medical Society of London.

CONTENTS:—

1. Psychological Inquiries.
2. Artistic Anatomy.
3. The Correlation of Psychology and Physiology.
4. Symptomatology of Insanity.
5. On the Classification of Mental Diseases.
6. On Non-Mechanical Restraint in the Treatment of the Insane.
7. Recent Trials in Lunacy.

ORIGINAL COMMUNICATIONS.

On the Causes and Morbid Anatomy of Mental Diseases.  
On the Connexion between Morbid, Physical, and Religious Phenomena.  
London: J. Churchill, New Burlington-street.

On the 1st of October, 1864, price One Shilling, No. 159, of

**The Pharmaceutical Journal,**  
Containing the  
TRANSACTIONS OF THE PHARMACEUTICAL SOCIETY.

CONTENTS:—The School of Pharmacy: a few Words of Advice to Students—The Medicine Stamp and Licence Acts: Recapitulation—The Cholera, the Medical Profession, and the Board of Health: Instructions of the Board of Health against Cholera—Late Hours of Business—Liverpool Chemists' Association: Meeting—Phytological Club—Katempe, or the Miraculous Fruit of Soudan (with Cuts)—New Species of Phrynum—The Coca Tree of Peru—Preparations from Cannabis Sativa in India—The Cinchona Barks—Materials for Paper-making, procurable from India—On the Uses of Turf in Ireland: Peat Charcoal—Binoxide of Lead—Adulteration of Sulphate of Quinine with Sulphate of Soda—Antimony Shot—The Metamorphosis of Sugar in Animal Nutrition (continued)—Tannin and Gallic Acid—American Pharmacy—Correspondence on the Early Closing Movement, &c.

VOLUME XIII. may be had in boards, as well as the preceding volumes, price 12s. 6d. each.

London: John Churchill, New Burlington-street; Macalishan and Stewart, Edinburgh; and Fannin and Co., Dublin.

Now ready, in Three Vols., post 8vo,  
**A. Physician's Tale.**  
By HERBERT MILNER.  
Hurst and Blackett, Publishers, Successors to Henry Colburn, 13, Great Marlborough-street. Orders received by all Booksellers.

Now ready, in fcap. 8vo, with Woodcuts, price 7s.  
**Lectures on Polarized Light,** together with a LECTURE on the MICROSCOPE, delivered before the Pharmaceutical Society of Great Britain, and at the Medical School of the London Hospital. By the late JONATHAN PERRIER, M.D., F.R.S., &c. Second Edition, greatly enlarged from Materials left by the Author. Edited by the Rev. BADEN POWELL, M.A., V.P.R.S.  
London: Longman, Brown, Green, and Longmans.

**DISEASES OF THE KIDNEY.**  
Lately published, in 8vo, price 5s.  
**On the Nature and Treatment of DISEASES of the KIDNEY** connected with Albuminous Urine (Nephritis Brightii). By GEORGE OWEN REES, M.D., F.R.S.; one of the Examiners in the University of London; Assistant Physician to and Lecturer on Materia Medica at Guy's Hospital; Author of "The Analysis and Treatment of Urinary Diseases."  
London: Longman, Brown, Green, and Longmans.

Just published, price 5s., illustrated with numerous Engravings on Wood.  
**The Eye in Health and Disease.**  
With a description of the Optometer, for the adaptation of Spectacles, for Impaired, Defective, or Aged Sight. Being the substance of Lectures delivered at the Central London Ophthalmic Hospital. By ALFRED SMEE, F.R.S., Surgeon to the Bank of England, Surgeon to the Central London Ophthalmic Hospital, &c. Second Edition; to which is added a Paper on the Stenoscope and Binocular Perspective.  
Longman and Co., Paternoster-row; Horne, Thornthwaite, and Wood, 123, Newgate-street.

**Second-hand Medical Books.—H. K.**  
LEWIS'S Catalogue for October is now ready, and will be forwarded to any address. Also, Catalogue of Public Medical Library of Modern Works. Books bought or exchanged. New Books supplied at a Discount of Twenty per Cent.  
H. K. Lewis, 15, Gower-street North.

**"The Times."—The "Evening Mail,"**  
being half the price of "The Times," is published in London three times a week, on the afternoons of Monday, Wednesday, and Friday; in time for the country post. The "Evening Mail" contains all the matter of "The Times," (except the Advertisements), and includes the Second Edition of "The Times," and the Corn and Cattle Markets, &c., on the day of Publication. Subscription 32s. 6d. per half year in advance. This paper, and all the London newspapers, supplied by W. DAWSON and SONS, Abchurch-yard, and 74, Cannon-street, City, London. Established 1800.

**Mayall's Daguerreotype Portrait**  
GALLERIES, 224, Regent-street, (corner of Argyle-place,) and 433, West Strand.  
Mr. Mayall begs to invite inspection of his extensive collection of DAGUERRETYPE PORTRAITS OF EMINENT MEDICAL, SCIENTIFIC, and LITERARY MEN, Panoramas from Nature, and Views of the late Exhibition; together with specimens of every improvement in the art. The originals of THE LANCET PORTRAITS on view.

**If you require Family**  
ARMS, send Name and County to the HERALDIC OFFICE. Fee for Search and Sketch, 3s. 6d., or postage-stamps; Crest Engraved on Seals, Signet Rings, &c., 8s. 6d.; Arms, with Name, on plate, for books, £1 1s.; Arms Painted, Empanelled, and Quartered.  
TESTIMONIALS, Memorials, Addresses, and Votes of Thanks written, Illuminated, and Emblazoned on Vellum.  
H. SALT, Lincoln's-inn Heraldic Office, Great Turnstile, Lincoln's-inn-fields.

**H. Silverlock's Medical Label Ware-**  
house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-lane, Doctors'-common, London.  
The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.  
Catalogues of each sort of Labels are published separately, and will be sent per post on application.

**Allen's Illustrated Catalogue,** containing size, price, and description of upwards of 100 articles, consisting of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes, Writing-desks, Dressing-cases, and other travelling requisites, forwarded on receipt of two stamps.  
ALLEN'S TRAVELLING-BAG (patented) has the opening as large as the bag itself, and therefore possesses an immense advantage over all others.  
ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK, and their New Quadruple Portmanteau (containing four compartments), are the best articles of the kind ever produced.  
J. W. and T. ALLEN, Manufacturers of Portable Barrack-room Furniture, and Military Outfitters, (see separate Catalogue,) 18 & 22, WEST STRAND.

# THE BRITISH MEDICAL DIRECTORY FOR 1855.

The Editors respectfully and gratefully acknowledge the receipt of a large number of "Returns" for this Directory.

The Editors have stated on previous occasions, that when the entries in the Directory for the current year (1854) are found to be correct, a mere intimation of that fact will be sufficient; but when alterations are required, they should be distinctly specified, and in all cases the Names should be written clearly, and at full length.

Lists of the Names of duly-qualified Practitioners resident in the several Cities, Towns, and Villages of the United Kingdom, will be thankfully received, as also information of the Death, Removal, or Appointment to a Public Office, of any duly-qualified Practitioner. In the Metropolis, and other Cities and large Towns, the streets and numbers of the Houses should be given.

Duly-qualified Practitioners who have already responded to these appeals would confer a favour on the Editors by inducing Professional friends and neighbours to make their "Returns" as quickly as possible, as delays might evidently cause some names to be omitted.

"The BRITISH MEDICAL DIRECTORY, for ENGLAND, WALES and SCOTLAND," to be published on the 1st of January, 1855, may be obtained of all Booksellers and Newsmen, price Six Shillings, (including One Shilling postage.)

OFFICE, 423, STRAND.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

## Important Saving, by Pre-payment,

in the PURCHASE of

NEW WHITE MOULDED VIALS.

APSPLEY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

1 oz., 1 oz., & 1 1/2 oz. per Gross, 8s.	
2 oz. " 7s.	
3 oz. " 6s.	
4 oz. " 10s.	
6 oz. " 12s.	
8 oz. " 12s.	
4 1/2 oz. graduated in 8 doses 12s. 6d.	

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSPLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

## Huxley's Fulcrum

ABDOMINAL BELT will be found, from its mechanical arrangement, (acting diagonally,) and producing the required support for the lower part of the Abdomen, to be the most complete and comfortable arrangement ever invented. It is extremely light, weighing only 4oz. Price 18s.

Measures required.—Circumference at A, B, and C; depth from A to C.

A discount of 20 per cent. to the profession.

HUXLEY and CO., 8, Old Cavendish-street, late of 5, Vere-street, Oxford-street.

## Ladies' Belts.—Bailey's

ELASTIC LADIES' BELTS are found to be some of the most useful articles in his establishment. They are worn by those who are delicate in constitution, as they support the Back and Abdominal Muscles, giving the greatest possible comfort before and after Accommodation. They are without Buckles or any incumbrances, and easily adjusted. Prices, 15s., 35s., and 45s.

Those without Elastic are much used by Surgeons for persons immediately after Accommodation, and called Bailey's Compressing Belts. Price 10s. 6d., 15s., and 25s.

Hospitals and Lying-in Institutions supplied. Females in attendance, and private rooms for trying on.

Address, WM. HUNTLY BAILEY, 41A, Oxford-street, London.

## A New Discovery.—Mr. Howard,

Surgeon-Dentist, 53, Fleet-street, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without springs, wires, or ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will never CHANGE COLOUR OR DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed teeth rendered sound and useful in mastication.

53, Fleet-street. At home from Ten till Five.

## Teeth.—Mr. Alfred Jones, of Gros-

venor-street, has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

TO THE SURGICAL AND MEDICAL PROFESSION.

## W. F. Durroch, late Smith, begs to

inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas-street, (near the Hospital,) in Southwark.

Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.

SPECULUM ANI, made by W. Durroch, for John Elliot, Esq., may be had at a moderate price.

## Scientific Professional Apparatus,

manufactured and sold by HORNE, THORNTON, and WOOD, 121 and 123, Newgate-street, London, who invite attention to the following articles, which have given universal satisfaction:—

MEDICAL ACHEOMATIC MICROSCOPES, in Case, for Anatomical Urinary Deposits, &c., £2 10s., 25 5s., and upwards.

ELECTRO-GALVANIC MACHINES, giving a uniform current of galvanism of great quantity, and of the only form and construction suitable for Medical Application, in portable Case, £3 3s., 45 6s., and 48 8s.

URINOMETERS, gilt metal, 14s.; glass, 6s. 6d. In Case, for pocket, with Thermometer, Acid, &c., 31s. and 35s.

APPARATUS and TESTS for ANALYSES of URINE and TOXICOLOGY In Cases, 45 6s., 48 6s., and £10 10s.

\* Any required information and price-lists forwarded on application.

## New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES—440, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.

CAPITAL, £100,000.

TRUSTEES.

SIR JAMES DUKE, Bart., Ald., M.P.

WILLIAM FERGUSSON, Esq., F.R.S.

SIR CHARLES HASTINGS, M.D., D.C.L.

GEORGE JAMES GUTHRIE, Esq., F.R.S.

DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.

GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

### MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DULY-QUALIFIED MEDICAL PRACTITIONERS AS THE MEDICAL ADVISERS OF THE COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.

MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. ON ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES EFFECTED THROUGH THEIR INTERMEDIATION.

### EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and Influential AGENTS wanted.

## Engineers' Masonic and Universal

MUTUAL LIFE ASSURANCE SOCIETY, 345, Strand, London.

During the prevalence of Cholera, Policies for three months (renewable, if required, at the expiration of that period) are granted by this Society, covering the risk, not only of Cholera, but of all other diseases. Rates may be obtained at the Office.

Annuitants admitted to a share in the Profits.

No charge for Policy Stamps.

Credit given for half the Premium.

Assignments and Transfers of Policies registered free of charge.

A liberal commission allowed to Solicitors and Agents on the introduction of business.

ANTHONY PECK, M.A., Actuary and Secretary.

## Poultices superseded by the use of

MARKWICK'S PATENT SPONGIO PILINE.

As a substitute for common poultices and fomentations, the superiority of this article is unquestionable. It is strongly recommended by the most eminent of the Faculty for its cleanliness, economy, lightness, and general efficacy, and is now used in several of the hospitals. Also Markwick's Patent Piline, for Cholera Belts, Rheumatism, Chest Protectors, Respirators, Lumbago, &c.

Sold, retail, by Chemists and Druggists, and wholesale only by

GEORGE TRIMBEY, 41, Queen-street, Chesham.

## M. Pillischer's Newly-Constructed

STUDENT'S MICROSCOPE, which, for solidity, portability, and reasonable price, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7in. by 6in., £5 10s.; or with M. Pillischer's own-made, 11in. of 18 degs. angular aperture, and 1in. of 60 degs., £7.

The above stand with lever stage, extra eye-piece, double mirrors, animalcule cage, &c., £9; or with Pillischer's glasses, £9 10s.

A list of prices will be sent free on application to M. Pillischer, 88, New Bond-street.

CITY OF LONDON PIANOFORTE MANUFACTORY.

## New Pianofortes for Hire,

with the option of Purchase or Exchange, packed free.

G. PEACHEY (Maker to the Queen), 73, Bishopsgate-street Within, opposite the Marine Society.

ROYAL VICTORIA PICCOLO PIANOFORTE, AS EXHIBITED AT THE GREAT EXHIBITION.

The most extensive and elegant assortment of Pianofortes in London New and Second-hand, of every description and price, for SALE, HIRE, EXCHANGE, or EXPORTATION, at the lowest prices for Instruments that really can be warranted.

G. PEACHEY, MANUFACTORY and WAREHOUSE, 73, BISHOPSGATE-STREET WITHIN, LONDON.

TOUCH UPON  
IMPROVED  
PRINCIPLES.

## DR. DE JONGH'S

## LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,

AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

*The most effectual Remedy for Consumption, Bronchitis, Asthma, Gout, Chronic Rheumatism, and all Scrofulous Diseases.*

Approved of and recommended by BERZELIUS, LIEBIG, WOHLER, JONATHAN PEREIRA, FOUILIER, and numerous other distinguished scientific chemists.

Prescribed by the most eminent physicians, and supplied to the leading Hospitals of Europe.

Specially rewarded with Medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—effecting a cure or alleviating symptoms much more rapidly.

Contains iodine, phosphate of lime, volatile acid, and the elements of the bile—in short, all its most active and essential principles—in larger quantities than the pale oils made in England and Newfoundland, deprived mainly of these by their mode of preparation.

*The following Extracts are selected from some of the leading Medical and Scientific Testimonials in favour of Dr. de Jongh's Cod-liver Oil.*

### BARON LIEBIG,

Professor of Chemistry at the University of Giessen, &c. &c.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use."

The late

### DR. JONATHAN PEREIRA,

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this Medicine as yourself, whom I regard as the highest authority on the subject. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

### "THE LANCET,"

(July 29th, 1854.)

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. IN THE PREFERENCE OF THE LIGHT-BROWN OVER THE PALE OIL WE FULLY CONCUR."

"WE HAVE CAREFULLY TESTED A SPECIMEN OF THE LIGHT-BROWN COD-LIVER OIL, PREPARED FOR MEDICAL USE UNDER THE DIRECTION OF DR. DE JONGH, AND OBTAINED FROM THE WHOLESALE AGENTS, MESSRS. ANSAR, HARFORD, AND CO., 77, STRAND. WE FIND IT TO BE GENUINE, AND RICH IN IODINE AND THE ELEMENTS OF BILE."

### "THE MEDICAL TIMES,"

(August 6th, 1854.)

"We believe that the profession are much indebted to Dr. de Jongh for his laborious researches into the composition and properties of this Oil; and we have the high authority of Baron Liebig and the late Dr. Pereira, in testimony of the value of these labours. In his zeal for investigating the properties of the Oil, Dr. de Jongh made a journey to Norway, and carefully examined its varieties, its mode of preparation, and its adulterations."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S stamp and signature, by

## ANSAR, HARFORD, AND CO.,

77, STRAND, LONDON,

Sole Consignees and Agents for the United Kingdom and British Possessions, and may be obtained from respectable Chemists and Druggists in Town and Country, at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... 4s. 9d. | QUARTS ... 9s.

### IMPERIAL MEASURE.

\* \* Hospitals and other Charitable Institutions requiring large quantities may be supplied on considerably reduced terms.

# Lectures ON DISEASES OF THE JOINTS.

*Delivered at St. Mary's Hospital.*

By WILLIAM COULSON, Esq.

SURGEON TO THE HOSPITAL.

## LECTURE VIII.

### ON SUPPURATION OF THE JOINTS FROM INFECTION OF THE BLOOD.

GENTLEMEN,—In the present lecture I propose describing to you a very interesting affection of the joints which most surgeons engaged in extensive practice occasionally meet with. In large general hospitals the affection is often observed to follow amputation of the limbs or other capital operations. In lying-in hospitals it often presents itself as a complication of puerperal fever, or attacks puerperal females who do not actually labour under this fever; and, every now and then, in private practice, we observe cases of the kind following operations on the genito-urinary organs, or developed under other circumstances which shall be presently noticed. Under all these forms the disease is, I believe, one and the same, or to speak more correctly, it makes part of one and the same constitutional affection; yet, in the great majority of surgical works it is broken up into as many diseases as it has exciting causes, or has been totally misunderstood and described under the head of rheumatism. This involved the nature of the disease for a long time in obscurity, and prevented medical men from endeavouring to trace to a single cause the various local accidents which accompany the articular affection, or to explain the severe constitutional disturbance which accompanies it, and its fatal tendency, which is out of all proportion to the severity of the local disease. But it may be well to relate a few illustrative cases before I enter on an examination of the principal points connected with this interesting subject. I have no pretension to follow it out completely, this would require many lectures; but I shall endeavour at least to point out the proper method of investigating it, and of understanding the varied phenomena developed during the course of the disease, confining myself chiefly to cases connected with operations on the genito-urinary organs, and with the puerperal state.

In a former lecture I showed you how an inflammatory condition of the joints, which has been mistaken for and confounded with rheumatism, sometimes accompanies gonorrhoea. I should have added, indeed, that it occasionally attends stricture likewise. The following case is an example:—While I was attached to the General Dispensary, a man was admitted labouring under what was supposed to be chronic rheumatism. He was treated by the physician for some time, but then handed over to me in consequence of some impediment to the function of the urinary organs. On inquiry, I found that about nine months previously he had some symptoms of stricture, with the slight urethral discharges often observed in such cases. In eight or nine days afterwards he was seized with pains in the limbs, &c., which were regarded as rheumatism. When I saw him, both ankle-joints were much swollen and painful, he had difficulty in passing urine, the orifice of the urethra was contracted, and there was a stricture just anterior to the membranous portion of the canal, with slight discharge. Bougies were immediately employed, the strictures were removed by gradual dilatation, and with them disappeared all trace of inflammation about the joints. Although this was not a case of purulent affection of the joints, I mention it here to illustrate the connexion between articular disease and affections of the genito-urinary system. The inflammation was probably confined to the synovial membrane, and it was evidently of the same kind as that improperly denominated gonorrhoeal rheumatism. Many cases of a similar kind have been recorded by other surgeons. I have published an analysis of several in THE LANCET for June 12th, 1852. The passage of a bougie for the cure of stricture was the exciting cause of the articular disease. In several of the cases the inflammation and secretion of pus were peri-articular, or confined to the inter-muscular cellular tissue, and the patients ultimately recovered; but, in many other cases, the joints themselves were affected, various internal organs became implicated, and the result was fatal. M. Velpeau relates an interesting case of this kind:—A young man had been treated by him for stricture and greatly relieved. His urine passed freely, and he had learned to introduce the

No. 1622.

bougie himself, which was done occasionally, whenever the least difficulty in passing urine was experienced. Some years passed over in this way, but the stricture reappeared, in consequence of his neglecting the use of the bougie. He placed himself again under the care of M. Velpeau, a bougie was introduced without any difficulty, and the case was progressing favourably. The bougie was passed one evening, and on the next morning he was found labouring under severe febrile symptoms. The attack was preceded by long and violent rigors, and ended in copious perspiration. It soon recurred, and the fever became continuous. The patient was bled several times, and an active antiphlogistic treatment was employed. The fever, however, remained unabated, the right knee began to swell, was extremely painful, and there were evident symptoms of purulent inflammation of the joint. The tongue now became dry, delirium set in, the patient fell into a typhoid state, and died on the sixth day. On examining the body after death a slight excoriation was found in the fossa navicularis, and several old false passages near the stricture. The urinary organs were healthy, but the prostatic plexus of veins was evidently inflamed, as were also the veins surrounding the vesiculae seminales. The knee-joint was inflamed, and contained a great quantity of pus.

If purulent inflammation of the joints sometimes takes place after the simple process of introducing a bougie into the bladder, we can readily conceive how it may follow more severe operations on the genito-urinary organs. A remarkable and interesting example of this connexion between the operations just mentioned and articular disease presented itself in 1852, in this hospital. The operation performed was lithotomy, and the calculus was crushed without any difficulty. The patient appeared to be going on favourably for four days, when he was suddenly attacked by fever; the tongue was very brown and dry; there was great thirst, and the patient complained of pain in the left knee-joint, which was considerably swollen. Every means was employed to relieve the constitutional symptoms, but he soon began to sink, and died in a low state on the seventh day after the attack. On examining the body, several deposits of pus were found on the pericardium; there was a cyst filled with pus in the bladder, and the prostatic veins were inflamed. The synovial membrane of the left knee-joint was highly injected; the cartilage covering the external condyle of the femur was softened and ulcerated through its whole thickness, down to the bone; the corresponding surface of the patella was also superficially ulcerated. The cavity of the joint contained some thin, dark-coloured pus. There was also pus in the right knee-joint; the synovial membrane was highly injected, and the cartilages were eroded. In the hip-joints were found traces of incipient inflammation, which would doubtless have gone on to suppuration had the patient survived a day or two longer. The head of the right femur was marked by a fine red injection, and the synovial membrane investing the neck of the left femur was also very vascular.

I might relate other cases of this class, from my own practice, and from the writings of other surgeons, but my present object is to fix your attention, more particularly, on the affections of the joints which accompany the constitutional disorder. It has been long observed that puerperal females are occasionally attacked by a very severe form of articular disease, which rapidly terminates in suppuration, and almost always in death. Wiseman is one of the earliest writers by whom a case of this kind was recorded. Dr. Denman was also well aware of the existence of this affection, but he seems to have had no correct idea of its nature; for he describes it as "an erysipelatous tumour, of a dark red colour, on the knuckles, wrists, elbows, knees, or ankles." The older accoucheurs thought that it depended upon suppression of the milk or lochial discharge. At a later period, it was confounded with rheumatic affections, and even at the present day it is described in many works under the name of "puerperal rheumatism." Mr. Arnott was the first, I believe, who pointed out the true nature of the affection, and since then the researches of M. Dance, of Dr. Lee, Dr. Ferguson, Dr. Copland, Mr. Henry Lee, and others, have contributed much to its elucidation.

The following cases illustrate the course and symptoms by which this disease of the joints is attended. I have abridged them from the account which I published some years ago in my work "On the Hip-Joint:"—

Mary S—, thirty-two years of age, was delivered, on the 12th of September, 1839, of her sixth child. On the third day after delivery she was seized with rigors, and complained of pain on pressure just above the pubes. On the fifth day (17th) she complained of pain in the centre of the right leg; the right knee was also painful on pressure, and the skin over it was

3

here and there of a light-red colour. The pulse was very quick and rather small, but no severe constitutional symptoms existed. The superficial inflammation of the knee seemed to disappear, and the left eye became inflamed. On the 20th, the right elbow-joint became slightly swollen and painful. Alarming constitutional symptoms now set in. There was severe headache, with some delirium; cough and hurried respiration; pulse 140; tongue red and dry; nausea; tenderness and slight tumefaction of the abdomen; skin hot and occasionally moist. On the 21st the symptoms continued unchanged; there was some pus between the layers of the cornea. On the 22nd she fell into a comatose state, and died on the following day. The body was examined eleven hours after death. There was an effusion of sero-purulent fluid into the cellular tissue of the right leg. The right knee-joint contained from three to four ounces of greenish pus, but the membranes, cartilages, and bones were not diseased. There was also a tablespoonful of thick pus in the right elbow-joint, without any lesion of its tissues. Nearly the entire cellular tissue of the left fore-arm was infiltrated with serum. The whole of the interior of the eye was disorganized by inflammation, and there was pus between the layers of the cornea. In the head, the arachnoid was found opaque, but the brain was healthy. The spermatic veins contained pus, and were inflamed; the veins behind the neck of the uterus also contained pus; the uterus itself appeared to be healthy, but there was some dark congestion of the membrane lining its neck. These were the only lesions noted in the abdomen.

The next case I shall mention is that of Mary L.—This woman was delivered on the 6th of October, 1839. She had a good deal of flooding for ten days. On the 23rd of November she first complained of some pain in the right ham; this was soon followed by the formation of a small abscess a little below the right knee, and by a larger one on the back of the thigh; these were opened, discharged pus for a few days, and healed in about a week. The general symptoms during this period were obscure. The woman was pale and weak, and her pulse was very quick, 130; these symptoms continued to the 6th of December, when she was seized with rigors, and complained of pain in the right knee-joint, with stiffness in the right shoulder. The knee was now swollen, and extremely painful; the shoulder also painful, but not swollen. Her face had a slight yellow tinge; the breathing was very quick; pulse 140; there was a slight hacking cough; the abdomen was tumid, but not painful. On the 7th the knee was still more swollen and painful; the shoulder less so; the general symptoms were aggravated. On the 8th the knee-joint was rather more swollen, and there was some pain along the course of the femoral vessels; the tongue and mouth were becoming dry and covered with sordes. On the 9th the patient had another attack of shivering; her cough became more troublesome; she began to sink, and died on the following day. The body was examined eight hours after death. The right knee-joint contained three ounces of viscid pus; the lower edge of the synovial membrane was vascular, and the cartilage of the patella was absorbed in a spot about the size of a sixpence. The shoulder-joint was healthy, but there was some effusion of serum into the cellular tissue surrounding it. In the chest an effusion of serum, to the extent of two or three ounces, was found in both pleural cavities, but the serous membrane was not inflamed on the right side. Here, however, a quantity of frothy mucus-purulent fluid issued from every part of the lung when divided. There were some recent adhesions of the left lung to the pleura, but the substance of the organ did not contain any pus. The abdominal viscera were healthy. The body of the uterus was also healthy; on dividing its walls, just above the neck, there was a copious exudation of pus, but the particular tissue in which the pus was contained could not be made out. The cavity of the uterus contained a fetid sero-sanguineous fluid. The veins of the abdomen and pelvis were minutely examined. Nothing was found until arriving at the point of bifurcation of the left common iliac; here a considerable quantity of pus was detected, and on opening the left external iliac its lining membrane was found coated with coagulable lymph. The blood of the vena cava, near its entrance into the heart, was examined with the microscope by Mr. Gulliver and the late Mr. Dahyrmple, who discovered true pus-globules in it.

In some extremely rare cases, the disease called glanders, when communicated from the horse to man, is attended with a purulent inflammation of the joints somewhat analogous to those now under consideration, and which should, I believe, be placed in the same class with them. The following example is related by M. Bonnet:—A young veterinary surgeon, while opening an abscess in the neck of a glandered horse, wounded one of his fingers. Soon afterwards the wound inflamed, and

on the tenth day a series of small abscesses extended up the fore-arm and arm. The actual cautery was applied to them, but unfortunately it was too late; the virus had reached the system. Some days afterwards an abscess appeared on the back of the thigh, and still later the ankle-joint began to swell and was painful. The patient was of strong constitution, and struggled hard against the disease for three months, but at the expiration of this time both knee-joints and the elbow-joint became involved in the complaint. He was now seized with delirium, and sunk rapidly. On examining the body, a quantity of pus was found in the joints which had been painful, but the synovial membrane did not present any traces of inflammation.

Here, gentlemen, are cases of acute inflammation of the joints terminating in the formation of pus, and proving more or less rapidly fatal. If we are to regard them, as the elder surgeons were accustomed to do, as mere local affections, it is impossible to understand the general symptoms which accompany the disease, its course, or its rapidly fatal result; for these are quite different from what is observed in the most violent cases of articular inflammation developed under ordinary circumstances. Everything, on the contrary, in the history of the disease points to a special origin; its main features are always the same, and although many cases may be attended by symptoms which would seem to indicate a variety of origin, and justify a distinction into several forms, yet these symptoms will be found to depend on accidental circumstances, and not to vary more in individual cases than we find occurring in examples of other diseases, which depend, as this one does, on contamination of the blood. The origin, the course, the symptoms, and the morbid anatomy of articular disease produced by infection of the blood are, as I have said, of a peculiar kind, different in many essential particulars from what we observe in any other form of disease of the joints. The joints which were affected during life almost always contain more or less pus, and on comparing this occurrence with the history of the disease, we find that it bears no evident relation to the intensity of the local complaint, or to its duration. In many cases, purulent effusion takes place within a few hours after the first appearance of the local symptoms, and in many other cases with so little pain or tumefaction of the joint as hardly to attract attention during life. The synovial membrane, however, generally presents traces of recent inflammation, though not of a severe degree; it is more or less injected, yet the false membranes of ordinary synovial inflammation are never found, one of the characters of the species which I now describe being the production of pus in a rapid manner, with little or no inflammatory congestion of the tissues. In some cases the synovial membrane has been found quite free from all trace of vascularity or other lesion. This has been regarded as a proof of the non-inflammatory nature of the disease, but it seems to me more rational to conclude that the injection of the vessels had disappeared after the secretion of pus, and we know that purulent inflammation under certain circumstances is of a very evanescent character. In one of the cases which I have related to you, the synovial membrane round the head of the thigh-bone was evidently injected before any effusion of pus had taken place, and it is easy to understand that this injection might have disappeared in a day or two, if the extremities of the capillary vessels had become modified by the changes which ensue on suppuration. The cartilages, ligaments, and other tissues composing the joint are usually in a healthy state, for the disease is, I believe, essentially a purulent inflammation of the synovial membrane. Still, in many cases the cartilaginous coverings of the bones are found to have been more or less eroded or absorbed, and in a very few examples the ulceration has involved the substance of the bone itself. The patient, however, is generally cut off before the disease proceeds so far. The peri-articular tissues are often the seat of sero-purulent infiltration, or of circumscribed abscesses, which are also found in the muscles of the limb, and sometimes with very extensive disorganization of the parts.

(To be continued.)

AGE AND SICKNESS.—On an attentive examination of the amount of sickness per annum falling to the lot of each person, it will be seen that there is scarcely any perceptible increase in the quantum of the sickness from the age of fifteen to that of forty, which is a period of twenty-five years; and that the subsequent increase in the ensuing twenty-five years from forty to sixty-five, although material, is by no means formidable. On the other hand, after sixty-five years of age the greatly augmenting sickness shows that the constitution of most men begins to be unequal to the continuance of physical toil.—*Report on Friendly Societies.*

## TWO

## FATAL CASES OF RUPTURE OF THE UTERUS.

By CHARLES VAUDIN, Esq., M.R.C.S., Jersey.

On Wednesday, the 10th of May, 1864, about noon, I was summoned to a poor Irishwoman, who had, I was told, been in labour since Tuesday morning. I found her sitting on the edge of her bed, supported by several women, as she felt unable to lie in the recumbent posture.

Her voice was husky and choleric; she was then suffering apparently uterine pains, and crying out loudly enough on the accession of each; they seemed to occur every quarter of an hour, but lasted only a few minutes. She was in labour of her ninth child; all except one were either still-born or died soon after birth, and presented unnaturally. I attended her about a year ago of a breech presentation, which was already so far advanced that the child was born soon after my arrival, and was dead. I remember the pelvis was a roomy one. Her age was about thirty-two; she had always been very healthy, and had never received any fall or injury, or met with any accident. Her face was anxious and dusky; the general surface bedewed with a cold, clammy moisture; her hands and feet cold and bluish; her pulse small and quick, 120, easily compressed. She had passed urine a short time since, and her bowels were freely opened the day before. She was taken in labour on Tuesday, about nine A.M., and I was told the liquor amnii had escaped about two hours after. She complained of great thirst, and would drink cold water, tea, &c., abundantly, which she vomited soon after, mixed with decided coffee-ground-coloured matter, which was undoubtedly decomposed blood. On a vaginal examination the external parts were found cool and moist, the vagina was well lubricated, the os uteri dilated to the extent of a crown-piece, the lips soft, thick, and cushiony. The presentation, which was very high up, apparently just below the pelvic brim, consisted of some softish substance easily penetrated by the finger; it was hardly placenta by its feel, yet as there had been some considerable hemorrhage, estimated at three pints, and this discharge had come on about four hours after labour, and had gradually continued up to this period, I thought it might be a placental presentation, the structure of which may have become so altered by disease or otherwise, that I did not feel justified in pushing my finger through it. A gush of blood followed the withdrawal of my hand, thereby in a measure confirming my belief. The position of the child I therefore did not feel justified in ascertaining, for I meant, had it been unnatural, to turn and deliver at the same time. The reasons why I deferred this appear further on. On carefully examining the abdomen, it was found to appear very conical; about three inches above the pubes some hard globular body was felt, but I could not satisfactorily trace anything more, as there was already much abdominal distension, and manipulation was productive of exquisite pain to the woman. On a deeper plane, more towards the spine, I felt the uterus contracted to the size of three months' gravidity.

The woman's condition, from the moment of my visit, was that of general and rapidly-increasing collapse, so that no operative measures could have been justifiable. The vomiting was urgent, and could not be allayed by sinapisms, Prussic acid, ammonia, brandy, ether, &c., nor had any of these the effect of rousing her sinking powers. Heat was applied all over her body; but soon the collapse became more pronounced, the vomiting incessant, the ejected matters consisting of decomposed blood. About four she became jactitating and hippocratic, yet free from pain, and before six she was dead.

Two hours after—viz., eight P.M.—I proceeded to open her, at the request of the relatives. I could now accurately enough trace the form and members of the child through the abdominal parietes. Its head, feet, and hands were together in the left half of the abdomen, the back towards the epigastric and hypochondriac regions. The uterus could also be distinguished. On cutting through the peritonæum near the ensiform cartilage, from four to six pints of dark-coloured, very offensive fluid escaped; the stomach, which was much distended, had been opened, and it contained this fluid. The child, a well-formed male of the full period, was very large; it weighed from twelve to thirteen pounds, and was found amongst the mass of intestines. The placenta had been expelled from the uterus, and had fallen into the pelvic cavity; the decidua were attached, a portion of which was encysted, and contained about two ounces of fluid. The placenta was entire, unlacerated, its uterine surface even and natural; the child was connected to it by the funis, which was twisted three turns around its neck; the face, neck, and lips above the constriction, which was very

evident, were livid and congested. It was quite warm, but all pulsation had ceased; attempts to inflate its lungs were quite useless. In the left side of the pelvis two large clots of blood were found; they must have weighed nearly a pound each, were of a very dark colour, seemed recent, and offered casts of that part of the pelvis they were in contact with. The rent in the uterus was longitudinal, and on its left side, extending nearly the whole length from within an inch of the attachment of the broad ligament down to the os, which was open up to the commencement of the vagina, thus completely exposing the cavity of the uterus. The direction of the laceration was rather obliquely forwards, from above downwards, so that the fissure at the os is rather anterior to that near the fundus. The vagina was not lacerated. The organ was empty. At the upper part of the rent the uterine walls were full two inches in thickness, whilst at the os and cervix the measurement was six-eighths of an inch. The structure was healthy and firm; the uterine sinuses were of the diameter of crowquills, many of them plugged with firm coagula, whilst others were wide and gaping. The peritoneal investment was entire, except at the seat of laceration. Its measurement at the fundus was seventeen inches and a half in circumference; at the cervix, eight inches and a half. Both ovaries were shrivelled and bloodless. The remaining pelvic organs were healthy and natural, the pelvis itself was roomy, and there existed no malformation or impediment in it whatever.

I have learnt that the woman was seen by an irregular practitioner on Tuesday, about four P.M., and that he introduced his hand into the vagina, and during his manipulations upon her she felt "a sudden and great pain," exclaimed that "something had burst, and that she was killed." He left her, and did not call again. Soon after this the vomiting commenced, and soon acquired its serious character, coldness and shivering ensued, and she was hourly getting worse, when I found her in the state above described.

To my friend Dr. Brohier I am indebted for the opportunity of recording the following facts concerning another case of rupture of the uterus, which occurred in his practice a few days ago:—

A poor woman, thirty-five years of age, strong and healthy, and of a remarkably energetic character, had attained the full term of her tenth pregnancy, and was taken in labour. She had been suffering pains for nearly twenty-four hours when Dr. Brohier was summoned. The liquor amnii had escaped about twelve hours before he saw her. The os uteri was dilated to the extent of a crown-piece. A vertex presentation was diagnosed, the face directed to the left cotyloid cavity, the occiput to the right sacro-iliac synchondrosis; the pains frequent, but trifling and ineffectual. She remained in this condition for twelve hours without any further evidences of the completion of labour. Besides these operative proceedings, the child was turned, and the feet brought down; but owing to some impediment or other, the precise nature of which could not be determined, the delivery could not be accomplished. Her condition became critical; collapse ensued, from which she could not be rallied, and which rendered any operative measures unjustifiable.

Let it carefully be remarked that there was an entire absence of the usual symptoms of rupture of the uterus.

She died twelve hours after Dr. Brohier's first visit, and about twelve hours after death he opened her in the presence of Mr. Jones and myself.

The abdomen contained a considerable quantity of dark fluid blood. The child, an enormous female of the full period, was partly in the cavity of the abdomen, in contact with the intestines. It had been extruded from the uterus, except the legs and feet, which remained within the organ. The placenta was only half detached, and yet in contact with the right side of the uterus. The rupture had taken place in the right lateral aspect of the uterus. The fissure extended close up to the os, and went almost half through its circumference; the edges were here jagged and shaggy, and the whole organ of a very dark colour, very flabby, and much softened. The pelvis was rather small, but well formed, with the exception of an unnatural prominence of the last lumbar vertebra and promontory of the sacrum, which materially diminished the diameter of the pelvis in this direction.

The child weighed eleven pounds; measured from vertex to the heel twenty-four inches; circumference of the head, fifteen inches and a half; from vertex to symphysis of jaw, nine inches and a half; around the shoulders, eighteen inches; circumference of the thorax at the ensiform cartilage, fifteen inches and a quarter; circumference of the pelvis, fourteen inches; circumference of the thigh, nine inches.

Jersey, September, 1864.

## TREATMENT OF CHOLERA WITH SUGAR.

By SAMUEL WOLFF, Esq.

THE number of *THE LANCET* for April 8th contains an article of intense interest, by Dr. J. I. Mackintosh, of Edinburgh, on the "Treatment of Cholera with Sugar;" yet the caption is such that it might not be generally read, and were it not for the name of the author would excite ridicule before perusal, if perused at all. "What nonsense next? They have tried mustard and salt, and here is somebody trying sugar for cholera!" Such was the remark that drew my attention to the article.

I am not about to write a criticism on Dr. Mackintosh's views. I neither intend to praise nor to criticise, but simply to give four cases which came under my treatment last month in a German family, and the treatment of which has much to do with that article. Dr. Mackintosh will see that he was not the only person using sugar in cholera. The result of the cases I am satisfied will be interesting to Dr. Mackintosh, whilst the manner in which I was forced to use sugar will contrast but in a very sorry manner with the doctor's scientific reasons for doing so.

On the 18th of June cholera broke out in this city with fearful violence; none that were attacked with it for the first two days recovered; the average duration of the disease was about eight hours. On the 23rd of June, I was called to a German, who had been in this country only a short time. On the morning of the 23rd he had driven a cow some distance from the country, and whilst hot drank large quantities of cold water. In the middle of the day he was seized with symptoms of cholera, which increased until I saw him, (about three o'clock P.M.,) when I found him vomiting and purging rice-water, almost pulseless, cold, and covered with a clammy sweat, slightly collapsed, but cramping fearfully. I used the customary remedies—small doses of calomel frequently repeated, and mustard plasters to the ankles, wrists, and abdomen; I gave him also small quantities of pounded ice and brandy. His wife was very desirous to give him sugar and water, as she said it was the usual drink in Germany, and he would like it better than anything else. I protested against its use, upon the score that it would be apt to make him vomit more, and could not be persuaded to let him drink any of it, although I was solicited repeatedly by his wife and sister-in-law to give it to him. The man sank gradually until he died, about six o'clock P.M. On the following morning about seven o'clock he was buried.

About ten o'clock on the morning of the burial of the deceased, I received a summons to repair to the same house as in the previous case, that the German's daughter had the cholera. I went with all speed, and found a little girl, about seven years of age, deeply collapsed, purging and vomiting rice-water every three or four minutes, cold and clammy, with very slight pulse, hands shrivelled, and eyes sunken. They had given her several draughts of sugar and water before I arrived, and, as I found all the cases terminating so unfavourably, I resolved to let them use the sugar and water, and followed my usual course of treatment. The child sank gradually until she appeared to be just dying, in which condition she lay for some half hour or so, (I being called away to the case I shall give next,) when her pulse began gradually to rise, which it continued to do, and she recovered.

As I stated just above, I was called away whilst attending the little girl to see her aunt, who had been waiting upon the child during the time she was sick, and finding there was little hope of her niece recovering, she became desponding, felt (as she says since) herself getting weaker, until she could no longer stand. She staggered and fell upon the floor; they carried her to a bed, and I was requested to go to her room. When I saw her I could detect no pulse; body cold; a clammy sweat commencing to break out; cramps very severe in the arms and legs; rice-water discharge pouring away from her, which she was not conscious of, and, with the exception of when the cramps were on her, she showed little signs of life. She would swallow anything that was put in her mouth; her sister-in-law was very attentive in giving the sugar and water. I pursued the course as usual, with the exception of putting a blister over the right side, she having had some signs of congestion a few days before. She is now well and hearty, having made an excellent recovery. As in the previous case, she sank as low as it was possible to do, and remained so for some time, when a change took place; the pulse could be perceived; she urinated freely, and reaction came up until it rose to high fever, from which she suffered for two days.

On the 25th the last woman's husband was taken ill. The

cholera ran its course in spite of all the medicine. He lay as dead for some three hours, at the expiration of which time he commenced to recover, and is now well, but his constitution is greatly shattered. In this case I ordered the sugar and water to be given freely, which was done without much persuasion.

I shall not make any remarks upon these cases, but leave them, trusting that if there are any other practitioners who have used the sugar they will make the result publicly known, as it is important all such cases should be recorded.

Independence, Missouri, United States, July, 1864.

## A Mirror

OF THE PRACTICE OF  
MEDICINE AND SURGERY  
IN THE  
HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.—Mosesævi. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

## CHARING-CROSS HOSPITAL.

HYDROPHOBIA; DEATH; AUTOPSY.

(Under the care of Dr. ROWLAND.)

(Concluded from page 214.)

*State on admission, at twelve A.M., on Monday, July 3rd.*—Expression of countenance, anxious and watchful, more like dread of something going to appear; face pale and intelligent. The patient is of spare habit; hair light-brown, fine and long; has been brought up at a Sunday-school; talks distinctly, and has full use of mental powers. Pulse natural; tongue steady and clean; bowels open yesterday morning; pupils dilated; skin hot, dry. Mr. Diamond, the house-surgeon, poured out a little of the tonic mixture kept ready; but when offered to her she refused to taste either this or water. She had at the same time spasmodic action of the muscles of the trunk and upper and lower extremities, accompanied with sobbing and sighing, as when a person unaccustomed to douching has a bucket of cold water thrown over him. Blowing on the face produced the same effects as the showing of water. When the patient was gazed at for some time the anxious look would go away, and break into a smile. The mental powers were preternaturally heightened.

A draught, composed of fifteen minims of chloroform, ten of laudanum, in an ounce of water, was now offered, but the sight of it caused the convulsions to come on again. The house-surgeon at last succeeded, by getting her to close her eyes, open her mouth, and at the same time gently expiring. He placed the fluid suddenly into the mouth with a spoon; but directly it was in the cavity the convulsions came on again more severe than before.

Half-past twelve A.M.—Dr. Rowland saw her, and ordered fifteen minims of chloroform, to be taken every third hour, and at half-past one o'clock he prescribed a small dose of calomel, to be followed by an enema of turpentine and castor oil. The back was also to be rubbed with equal parts of chloroform and tincture of aconite.

Great difficulty was experienced in giving her the calomel. It was tried mixed up with a little sugar in a teaspoon; she took it into her own hand, but when she got it close to her mouth the spasmodic convulsion came on. It was at last tried, at Dr. Chowne's suggestion, placed between bread and butter, and was thus ingested. When she had eaten it all, she asked for more, and thought she could drink a little warm water, but she could not take it when presented. It was tried through a silver tube, but without success, and the attempt to give an enema also failed. The application down the spine directly brought on convulsions, and at the first application she threw herself on all fours, like an animal.

Half-past two P.M.—Prefers sitting up, the thighs flexed, with the elbows resting on the knees, the hands being placed at each side of the head. When requested to lie down, she says she feels easier when in the position just described, and that if she attempted to recline the cold would hurt her back. To remedy this, the sheet was warmed, and with a little persuasion she gently overcame the difficulty, as she is very willing, and attempts to do anything you propose to her. Immediately on

lying down she has, however, an attack, though enjoying the full use of her senses.

Pupil dilated; tongue whitish; skin hotter, dry; pulse quick, 140.

Three P.M.—Has pain at the top of the head. Is lying down with her hands pressed at the sides and at the back part of the cranium; says she is easier so. Complains very much of a painful stiffness at the back part of the neck. Convulsions, which occurred about once every half-hour, are more frequent and severe. Expression more wild and anxious. When asked to glance at a looking-glass, she complied, and directly she caught sight of herself the fit was brought on; soon after this she passed a little pale urine.

Half-past four P.M.—Asleep; looks very wild and anxious; breathing in a sobbing manner.

Five P.M.—Her father is with her; she looks much altered; convulsions brought on by the slightest breath; is very pleased to see her mother; holds her hands, and does not want her to leave her.

Half-past five P.M.—Has eaten some bread and butter; feels very thirsty, but she says it is no use trying to drink, as it will choke her. A window open at the end of the ward causes too much atmospheric disturbance for her. Cold applied without wind does not produce much effect. She is much worse, the attacks being more frequent.

Half-past six P.M.—Fits much stronger and more frequent, being four or five in the quarter of an hour, and causing some difficulty to the nurse to keep her in bed. *She is asking if the dog has been killed yet.*

Seven P.M.—Is now in a very strong convulsion. She is given to inhale, on a piece of lint, about one drachm of chloroform, and after a little trouble and persuasion, she took the lint into her own hand and held it under her nose. This soothed her considerably, so much so, indeed, that when it had all evaporated she asked for more. Mr. Diamond kept on with this continuously till—

Eight P.M., when Dr. Rowland came again to see her. The latter tried to put her completely under the influence of the anæsthetic agent, but failed, as had happened to the house-surgeon previously. At this time it was difficult to apply the aconite to the back, for when she sat up, which was the only way to accomplish the frictions, the convulsions came on again, as severe as they had done before the chloroform was inhaled, directly an attempt at rubbing was made. She violently threw herself back, and said, "Don't do it any more—I shall be better presently." Ice was also given her by her mother, but she would not take it on any inducement, giving as a reason that her brother used frequently to give her ice after he had had it in his mouth, and she had therefore taken a dislike to it.

Nine P.M.—She complains of a severe pain, referred to the epigastrium and throat; convulsions worse during the last half-hour, occurring violently every two or three minutes. The mention of water, or the disturbance of air caused by the clothes of the attendants, bring on a paroxysm immediately.

Half-past ten P.M.—Convulsions worse; has once or twice started up in bed suddenly in the standing position, and then thrown herself again forcibly on her back.

Half-past eleven P.M.—Passed about a pint of limpid urine; is much quieter; has begun again with the inhalation of chloroform; pulse small and quick; suddenly sits up in bed, and then throws herself back; cannot bear her mother to leave her or let go her hands; complains greatly of the pain in the back of the neck and epigastrium; skin hot and moist.

Second day, one A.M.—The paroxysms during the last hour have become less frequent,—only three or four times, except when she is excited by the sound or mention of water. The chloroform was again given her on lint to inhale, but, as she had a repugnance to it, it was not pressed. The patient has evinced slight aberration, fancying herself at home. She has shown an inclination for milk and an orange; but, although she attempted several times with her own hand to take it, each time she placed it near to her mouth the violent spasm took place.

Two A.M.—Better; only one paroxysm during the hour; the impression of being at home increased; asked her mother to bring out her bedclothes; has had a few minutes' sleep.

Three A.M.—Fits much more frequent; jumped up suddenly on her feet, and voided a small quantity of very offensive fæces; constantly asking her mother trivial questions about her toys, workbox, &c.; great dread of her parent leaving her side for an instant; constantly repeating her pleasure at the dog being killed, (*which circumstance had previously been told her, though incorrect, in order to quiet her*); complains of very great pain in the epigastric region; for several minutes is

unable to complete a sentence, being interrupted by the fits; complains of great heat—wants her clothes and bedclothes taken off; distressing anxiety for fear her mother should leave her, turning every instant to see if she was still present.

Half-past three A.M.—About this time again passed a small quantity of black offensive fæces, and started up suddenly, just as previously; is inclined to be sick; pain in the epigastrium and throat increased; says she feels hot and bad; pulse small, occasionally intermits; skin moist.

Four A.M.—After a retching attack, the patient spat out a thick white viscid saliva, which hung like a drop tenaciously to the lower lip; this continues frequently, and is always preceded by retching; convulsive paroxysms more severe and frequent. The child's body performs violent writhing movements; the head is thrown back, and the extremities are in violent motion; she occasionally catches hold of the bedclothes, and fondles them tightly; has left off the sitting up in bed; when this occurred, she always threw herself back with a violent effort, she could not do so quietly.

Ten minutes past four.—Retching and convulsions more severe; saliva increased; looks at times very wild and vicious; the mother has started back two or three times, afraid of her; delirium increased; calls the house-surgeon "Henry;" says a strange dark man is coming up-stairs; wants the street-door shut. The retching for the last five minutes was continuous, and is so now, beginning with a peculiar eructating noise; has just had a kind of suffocative attack, lasting for nearly half a minute, which seems to have prostrated her much. Since then the paroxysms are weaker; delirium increased.

Twenty minutes past four.—Looks more wild; says she is mad because the dog bit her; complains of great pain in the throat; eyes sunken; expels her breath through her nostrils with a snort, but takes it in through her mouth; the inspiration is short, expiration quick and forced; has had no retching for the last five minutes till just now, and has vomited up a little matter like thin gruel. Says, "Let's cut our throats!" and is now saying the Lord's prayer.

Half-past four.—Has been for the last ten minutes continuously delirious; talks most about blood, and articles of dress being red; says "We all look red," and then "We are all white;" no retching; spits a little saliva occasionally; the peculiar eructating noise is still present; recites verses.

Half-past five.—The convulsive paroxysms, which are nearly consecutive, consist mostly in rigidity of the back, neck, and inferior extremities, which latter are sometimes kicked up and down; the arms are moving continuously across the chest; sickness has become more frequent; she is much weaker after several of the suffocative attacks; the breath smells earthy; delirium nearly continuous; talks much of fire, blood, dress, and riches; hands and feet cold and purple-coloured.

Quarter to six.—Sickness, which had stopped for about a quarter of an hour, has come on again; the matters vomited are greenish, watery, and frothy; the convulsions are more like a very exaggerated fit of shivering, excepting the rotatory motion of the arm; the back is quite stiff.

Ten minutes past six.—Pupils widely dilated; is in a profuse sweat; extremities are hot again; vomiting, which had stopped for a few minutes, has come on again, and is yellow and watery. Pulse 140. Surface of the body moist; is much more exhausted; sighing has come on nearly continuously; is talking of heaven; and connects words in rhymes.

Half-past six.—Is much worse; paroxysms weaker; delirium nearly continuous; tries to scratch; says she must catch the bystanders, but is unable to move out of the flat position she is in.

Ten minutes to seven.—Sickness and convulsions continuous; delirium more of a muttering character. Pulse very small and thick. The head is bathed in perspiration; the hands and feet cold and dark-coloured; the right cheek has a greenish look; the lips are dark; the eyes are fixed upon the persons watching her; she vomits continuously.

Quarter-past seven.—Pupils widely dilated; colder and more purple; vomiting still continues, seems to choke her, not having power to get the fluid out of her mouth; mutters more, so as not to be so easily understood.

Quarter to eight.—Sobbing constantly; convulsions are similar to severe shivering; is becoming comatose; cannot answer any questions; muttering delirium.

Quarter-past eight.—Is sinking fast; always sobbing; arms continue to move occasionally, with convulsive starts of body.

Nine.—Low muttering; delirium; foams at the mouth; pulse hardly perceptible at the wrist; slightly over cardiac region.

Half-past nine.—The sobbing continues; occasional convul-

sive starts; is quite comatose; pupils widely dilated; foams at the mouth; no pulse at wrist; extremities are warmer than the surface of the body; clammy perspiration.

Quarter-past ten P.M.—Died suddenly; looks like a child who has been suffocated. Pupils dilated; body much warmer than it has been for the last three hours, and bathed in moisture. Urine, under microscope, presented a great number of blood-corpuscles, (specific gravity 10.11;) pale.

*Post-mortem Examination.*—Membranes of the spinal cord very vascular; spinal fluid very transparent; vascularity of cord general. Brain: General venous congestion, substance soft; nothing worthy of notice in the medulla oblongata. The papillæ of the tongue were much elevated and large, especially at the root of the organ; the mucous membranes of the pharynx and larynx, as far down as the œsophagus and glottis, were red, thin, and loose, and marked by a circumscribed transverse line about the base of the arytenoid cartilage. Most of the organs of the chest and abdomen were healthy; the blood was very fluid and very dark coloured, the upper lip being livid and discoloured, as with persons who die from submersion.

We alluded above to the unlikelihood of inoculation taking place, when the virulent fluid comes merely in contact with the mucous membrane; and we may now add that the truth of this statement is confirmed by a circumstance mentioned in this case. The report states that the owner of the dog, immediately he heard of the accident, sucked the wound inflicted upon the child; but although the latter died with undoubted symptoms of hydrophobia, this fearless man does not seem to have suffered from the contact which must have taken place during the act of suction.

It will be observed that the first symptoms of the disease appeared just at the period mentioned by authors—viz., thirty-two days after the introduction of the virus into the system, the horror of water being the first sign of the impending affection.

A very peculiar feature of the case is the consciousness in the young patient of the nature and cause of the fearful disease under which she sank. We are not aware that such knowledge is generally possessed by hydrophobic patients of so tender an age; and it will be noticed that in the case treated at King's College Hospital the unfortunate man did not make any remarks as to the nature of the complaint under which he was labouring, nor on the destruction of the dog. The child, on the contrary, repeatedly expressed great delight at hearing that the dog had been killed—a circumstance not in accordance with facts, but which was mentioned to the poor child, as stated above, to tranquilize her mind.

It will be observed that the patient could not be completely narcotized with chloroform; the spinal marrow was probably in so irritated and excited a condition, that the anæsthetic agent, usually so powerful, was not sufficiently so to conquer the spinal excitement. The failure of chloroform in this instance is a fact which should be carefully noted. Nay, the presence of feculent matter in the rectum exercised such an influence on the medulla, that each time an evacuation took place the child was constrained to jump up, being forcibly impelled by a violent spasmodic fit.

Nor was the spinal marrow alone affected; for the irritation, inflammation, or excitement, whichever it may be, soon travelled to the cerebrum; this circumstance giving rise to delirium, and the supposed existence of phantoms hovering before the patient. But with all the wandering, there was uppermost in the child's mind the remembrance of the bite, and the consciousness of her state, the poor creature calling out "I am mad because the dog bit me."

This idea of blood seems to have taken a firm hold of the patient's mind, for at one time she saw everything with a tinge of red; in fact she was constantly exclaiming that the bed-clothes, the walls, the dress of her mother, &c., were of a red colour.

Without giving any evident signs of violence, the child evinced the desire to injure by scratching, and made several attempts upon those nearest to her; still these fits were far less strong and marked than with Dr. Todd's patient.

We understand that the dog was not destroyed, because it did not subsequently evince any morbid symptoms; and it is stated in the report that the animal bit many children besides the one who was attacked with hydrophobia. No further misfortune seems, however, to have taken place; it may therefore be conjectured that the bites alluded to had no virulent property. Are we then to suppose that a dog may, in a state of excitement, without being actually rabid, inflict a wound which shall inoculate hydrophobia upon the injured person,

whilst the same dog may subsequently become perfectly harmless? Some authors incline to this opinion, and we find that an Italian physician, M. Baruffi, has mentioned a case in point in a late number of the "Annali Universali di Medicina." The case is headed thus: "Can the bite of an irritated, but not rabid, dog inoculate hydrophobia?" The question is answered in the affirmative by the writer, the details of the case being as follows:—

The patient was a woman, forty-four years of age, just recovering from illness, and still weak. She gave a kick to a dog who came to seek for shade in her house, as she wanted to drive the animal away from her children. The dog, irritated by the ill-usage, turned round and bit her foot, and kept hold of it until forcibly dragged away.

The wounds on the foot healed in thirty days, and were not at all indolent. Fifty days after the bite (October 20th, 1849,) the patient felt severe pain in the foot, shooting up to the trochanter. The cicatrices swelled up, became surrounded with a brown areola, and the muscles of the thigh were attacked with spasms. In the night she had convulsive movements, and groaned much.

On the next day the patient felt choked, and was thirsty, but had an invincible horror of all fluids. When taken to the hospital, she presented the same symptoms in an aggravated degree; the pulse was flagging, there were convulsions, violent coughing, and much spitting, to clear the throat.

On the third day, the features were drawn, the strength gone, delirium supervened, the muscular system was benumbed, and all voluntary movement was at an end, except that of spitting violently; pulse feeble, respiration short and noisy, with mucous rales, and finally exhaustion and death.

Efforts were made to ascertain whether the dog which had inflicted the wound was in a rabid state. The result of the inquiry was, that the animal, just before it had bitten the patient, was lying down and asleep, not the slightest signs of disease having been evinced, as was confidently stated by persons who had seen it for several days up to the time of the accident.

M. Baruffi expresses his complete conviction that his patient died of hydrophobia, and thinks that the virus may suddenly be formed by the action of anger upon the nervous centres. He considers that examples of humoral alteration, under the influence of great nervous perturbation, are not rare, and cites sudden icterus produced by terror, violent vomiting in hysteria, fetid perspirations in convulsions and epilepsy, &c. The author also mentions the experiments of M. Bernard, who, by irritating a limited portion of the medulla oblongata, could in a few moments increase the secretion of sugar by the liver. It is also known that fear or a fit of anger have suddenly so deteriorated the milk of wet nurses, that the suckling was attacked with convulsions, or even perished, soon after drinking the altered milk.

It would therefore appear, according to M. Baruffi, that the salivary fluid of the dog may, under the influence of anger, become suddenly impregnated with the hydrophobic virus. The author tries to explain the non-appearance of rabid symptoms in the dog, after the patient had been bitten, by supposing that the poison was dispelled by the action of biting, the drinking of water, the chewing of grass in the fields, picking a bone, &c. &c., by which means he thinks the dog may have cleansed his mouth from any virulent saliva.

Though these are all gratuitous suppositions, we are driven, when considering the facts of the case treated at Charing-cross Hospital, to adopt some hypothesis of the kind; for there can be no doubt whatever that the child was bitten by a dog which showed no signs of rabidity, either before or after the accident; that the animal was not destroyed, and that it bit several other children who have not presented any symptoms of hydrophobia. It will be of some use just to record these circumstances; the knowledge of them, along with the data which may yet be collected, will perhaps lead to the eventual solution of this intricate question. We would, in the meanwhile beg to close our report by stating that, in the *Dublin Medical Press* of the 9th of August, 1854, a case of hydrophobia will be found, in which many of the symptoms above described have been observed.

**BOURNEMOUTH SANATORIUM.**—The sanatorium erected by a committee of subscribers at Bournemouth, Hants, is now nearly completed. It will accommodate forty-four patients, twenty-two of each sex. The upper story will be for males, and the lower story for females. Each floor will comprise two wards, the size of which will be forty feet by twenty, with a corridor, twelve feet wide, running the entire length of the building, and adapted for exercise in unfavourable weather.

RECORDS OF THE RESULTS OF  
MICROSCOPICAL AND CHEMICAL ANALYSES  
OF THE  
SOLIDS AND FLUIDS.  
CONSUMED BY ALL CLASSES OF THE PUBLIC.

## PORTER, AND ITS ADULTERATIONS.

(Continued from p. 155.)

In order to save repetition, and to enable the reader more readily to comprehend and contrast the results of the different analyses, we have arranged them as displayed in the tables on pp. 228-29.

From the examination of these Tables of Analyses it appears—That the samples of stout either obtained from agents, or purchased at the taps of several of the principal London porter brewers, were considerably stronger than those procured from publicans; the alcohol, of specific gravity  $\cdot 796$ , temperature  $60^{\circ}$  Fahr., contained in the former samples ranged from  $7\cdot 15$  per cent. the highest, to  $4\cdot 53$  the lowest; whereas that of the stouts procured from publicans varied, with one exception, from  $4\cdot 87$  per cent. to  $3\cdot 25$  per cent.

That the same difference of strength also characterized the various samples of porter procured from the two different sources; the amount of alcohol in the porters obtained from the taps varying from  $4\cdot 51$  per cent., to  $2\cdot 42$  per cent.; whereas those purchased of publicans ranged from  $3\cdot 97$  per cent. to  $1\cdot 81$  per cent.

There is reason to believe that the variation would have been still more considerable had the samples been procured direct from the several breweries, instead of, as in most cases, from the brewers' taps.

This diminution of strength in the beer purchased of publicans is only to be satisfactorily explained by the addition in many cases of water, this addition being no doubt sometimes practised by the publicans and other retailers of malt liquors.

The addition of water constitutes the principal, but not the only, adulteration to which these beverages are subjected.

Thus the addition of water reduces the strength, flavour, and colour, to such an extent as to necessitate in some cases the further adulteration of the beer, and this is usually effected by means of a very coarse description of brown sugar, containing much treacle, and known as *Poots*, and salt.

Since the use of cane sugar is permitted in the brewery, we did not attempt to ascertain which of the samples subjected to analysis contained that substance, because, had we found it in any of the samples, we should still have been unable to have declared whether the brewers or the publicans were the parties who made use of it. We believe, however, that the brewers do not often employ sugar, since it is alleged that beer made with any considerable proportion of cane sugar does not keep so well as that prepared from malt only. Moreover, the price of sugar forms an obstacle to its use in breweries.

It appears, from the analyses, that salt is almost constantly present in porter. This addition we know is made in the first instance by the brewers themselves; but there is also no doubt that a further quantity of it is frequently used by the publican to assist in bringing up the flavour of beer which has been reduced in strength by the addition of water. The quantity of salt contained in porter is often sufficiently large to communicate a perceptibly saline taste to the mouth. The salt is used by the brewers in the following manner:—It is first mixed up in a tub with some kind of flour—usually wheat-flour—and the mixture is cast by handfuls over the surface of the wort in the cooling vat. It is said to assist in the preservation and fining of the wort, and it is alleged that these are the only purposes for which it is employed by the brewer.

The three usual and principal adulterations of porter consist, then, of water, by which its strength is reduced and its bulk increased, and sugar and salt, whereby its colour and flavour are in a measure restored. But there is good reason for believing, from evidence given before the recent Committee of the House of Commons, of which Mr. Villiers was the chairman, that other adulterations are practised, and that sulphuric acid, (or oil of vitriol,) salt of steel, (or sulphate of iron,) and cocculus Indicus, are likewise not unfrequently used, and this principally by the publican.

Not only is the fact of the addition of water proved by the present analyses, but evidence of another character has been supplied by different parties to the Committee above referred to, showing the same fact. In particular, it has been proved that a publican could not afford to sell porter at the price which he pays for it, in the state in which it is supplied to him by the brewers, and realize a profit upon it, unless he had recourse to adulteration.

The acidity of porter, as will be seen by referring to the analyses, is very considerable, and this is no doubt the reason why in some cases the beverage disagrees with the stomach, and occasions heartburn.

The acidity is very far from being due to acetic acid alone; for if this be distilled off, the remaining stout or porter, as the case may be, will still be found to be very acid; the acidity, where sulphuric acid has not been used, depending upon the presence of some fixed vegetable acid or acids, and most probably the malic and lactic acids, the presence of which would explain why malt liquors, including porter, are unsuited to all cases in which a tendency exists to rheumatism or gout. The large quantity of acid, and also sugar, contained in porter and other malt beverages, render them also unfit for nearly all cases in which any disposition to diabetes is manifested. The difference in the quantity of acetic and fixed acids in any sample of porter may be thus determined:—A weighed or measured quantity of the porter should be taken, and the amount of a solution of either caustic soda or dried carbonate of soda of known strength required to neutralize it ascertained; a similar quantity of the same porter should then be submitted to distillation, and the acidity of the residue determined; the difference in the amount of soda required in each case shows the quantity of fixed and volatile acids present.

In one respect the analyses above given may be considered to be satisfactory, inasmuch as they show that salt of steel or sulphate of iron is not usually contained in London draught stouts or porters, nor in most bottled porters; if used at all, as it no doubt sometimes is, it is in the inferior bottled porters that it will be found. From experiments which we have made, we have ascertained that when sulphate of iron is present in porter, in so small a proportion as two grains to a nine-gallon cask, the well burned ash of the extract of the porter will be found to be more or less coloured with the red oxide of iron. This is a very delicate means of determining the presence of iron in porter extract; and if iron in the above small quantity be found in it, there will be every reason for suspecting that sulphate of iron has been added to the beer; for the ash of genuine porter extract is never in the slightest degree coloured, but is always, when well freed from carbonaceous matter, either white or greyish-white.

We should also state that we made full analyses of two samples of finings obtained from different brewers, and found that they consisted entirely of weak and very sour beer, holding, dissolved, a considerable quantity of a description of isinglass, which was readily precipitated by a decoction of oak bark.

The remedy by which the adulteration of malt liquors may be met appears to us to be clear and simple, and it is one to which we recently had the opportunity of directing the attention of the Committee of the House of Commons on public-houses; it is, that no malt liquors should be permitted to be sold by any publican under certain fixed or standard strengths, the tests of strength being the specific gravity of the beers, but principally the amount or per centage of alcohol contained in them.

Such a regulation, properly enforced, would effectually put a stop to the adulteration of malt liquors, by the addition of water, sugar, salt, and the other substances mentioned in the present report; and it need not in any way interfere with the different recognised strengths and qualities of malt liquors now in use, as single and double stouts, ales, and porters.

The next Report of the Analytical Sanitary Commission will be on

G I N,  
AND ITS ADULTERATIONS.

## Reviews and Notices of Books.

*Practical Observations on Conical Cornea, and on the Short Sight and other Defects of Vision connected with it.* By J. NOTTINGHAM, M.D., F.R.C.S., &c. London: John Churchill.

ALTHOUGH it must be allowed that the most valuable portion of our medical literature is found in monographs, yet the present book suggests a doubt whether this mode of conveying information may not be carried to excess. There is scarcely a student, however zealous and anxious to master the wide and daily-expanding field of investigation opened out before him, who would not feel that his task was becoming arduous indeed, when a very rare disease of a single tunic of the eye requires for its development a work consisting of 260 large pages. The work before us is evidently written by a clever man: a confessedly rare and obscure disease has been grappled with; original cases have been carefully recorded; the literature of Europe has been ransacked every theory or hypothesis as to the cause and the morbid anatomy of the disease is discussed; every suggestion as to treatment is described. And yet there are some serious defects in the work: though rich in information, it sadly wants arrangement and condensation. The reader is presented with the readings and musings of the author, and the materials out of which the work should have been built are scattered in rich and chaotic profusion before him. There is abundance of ore, but the reader has to provide the crucible. No chapters are given, nor even a table of contents. After these remarks, it will readily be conceived, that to present our readers with anything like a summary or digest of the work would be attended with considerable difficulty, even if our limited space permitted such an attempt. We shall therefore imitate the plan of our author so far as to offer some cursory remarks that were suggested by the perusal of the work.

One of the most interesting questions connected with the curious and rare disease of conical cornea is the morbid change upon which it depends. First. Is there atrophy or hypertrophy of the corneal tissue? Secondly. Is such change in the cornea the cause of the cone, or merely one result of a previous abnormal condition of the eye? Thirdly. Are these changes the result of defective nutrition, or of inflammatory action? It is difficult to arrive at the opinion of the author upon these points. Cases are quoted, and the views of several writers are given, exhibiting remarkable discrepancy on these points; and it must be admitted that the opportunities of resorting to post-mortem examinations are exceedingly rare. The preponderance of evidence adduced is in favour of the doctrine that the cornea is thinned towards its centre from defective nutrition, and that this is the cause of the abnormal change; and in this view we are disposed to agree. We think that cases of softening and bulging of the cornea, from inflammatory action, are widely different from the disease now under consideration; and though largely quoted and dwelt upon, and mixed up with true conical cornea, we believe the subject is only complicated and confused by bringing together the two diseases. Thus, at page 98, a case of severe injury, with opaque, dislocated lens, and wound of cornea, is quoted; and at pp. 126-7, cases of ulcers of cornea, with partial staphyloma; and at another place, a case of staphyloma of the sclerotic is given. We must think that the subject is not only unduly expanded, but mystified, by grouping together diseases so different in their very essence. The author gives us two original remarks on this division of the subject. In accounting for the occurrence of conical cornea, he says:—

"It is not difficult to conceive how a disturbance of the *nexus formativus* (an arrest of development) may give to the child and to the adult an anatomical condition which properly belongs to an earlier era, by introducing the embryo type to a stage of existence behind the scene of which it ought to have

been left, and presenting that as a morbid condition in man which at one time may have been a natural or normal state during intra-uterine life."

This is a long and obscure sentence, but the thought contained in it is both original and ingenious. Again, the author suggests that, if the alteration in the shape of the cornea were due to thickening of the apex, that it would in fact be converted into a small magnifying glass, that would alter the appearance of the pupil and iris, which is not found to be the case. The question of treatment is discussed in a very philosophic spirit, and with no bias towards any particular plan; indeed the fault is rather the admission of every suggestion, however far-fetched; in proof of which we would refer to the American *invention*, at p. 210; and to Florer's suggestion, of draining away part of the aqueous humour by means of a fine seton. On this point the author wittily remarks,—“That the sight of the patient may hang on a very delicate thread.” We would venture to go a step further, and predict that the sight of the patient would inevitably be suspended and ultimately destroyed by such a proceeding. The author makes some ingenious suggestions with regard to the optical management of conical cornea, and seems to have been very successful in some of his own cases, and he very properly urges that all such contrivances should be exhausted before recourse is had to surgical operations. He then quotes all the various experiments that have been made to obviate this condition by operative means, even mentioning Himsly's plan of transplanting the cornea, and Trueshaum's suggestion of “glazing” the cornea, which consists in making a small slit in the cornea, and introducing a little glass button, or rather stud, in such a way as to fix it in the slit, and thus let in a small window. What a pity it is that the human eye so resents the presence of a foreign body!

We have now rapidly glanced at some of the more important points discussed by Mr. Nottingham, and have endeavoured to give some faint idea of the character of his work. In conclusion, we would suggest to him, when he again appeals to the public, more condensation and arrangement, the exclusion of such cases as have nothing whatever to do with the subject, the cultivation of a brief and clear style of writing, and the firmer assertion and development of his own opinions; and we venture to predict that, with the talents he possesses for research and observation, he will attain to a high professional position and a well-earned literary fame.

## ALLEGED CHOLERA AT YORK.

To the Editor of THE LANCET.

SIR,—An impression having gone abroad that this city is now being visited by this dreadful epidemic, to allay the public mind, we, the physicians and surgeons of the city of York, certify that no case of Asiatic cholera has occurred under our observation, and that the health of this city is in a better state than usual at a corresponding period of the year.

THOMAS LAYCOCK, M.D.,  
Physician to the York Dispensary.  
RICHARD HEY, F.R.C.S.,  
Senior Surgeon to the County Hospital.  
WILLIAM ANDERSON, M.R.C.S.,  
Sheriff of the City.  
JAMES ALLEN, M.R.C.S.  
GEORGE HORNBY, M.R.C.S.  
W. BIGLAND, pro W. D. HUBBARD, M.R.C.S.  
W. D. MANN, M.R.C.S.  
EDWARD ALLEN, M.R.C.S.  
WILLIAM COATES, M.R.C.S.  
GEORGE SHANN, M.D.,  
Physician to the York Dispensary.  
JAMES PALEY, M.R.C.S.  
WILLIAM PROCTOR, M.R.C.S.

## THE LANCET.

LONDON, SATURDAY, SEPTEMBER 30, 1854.

PERHAPS the greatest blessing possessed by Great Britain is its patrimony of nearly 400 square miles of coal-field. Certainly a great proof of its commercial activity and domestic comfort is that the inhabitants should burn away thirty millions of tons of coal per annum. There is no possessing any amount of wealth, intellect, or power which can free an inhabitant of our damp and foggy island from a subjugation to the coal-cellar; and there should be no mistakes, either of self-interest or of humanity, allowed to increase the blackness of our necessary servitude. Nevertheless, Mr. COOPER\* reminds us that they do so, and that, though we have done something for the factory child, the climbing boy, and the tramp,—though the common lodging-house is no longer a den, the factory no longer a fever-nest, and the puny sweep is freed from the inhumanities which were practised on him, yet that the collier is left to grope his own careless and reckless way through his talpa-like existence, the consequence being that, in the course of thirty years, nearly an eighth, or 30,000, of the workers in our mines perish prematurely. A short time ago a few individuals became astounded at a fact like this, drew up a petition, got it signed by 3000 persons, and presented it to the House of Commons, praying for inquiry, and basing its claims to special consideration on the ground that 1000 lives are annually destroyed by explosions and analogous mining contingencies. From the data given by Mr. COOPER, we find there are not less than 250,000 colliers in Great Britain, the average working life being about thirty years; 4·5 per 1000 per annum perishing from violence. In some of the counties the rate is yet higher, being in Lancashire and Herefordshire 5·2 per 1000. In Prussia the deaths from accidents in coal-mines are only 1·6 per annum, and in Belgium 2·8, so that the mortality of miners in England is twice as high as it is in Belgium, and four times as high as in Prussia. As the Officer of Health of Southampton remarks, this is a fearful mortality; it is not an ordinary evil, but a very serious one, and of national gravity.

"It cannot be too soon or too firmly grappled with, as the cost of existence in these days of advancement and increased estimation of human life cannot be trifled with without interfering with many important interests and considerations of the greatest magnitude to the social and material welfare of the State."

Mr. COOPER conceives that the most effectual way of remedying the evil would be by placing the whole mining supervision in the hands of competent Government authority, a specific department for the purpose being connected with the Board of Health. Mr. MACKWORTH has shown† that the destruction of life from accidents in mines is generally small, compared with the injuries and the shortening of life inflicted by the want of sufficient ventilation and other minor and preventable causes; and that there is every probability that the lives of miners in the majority of coal mines, in the iron, tin, copper, and lead mines, are shortened from twelve to fifteen years, on an average, by circumstances which are in a very

great measure remediable. Mr. COOPER maintains that no mine need be unhealthy from defective ventilation, and that choke-damp ought not to occur, its existence being proof of culpable negligence on the part of the managers. If such be the case, there is much to answer for, indeed, under the present method of working our underground passages. A scientific system of ventilation, rigorously and constantly carried out, to supply fresh air to the workmen, and to diminish the great heat experienced by them in their work, is of course a main remedy for the present evils, but is not the only one necessary to be instituted. The miners themselves have to be taught the true purport and right management of a "Safety Lamp," and to be most closely supervised as to their conduct in respect to this instrument. We doubt, indeed, whether the ignorance or even carelessness displayed by the miners, is not very greatly inferior to their reckless bravado. If men in deep workings, or at great lateral depths, in contact with closed excavations perhaps imperfectly walled off, or contiguous to large fissures or broken places from which jets of gas escape and charge the surrounding air with matter ready to explode, will, in complete knowledge of their danger, burn *lucifer matches*, and smoke tobacco, or go on working until the light will scarcely illuminate from the deficiency of oxygen, or mend the mesh-work of their lamps with lead, or pewter, or some material which melts off, or becomes detached, we fear something more than instruction—viz., severe disciplinary supervision, must be rigorously enforced ere benefit will result. Men who will carry a lighted candle in their hands, or even fix it in their hats, near what has been termed "a magazine of explosive gas," are beyond the *suaviter in modo*, and must be managed by the *fortiter in re*. It has been laid down by a high chemical authority, that "The strongest explosive mixture might come in contact with iron or other solid bodies heated to redness, or even to whiteness, without detonating, provided they are not in a state of actual combustion."

According to Mr. COOPER, who, in connexion with Mr. SHARP, of the Southampton Gas Works, has instituted some experiments on this point, he has seen "again and again immediate ignition of carbureted hydrogen by heated iron and "hot cinders," and for this the iron, coal, and cinder need be no more than in a state of red heat.

"If," says the former gentleman, "a diver can descend to the depths of the ocean, and be supplied with air, there can be no reason why the miner should not have it both in purity and abundance. . . . Two gallons of pure air per minute are necessary for healthy respiration, and this may be easily supplied by proper apparatus to any mine, however deep, and whatever the number of men may be."

In one sense this may be all true enough, and we believe that for some time past mining engineers would have found no difficulty in effecting it, if they had had at their command plenty of money. This, in fact, was the great stumbling-block; managers wished to drive levels and work seams as cheap as possible, and not as scientifically or perfectly ventilated as their engineers could have effected. It is true that managers have often been "penny wise and pound foolish." For example, in Mr. MACKWORTH's communication to the Society of Arts, it was shown that in some mines where the ventilation had been improved, the men acknowledged they could do one-fourth more work. In one large mine last year there were three sets of men driving a level at a cost of seventeen pounds a fathom. The temperature was 105°, and the hands were

\* Ventilation of Coal Mines. By Francis Cooper, Surgeon, Officer of Health, Southampton. Southampton: 1854.

† Report of Society of Arts, *Athenaeum*, July, 1854.

changed every five minutes. At the request of a member of Parliament — Mr. WILLIAMS — Mr. MACKWORTH visited the miners, and pointed out how a quantity of air might be introduced sufficient to lower the temperature to 75°. It was done, and the level then cost *five* instead of seventeen pounds per fathom. If the heat be very great, or above 100°, sometimes the men cannot work in it at all, or only for a very short period; they must, in driving such a level, or working such a seam, be constantly replaced, or die.

The method of ventilation proposed by the Southampton Officer of Health is the traversing the mine with two sets of gutta percha tubing, one set for carrying the pure air down, the other for bringing the foul air up from the pit. A powerful bellows, worked by steam-power, would transmit the air from above through the tubular distributory. The latter is to be provided with proper perforations, valvular openings, &c., and the bellows is to be preferred to the fan or the screw; but on these matters of detail we need not enter. The plan now recommended was suggested to the chairman of the Parliamentary Committee, (Mr. J. B. HUTCHINGS,) as "both a cheap, simple, and effectual plan, and one to which there can be no valid objection on the ground of difficulty or expense." The chairman, in his reply to the proposal, stated that he had had two or three plans submitted to him very similar in principle, and not very dissimilar in detail from that we have just noticed.

It is to be presumed that, after the conclusive evidence as to the pernicious effects of castor oil in Cholera collected by the Council of Health, and published under the authority of Sir BENJAMIN HALL, the public mind will be freed from the fatal delusion that that drug is the remedy for Cholera. In addition to the evidence referred to, and which has been presented to the public, we are authorized to state that more extended inquiries, made throughout the metropolis by the Inspectors of the Board of Health, have brought to light a still larger mass of confirmatory evidence; and that the testimony to the disastrous results of the late prevalent faith in castor oil and purging, as the cure for Diarrhoea and Cholera, is uniform amongst all observant members of the profession. The history of this delusion offers a memorable example of the evil of medical prescribing in the newspapers. Some medical men, losing sight not only of professional decorum but of their duty to the public, have rashly joined the host of old women and dabblers in quackery, of every sort and condition, who have flooded the daily press with "certain cures" and "infallible specifics." If not actuated by a dishonest hankering after notoriety, their conduct can only be explained on the supposition that they think medical science likely to be advanced by public discussion in the newspapers. This is tantamount to advocating universal suffrage in Medicine. The folly of this principle of action is as reprehensible and pernicious as is the knavery of the former. Our contemporary, the *Spectator*, in referring to the report of the Council of Health, very acutely observes:—

"It is indiscreet for medical men to discuss their own first ideas in the unprofessional public journals. A most respectable physician has been prescribing castor oil for Cholera with an apparent success, but in a very limited experience. Several others copy him; and at last the Board of Health puts the prescription to a more rigid test. Out of eighty-nine cases the remedy proved undecided in six, still in course of treatment, successful (?) in fifteen, fatal in sixty-eight. Was not the rash

adoption of the drug the direct result of newspaper consultation?"

But, as we have before said, this summary is very far indeed from conveying an adequate idea of the mischief that has been done. Many hundreds of misguided persons affected with the diarrhoeal stage of Cholera have, fancying themselves in possession of a sure specific, deferred seeking for skilled advice, and trusting to "that simple remedy," castor oil, have perished by their own hands.

Striking, demonstrative, and fearful as is the lesson taught by the *currus triumphalis* of castor oil, we dare not venture to hope that it will arrest the vain egotism and culpable precipitancy of those amateurs who delight in obtruding their silly advice; but it may at least serve for a warning to the public to consult their regular medical attendants when they are ill, and not to look for medical advice in political newspapers.

ALL of us remember how profoundly, a few years ago, the female mind in this country was agitated by the Bloomer crusade. The cry went forth from the women of America to the women of England, calling upon them, as they valued their freedom—or, rather, their supremacy—to rebel against the yoke which was supposed to be typified in their petticoats; to revolutionize the time-honoured but despotic millinery-regulations; and to put on, as the symbol of their independence and of their equality with tyrant man, that garment of the nether limbs which it is considered indelicate to describe by name, but which hitherto had been wrongfully and despotically appropriated to the male sex. The philosophical and skilful Amazon, Mrs. COLONEL BLOOMER, who had assumed the conduct of this great campaign on behalf of the rights of women, had accurately fathomed the influence of dress upon the mind. The ingenious author of "Sartor Resartus" himself did not more fully appreciate the importance of external decorations as instruments for subjugating the intellect of mankind, than did the gallant COLONESS when she boldly unfurled before her down-trodden sisters, as the standard of revolt, that unmentionable garment which insolent men had oftentimes in ribald metaphor taunted them with surreptitiously wearing.

It is not our purpose to trace the succession of events by which the failure of the Bloomer costume was brought about. We still avow ourselves of the school of THOMAS CARLYLE. We still believe in the efficacy of dress as an agent in moral government. If the — (our readers must supply the word we are not at liberty to mention) are still worn only by a few of the more daring and determined of their sex, we can only conclude that the petticoat which Mrs. BLOOMER would discard and repudiate as unfitted to be the emblem of government is, in reality, the garment that is the most in harmony with the mental qualities that Nature has implanted in the female sex. But contemporaneously with this bold assumption of masculine attire there was at work, in the more advanced and disenthralled departments of the United States, a spirit of ambition more practical in its nature, that aimed at grasping not only the outward garments of man, but also at usurping functions which the tyranny of custom had assigned to him. Female Colleges of all kinds were instituted. The inherent right of women to academical distinctions—to enter upon the practice of the learned professions—was loudly proclaimed. Medicine, ever peculiarly exposed to the inroads of charlatany, was the first profession to tempt the zeal and the

ambition of the New Amazons. It had long been a subject of reproach that Medicine was degraded by the ignorant pretensions of "old women" of both sexes: why should it not be regenerated and honoured by *young* women of powerful and instructed minds? Accordingly we have witnessed the revival of lady-professors of anatomy, physiology, medicine, surgery, and midwifery; we have seen these lady-professors conferring the degree of DOCTOR of Medicine—we believe they pretermitted the lower grade of BACHELOR—upon the young ladies who have completed their studies; and, lastly, we have seen these lady-dubs, under their proper professional and academical appellations, driving about the enlightened towns of America in befitting broughams, expounding medical mysteries, giving advice, and taking fees! One of these lady-doctors, more ambitious than her professional sisters, not satisfied with the state of science in America, has laudably resolved upon improving her learning and her skill, by visiting the European Schools of Medicine.

A Miss Doctor BLACKWELL, a Graduate of Cleveland College, Ohio, having completed a course of clinical study at the Royal Maternity Hospital, at Edinburgh, has applied to the Managers of the Royal Infirmary for permission to prosecute her studies in the female wards of that institution. It is supposed that her intention is ultimately to eclipse the home-bred lady-graduates of America, by returning to New York with the degree of Doctor of Medicine of the University of Edinburgh, and the Fellowship of the Royal College of Physicians of London. That a purpose so praiseworthy should be opposed by the refusal of the Managers of the Royal Infirmary to accede to the request of Miss Doctor BLACKWELL, we cannot but regret. In order that Miss Doctor BLACKWELL may not return to America, there to propagate the injurious reproach against our national character, that we know not how to encourage females in the pursuit of medical knowledge and collegiate honours, we beg leave respectfully to inform her and her sister-graduates, that the Royal College of Surgeons of England is animated by a more enlightened and transatlantic liberality; and that the new order of Licentiates in Midwifery is open, by an Act of Parliament, to "persons" of both sexes.

SIR BENJAMIN HALL is likely to prove two things—1st, what a man can do; and 2nd, what he can not; and the latter feat in regard to his present operations may turn out to be the more useful of the two. Sir BENJAMIN is clearly not only disposed, but determined, as far as possible, to do his duty. He is zealous, active, attentive, and shows great administrative capacity. Few men have been placed in a more important, or in a more honourable position. His appointment was hailed as the *avatar* of a new era in Sanitary Reform; nor do we doubt that the President of the Board of Health, if allowed full scope, will fulfil the expectations which have been formed of him. He has surrounded himself with a zealous staff, and up to the present moment has endeavoured to do everything that could possibly be done with regard, not only to general measures of Sanitary Reform, but in order to meet the frightful pestilence which, just after his accession to office, burst on us like a thunder-storm. But his good intentions beat against an absurd legal system, like the sea against the rocks. What can he do with obstinate Boards of Guardians? He directs such and such things to be done through his inspectors; but sapient

parish authorities decline to do anything, and the only remedy is to indict them for a misdemeanor for violating the provisions of the Nuisances Removal Act. The inquest at Clerkenwell proves the insufficiency of the present system. There the more than carelessness of the guardians was abundantly proved. Their refusal to comply with the orders of the Board of Health through their inspector, Mr. GEORGE GLOVER, was clearly shown, and yet because the nuisance, which in all human probability had killed the child BUCKLEY, was a "*trade*," and not an ordinary nuisance, nothing could be done!

At an early period it is probable that our readers may find in these columns some practical suggestions calculated to meet the numerous defects of our present sanitary system.

We repeat that Sir BENJAMIN HALL, by showing positively and clearly what even *his* administrative powers cannot accomplish, is likely to ensure, or promote at least most materially, the success of the cause of Sanitary Reform, perhaps one of the greatest causes of the age.

### THE MOUNTAIN-ASH BERRY A SUBSTITUTE FOR THE APPLE.

To the Editor of THE LANCET.

SIR,—If the following suggestions should be deemed worthy of a space in your journal, they are much at your service:—

The author of a work, entitled, "On the Use of Vegetable and Mineral Acids," &c., has, I think, proved from his own observations, and those of others, that the inhabitants of cider counties are to a great extent free from attacks of cholera. If such be the case, and I have nowhere seen the question disputed, would it not be a matter of policy to cultivate the apple tree throughout the country more generally than it now is, so that populous places might be better provided with the wholesome beverage, cider? How this may be accomplished I must leave to those who dwell in the country. I should imagine that, in the hedges of almost every field the apple tree may now and then appear. There is often, I find, a great scarcity of this fruit, which I believe is the case this year. The multiplicity of apple trees may provide against the occasional failure. It is sometimes remarked,—"*There is only half a crop.*"

Besides the apple, there is another fruit, or berry, which, it appears, yields half its weight in juice. The berries of the mountain-ash are stated to produce pure malic acid,—(See "Hooper's Medical Dictionary.") Under the head, *Sorbic acid*, Hooper writes thus:—("*Acidum sorbicum*, from *sorbus*, the mountain-ash, from the berries of which it is obtained.) The acid of apples, called malic, may be obtained most conveniently and in greatest purity, from the berries of the mountain-ash, called *sorbus*, or *pyrus aucuparia*, and hence the present name, sorbic acid. This was supposed to be a new and peculiar acid by Donovan and Vauquelin, who wrote good dissertations upon it. But now it appears that the sorbic and pure malic acids are identical."

The mountain-ash, therefore, whose berries, hanging gracefully on its branches, are pleasing to the eye, may be made available, especially at the time of a scarcity of apples, by grinding them up with that fruit to make cider. I would therefore suggest that the mountain-ash tree should be more extensively cultivated throughout her Majesty's dominions. The seed, or berries, may be obtained at Covent-garden, London, or elsewhere, and I am told this is the period for procuring them, but I am not aware when they should be placed in the earth, nor how, so as to produce the tree.

I am, Sir, your obedient servant,

ARBOR.

September, 1854.

### PREMONITORY SYMPTOMS IN CHOLERA.

To the Editor of THE LANCET.

SIR,—It is only within these few days that my attention was called to the article in THE LANCET of the 26th of August, and to that of the 2nd of September, relative to the question of the

existence of a premonitory diarrhoea in cholera. Permit me to call your attention to the fact, that all the cases in the pamphlet you have noticed were cases reported in the Registrar-General's weekly return as cases of cholera without any premonitory diarrhoea, and that they were all so many errors propagated by that official return; and if you take the trouble to call on the Registrar-General, he will tell you, as he did me, that he is obliged to accept what information is given him as to the cause of death; that he has no authority to enforce accuracy on this point on the part of medical informants; consequently, no reliance is to be placed, as to the cause of death, on the Registrar-General's weekly return. And to satisfy you further that no confidence is to be placed in what appears in the Registrar-General's returns, in a pathological point, you have copied from him two cases of cholera, reported as cases without any premonitory diarrhoea, yet the first had a diarrhoea for twelve hours before the cramps set in; the second above four hours. The first patient resided at No. 45, Whittlebury-street, Camden-town, St. Pancras; the second at No. 58, St. Paul's-street, St. George's-in-the-East. I have not had time to inquire into the other cases mentioned in *THE LANCET*, and copied from the Registrar-General's returns, nor do I for the moment deem it necessary, as the following document, which has come to my knowledge within these few days, will satisfy all pathologists that cholera cannot take place without a premonitory diarrhoea:—

In 1849 I was in charge of Poplar Union, as a medical inspector. The form of a register to record the cholera cases was decided on, reporting, amongst other information, whether there was, or not, a premonitory diarrhoea. I am again a medical inspector of this union, and I find that the register has been carefully kept of all the cases of cholera which have occurred in Poplar since then, by the intelligent and zealous

clerk of the union, Mr. Symons; and I also find that Dr. Beem and Mr. Webb, the well-known surgeons to the union, have, from a sincere desire for the advancement of medical science, and also, as they themselves have told me, from a very sincere desire to find that I was in error in the rule I had laid down—that cholera is always preceded by diarrhoea—carefully examined every case of cholera since 1840, and that out of 746 cases which have occurred in this union, they have not been able to find one without a premonitory diarrhoea. I may add that I am seeking during the present epidemic, with all the care in my power, for cases of cholera without a premonitory diarrhoea, and that I am assisted in this inquiry daily by three-and-thirty medical gentlemen, and as yet we have not been able to find one which had not been preceded by a diarrhoea for some hours, some days, or some weeks, although we have examined some hundreds of cases.

I have the honour to be, your obedient servant,

D. MACLOUGHLIN, M.D.,  
Member of the Legion of Honour  
Bruton-street, Berkeley-square,  
Sept. 1864.

## TRACHEOTOMY BY MEANS OF A VERY SLIGHT ADDITION TO THE POCKET-CASE.

To the Editor of *THE LANCET*.

SIR,—If the scissors be prepared for tracheotomy, as proposed in your journal for June 17th, 1854, p. 648, a very simple instrument added to the pocket-case, which would take up little room, and be very useful for other purposes, is all that is required for the operation of tracheotomy.

It consists of a wire, flattened, bent as in the subjoined outline, and of the due degree of strength and elasticity.

It is flexible at *a*, and is bent at that part until *b* and *c* come together; it may be thin and flexible, too, at *b* and *c*, so that it may be brought nearly to a point for introduction into the tracheal opening. The parts *b* and *c* are of such a form as to admit of their buttoning within that opening. *Verbum sat.*

I am, Sir, yours truly,

September, 1864.

DELTA.

## THE TREATMENT OF CHOLERA BY PURGATIVES.

To the Editor of *THE LANCET*.

SIR,—I see in your number of September 2nd, a letter from a Mr. Burke, very pompously and wrothfully abusing "a Dr. G. Johnson," for stealing his very original and beautiful "Theory of the Nature and Treatment of Cholera." Now the aforesaid Mr. Burke must surely have been a hermit, or he would have known that dozens of medical men have advocated the same theory for the past twenty or thirty years. If I mistake not, Dr. Billing was the broker of it. Whatever may be the truth of the theory, I believe the purgative (of bowels, not of liver) treatment is contradicted by universal experience. Some go so far as to give salts, some elaterium; but I imagine if it was possible for a poor wretch submitted to such treatment to recover, it would be in spite of the treatment. We are apt to snarl at the quacks, but I think we ourselves, by acting on our silly conceits, instead of following the established plan of treatment, based upon the known pathological changes, are more likely to do harm than the whole of the said respectable fraternity. I see also another persevering gentleman, a Dr. Macloughlin, trying to prove that there is a rule without an exception—that it is impossible for cholera not to be preceded by diarrhoea. He seems bad to confute, for he will not be confuted. Your pages offer numberless contradictions to his notion. I remember a case last year, in which a man was out, taking a walk, quite well; I particularly ascertained that he had had not the slightest diarrhoea. All at once, he felt faint and sick; felt his bowels swell and rumble, and immediately sat down and purged gallons, as he said. When I saw him within an hour and a half after, he was sinking fast into collapse, and soon died.

I am, Sir, yours very respectfully,

South Shields, September, 1864.

No PECKENIFF.

## GALVANISM IN HYDROPHOBIA.

To the Editor of *THE LANCET*.

SIR,—In consequence of the statement in *THE LANCET*, that galvanism had proved ineffectual in cases of hydrophobia, I wish to be allowed to observe that it failed in consequence of being employed when the symptoms of hydrophobia had shown themselves. We can decompose organic poisons by a continuous current of galvanic electricity. It is therefore necessary to act upon the poison before it has become absorbed, and by applying the galvanic current immediately to the bitten part we destroy the poison by electrolysis.

To corroborate this statement, I will relate an experiment of Mr. Pravaz, who inoculated some dogs with the saliva of a mad dog, and allowed others to be bitten by mad dogs. Those which were galvanized recovered; the others died mad. Similar experiments will be found in *La Clinique*, 1829, No. 40; *Revue Médicale*, 1830, p. 463; Kleinert's *Repertorium*, bd. 4; Gerson and Julius' *Magaz.*, 1830, Mai, Juin; *Freier's Notizen*, 1830 and 1831; Henke, *Zeitschr. für Staatsarz.*, 1843.

I remain, Sir, your obedient servant,

Connaught-square, Sept. 1864.

R. M. LAWRENCE, M.D.

## THE CHOLERA.

RELATIVE to the progress of the cholera in the metropolis we condense the following from the "Weekly Return" of the Registrar-General for the week ending September the 23rd:—

Districts.	Elevation above water mark.	Population (1851).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	70
Central (St. Giles, &c.)	49 "	393,256	77
Western (Kensington, &c.)	28 "	376,427	216
Eastern (Shoreditch, &c.)	26 "	485,522	197
Southern (St. Saviour's, Lambeth, &c.)	6 "	616,635	724
			1294

Of these 373 were under 15 years of age; 698 were above 15 and under 60; 212 were above 60 years old; 1 the age was unknown.

190 are said to have died from diarrhoea.

The deaths by cholera in the ten weeks of the present eruption have been 8953; the eruption of 1849 broke out earlier, and by the same date, nearly, had destroyed 12,664 of the inhabitants of London.

We extract the following from the "Weekly Return" of September the 16th:—"At 26, Phillip's-street, on the 12th of September, the daughter of a coalwhipper, aged ten years, 'diarrhoea, (sixty hours,) cholera, (forty-eight hours.)' The Registrar says:—"In the week ending September the 9th, I registered the death of a child on the 6th, aged five months, from debility, in accordance with the medical certificate, and also the death of its mother, on the 5th, from typhus. Since then the father has called on me and stated that the child was still living; after laying in a moribund state four hours, and when about placing it in the coffin with the mother, they found it still warm; it has since rallied and eaten ravenously, and I believe is yet alive."

On the 12th instant, the general committee of the Metropolitan Commissioners of Sewers passed the following resolution:—"That the engineer, Mr. Bazalgette, do prepare for presentation to the general committee, at its next meeting, a special report, explanatory of the mode of conducting the works of the Commissioners in building and repairing sewers, and covering open sewers; the ordinary precautions taken for the prevention of nuisance and danger to the public health, and the special precautions taken at the present time; the general state of the works now being executed, and the state of health of the men engaged upon them; and as to the propriety of suspending the works for a period, and whether any and what additional precautions are requisite; and generally on the propriety of executing sewerage works during the prevalence of cholera."

In pursuance of the above resolution, Mr. Bazalgette has presented his report, for the details of which we have no space at present; suffice it to say, it is favourable to what has been done and is doing by the Commissioners.

We find by the *Lancaster Guardian*, that some cases have occurred at Lancaster and Poulton. The Board of Guardians are on the alert, a sanitary officer has been appointed, as also a staff of visitors, whose duty it will be to make a house-to-house visitation.

The sculptor, Pistrucchi, (a relation of a former mint medallist,) was lately seized with cholera at Rome, whilst occupied on some ornamental mouldings in the Papal palace. This, and some other few deaths have occasioned the introduction of a process of fumigation, to which all the visitors to the Papal palace are subjected.

On Monday week, Mrs. Fitzwilliam, the well-known actress, attended rehearsal at the Haymarket Theatre, was then attacked by the disorder, and died in a few hours' time.

Dobrich, the German musical composer, has also fallen a victim, at Augsburg.

The cholera has happily almost disappeared from the large towns of Piedmont. In Turin there were no fresh cases, and only two deaths; at Genoa six cases and six deaths. The total number of cases at Turin has been 642 and 410 deaths; and at Genoa 4827 cases and 2669 deaths. From this it will be seen that the scourge has been much more severe this year than on any former occasion.

Its progress, too, has been remarkable for capriciousness, avoiding those places which were most afflicted in other years, and *vice versa*. At Nice and Cuneo, in Piedmont, for instance, there have been but solitary cases this time; and at Messina, where it was never known before, upwards of 13,000 persons are computed to have died of it already, and it was still raging at the rate of between 200 and 300 deaths a day up to the latest accounts. It has, we are sorry to hear, at length made its appearance at Florence.

As may be supposed, "Contributions on Cholera" flow in upon us abundantly. Every one appears to desire to "have his say." We can only observe now that D. J. C. Atkinson's "experience of this relentless disease during three successive epidemics tells him that the physiognomy of the affection has exhibited different aspects," and hence "the treatment will never, in *hieroglyphic*, to be successful, be required to be uniform in nature under these varying circumstances." Still, Dr. Atkinson has "decidedly greater confidence in the administration of calomel, according to Dr. Ayre's plan, in extreme cases of collapse, than in any other mode of treatment." "C. H.," believing that this same plan (Dr. Ayre's) having "been found to be the most successful without the action of the mercury itself being displayed," thinks the beneficial effect may be due to the *chlorine* entering into the mercurial compound. He therefore advises the use of this agent, and as prepared according to the

directions given in "Watson's Practice of Physic." In the opinion of another correspondent, who signs himself, "A Bewildered Practitioner," if, as has been asserted, patients do frequently recover under the use either of castor oil or of small doses of calomel, "it only proves that the *vis medicatrix* is powerful in cholera as in other diseases;" while "Adelephoc," having no faith in the former, tells us that, "calomel and opium have been the best means he has to record, and occasionally when sickness has been severe, small doses of the diluted hydrocyanic acid has relieved it."

## Medical News.

QUEEN'S COLLEGE, BIRMINGHAM. — AWARD OF HONOURS.—*The Warnford Gold Medals*: (£20 each.) Mr. Porter, Mr. Heeley. *The Essays* of Mr. Wolston and Mr. Lee were honourably mentioned.—*The Governors' Gold Medals for Regularity and Good Conduct during a Period of Three Years*: Mr. Porter, Mr. Ardan.—*The Warnford Scholarships*: (£10 each, for Two Years.) Mr. Ruffe, First Scholarship; Mr. Bright, Second Scholarship.—*The Webster Prize* (£5) for Proficiency in the French Language: Mr. J. A. Williams.—*The Percy Prize* (£5) for Proficiency in the German Language: Mr. Abbey, Mr. Lyach, equal.—*Anatomy*: Medal, Mr. Snooking; Certificate, Mr. Jordan.—*Surgery*: First Medal, Mr. Fletcher; Second Medal, Mr. Harris.—*Medicine*: Medal, Mr. Jordan; Certificate, Mr. Heeley.—*Midwifery*: Medal, Mr. Heeley; Certificate, Mr. Spoda.—*Chemistry*: Medal, Mr. Bond; Certificate, Mr. Smith.—*Materia Medica*: Medal, Mr. Neal; Certificate, Mr. Hayward.—*Botany*: Medal, Mr. Bright; Certificate, Mr. Neal.—*Forensic Medicine*: Mr. C. R. Williams.—*Anatomical Demonstrations*: Mr. J. R. Davies.—*Elements of Medical Science*: First Prize, Books, Mr. J. A. Williams; Second Prize, Books, Mr. J. T. Smith, honourably mentioned.—*Classics*: Medal, Mr. J. A. Williams.—*French Language*: First Prize, Mr. Abbey; Second Prize, Mr. G. H. Harris.—*Mechanical Drawing*: Mr. Watts.—The presentations will take place on the 3rd of October, and an Address will be delivered by R. D. Grainger, Esq.

WHITECHAPEL COUNTY COURT, SEPT. 11TH.—GUNPOWDER PILLS.—LAUGHABLE CASE OF EMPIRICISM.—EAST-END CREDULITY AGAIN.—FLYNN v. GREEN.—This action was brought to recover the sum of £1 4s., for a quarter of a gross of Doctor Hippocrates's pills of life, and the proceedings convulsed the court with laughter. The plaintiff is an Irishman, assuming the name of Doctor Hippocrates, who it appears has been for some time carrying on a thriving practice in the delightful locality of Petticoat-lane. The defendant is a young beginner in the general line, whose patronymic is far from being a misnomer. Mr. W. B. Davies, the solicitor, appeared for Mr. Solly Green, and Doctor Hippocrates conducted his own case.

Mr. FLYNN, in true Milesian twang, said a frind of his wishing to befrind Mister Green, the chate, come over him as to appoint him agent for the sale of his pills of life, and to credit him for a quarter gross of them. Upon his sending his assistant, Mister Leary, for the chips, (laughter,) Mister Green offered back the pills, and as he still backed out, he took a summons out.

Mr. DAVIES.—Pray, Mr. Flynn, how comes it you describe yourself as a medical man, Doctor Hippocrates, eh?

PLAINTIFF.—If I choose to call myself Lord Chancellor, Prince Albert, or the Emperor of Russia—where's the law to prevent me? (Laughter.)

Mr. DAVIES.—Oh, then, you are not a physician, (laughter,) but I see you are a bit of a poet. Is this your composition on the lid of your pill boxes?

"If you wish to live for ever, my boy,  
Take these pills and life enjoy;  
Wondrous cures these pills have done,  
They've turned the father into son.  
The blind to see, the lame to walk,  
They've also made the dumb to talk."

(Roars of laughter.) Now do you mean to swear, Dr. Hippocrates, that your pills have the wonderful properties these lines convey?

PLAINTIFF.—Mister Burke writ them verses for another doctor, some time ago; but faith my pills, I'll be bound to swear, will cure all diseases of baste or man, woman or childer. (Loud laughter.) Ye'll excuse me, sir, offering ye a box to test their virtue. Y'er rather bilious about the eyes, I percave. (Dr. Hippocrates here, amidst a shout of laughter, held out to defendant's attorney a box of the pills of life.)

Mr. DAVIES.—Not for the world. Do you know we have had your pills analyzed. I only wonder you have not been tried for murder in administering them. (Roars of laughter.) Now, come, tell me where your pills are manufactured?

PLAINTIFF.—The medical min don't manufactur—we dispinse. (Laughter.) My laboratory—that's the proper word, sir, not manufactory—is at home, sir. (Laughter.)

Mr. DAVIES.—Have you any objection to state what your pills are made of. Come, now, I know: are they not made chiefly of gunpowder? (Shouts of laughter.)

PLAINTIFF.—The Lord presarve us, gunpowther! Be careful what you say, and not take away my carrickter. (Laughter.)

Mr. DAVIES.—Yes, gunpowder, or at least its components, we find in your pills of life. There is one thing, however, we cannot make out. I think it looks like a spider's web. Is that so? (Laughter.)

PLAINTIFF.—I am not such a gossoon as to tell ye the likes of my pills. I niver made gunpowther, nor do I know how it is made, and d'ye think I want to blow sick people up with gunpowther? (Laughter.) The Lord presarve you, sir, I'm not a haythen, like a lawyer. (Loud laughter.)

Mr. DAVIES.—Well, as you will not divulge the contents of your pills, I must. Our answer to this case is that the claim is about as impudent as the plaintiff is by assuming the character of a medical man. It is almost surprising how the public are gulled by quacks; and had a witness attended—prevented by illness from being here—we should have been able to have proved that these pills are dangerous to life. His foolish client fortunately sold none of them, and discovering the character of the pills, sent them back. The analyzation proved that the pills were chiefly made with gunpowder, and all a person had to do after taking them was to swallow a lucifer match and he would at once become a skyrocket, and eased of all pain in this world. (Laughter.) Mr. Davies here broke up some of the pills and rolled the mixture up in paper like a squib, and with a lucifer match lighted it. In a short time it burnt and fizzed like a slow match. He urged upon the court that this was ocular proof that the pills were a downright cheat, and that his client was justified in returning them.

The JUDGE.—Well; in the whole course of my experience, I may with truth assert, a case like the present never came before me. Are the East-end people mad? One would think so. Why, the pills remind me of the Devil on two sticks. (Loud laughter.) I shall certainly order them to be impounded, and ascertain whether they are dangerous to life. As it is I have no hesitation in giving a verdict for defendant, with costs.

Doctor Hippocrates assured the court that his pills were harmless, and convulsed the court by swallowing at least a dozen. Our reporter tasted one of the pills, and it appeared to be nitre and sulphur; it was not black enough to be gunpowder.

THE ARMY SURGEON IN CAMP.—A correspondent, writing from Varna under date of September 3rd, thus speaks of the life which an army surgeon leads during a campaign:—"Before leaving this place, I visited the General Hospital. It is so full that the medical officers are worked off their legs. I was amused at the remarks of a surgeon, yesterday. He was speaking of the service, and said: 'What! do you ask why I am working with my arm in a sling? I will tell you. Because I am an army surgeon, and he is never allowed any sick leave. It is a principle in our department that whenever the mind seems depressed and the body weak, the carcase must ever be retained. It is seldom that we are supposed to require rest in bed, when others in our state would be dead. We are only supposed to quit the surgery for our couch; and even when in *extremis*, the carcase must put its sign manual to public documents. Remember this: an army surgeon's carcase can never seek home on sick certificate.' Poor fellows! I never saw such laborious work. Imagine a man with eighty severe cases of fever, dysentery, and ague, receiving official information that he must take charge of a hundred men who will shortly arrive from the Light Division. I am afraid that ere many days are gone we shall find our doctors very far from the number required."

INQUEST TWENTY-SIX YEARS AFTER DEATH.—A most extraordinary occurrence has happened within the last few days at Redruth, in Cornwall. As long ago as the year 1828, a miner, named Williams, was working in Pednandrea mine, near Redruth, when he fell, together with his brother, into the shaft. His brother, after falling about twelve feet, contrived to stop his further descent, but the deceased fell further down, and a quantity of rubbish toppled down upon him. Though every exertion to recover the body was made for a period of two

months, it could not be found, and the shaft was then closed over. In this state it remained till April last, when a company was formed to resume the working of the mine, and, in clearing one of the levels the other day, the body of the deceased was found, lying on its left side. It had on a blue coat, with metal buttons, a coarse woollen shirt, and shoes and stockings. On its being brought to the surface, deceased's brother, who fell with him into the shaft, and who was then present, was so affected, that his conduct for a while was like that of a madman. The jury returned a verdict of "Accidental Death." The burial of the body was witnessed by upwards of 4000 persons. —*Times*, September 25th, 1854.

MILITARY AND NAVAL INTELLIGENCE. — APPOINTMENTS.—John M'Leod, M.D., (1847,) to the *Furious* (16) steam-frigate, on the Mediterranean and Black Sea stations.—Staff Assistant-Surgeon Kellett, of the Kilkenny district, sailed on the 16th instant for service at the seat of war; Mr. Kearns, surgeon of the town, has taken medical charge of the troops in the garrison.—23rd Foot: Henry Thomas Sylvester, M.D., from the staff, to be assistant-surgeon, vice Jenkins, deceased; Assistant-Surgeon Mr. Henry Hunter Raymond from the staff, to be assistant-surgeon, vice Risk, who has resigned.—68th Foot: Assistant-surgeon Alexander Johnston, M.D., from the staff, to be assistant-surgeon.—88th Foot: Assistant-surgeon Richard William Meade from the staff, to be assistant-surgeon, vice Shogeg, deceased.—Surgeon Thos. Somerville (1846) to the *Nankin*, (50,) at Chatham.—Surgeon Frederic Harvey, on the books of the *Fisgard*, flag-ship, at Woolwich, for service in the Royal Naval Coast-guard Volunteers.—Provisional Depot Battalion: Staff Surgeon of the second class, John Hartley Sinclair, M.D., from half-pay, to be surgeon.—Hospital Staff: Surgeon Wm. Parry, from half-pay of the 4th Foot, to be staff surgeon of the second class.—Surgeon John Newton, from half-pay, Ceylon Rifle Regiment, to be staff surgeon of the second class.—Wm. Ferguson, Gent., to be acting assistant-surgeon, vice Sylvester, appointed to the 23rd Foot.—Edward Canny Ryal, Gent., to be acting assistant-surgeon, vice Raymond, appointed to the 23rd Foot.—Wm. Henry Days, Gent., to be acting assistant-surgeon, vice Johnston, appointed to the 68th Foot.—Michael Thos. Griffin, Gent., to be acting assistant-surgeon, vice Meade, appointed to the 88th Foot.—Assistant-surgeon John C. Austin, from the *Victory*, flag-ship, at Portsmouth, to the *Snake*, screw steam despatch gun-boat, at Blackwall, for service in the Black Sea.—Assistant-surgeon Alexander Collins (1854) to the *Nankin*, 50, at Chatham.

HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, SEPTEMBER 23RD.—The deaths from all causes in the three weeks ending September 23rd have been 3413, 2836, and 2504, including the 2050, 1549, and 1284 deaths from cholera.

## Obituary.

On the 19th inst., at his residence, North-side, Bethnal-green, London, CARACTACUS THEOPHILUS LEWIS, M.D., F.R.C.S.L., formerly of 4, Brighton-place, New Kent-road, Borough. The deceased gentleman died from disease of the heart, a complaint to which he had been subject for some years. Mr. Lewis held the appointment of surgeon to the Queen's Own Light Infantry Tower Hamlets Militia, to which he was appointed in 1853. He was also formerly surgeon to the Royal South London Dispensary, and one of the cholera surgeons of the parish of St. Mary, Newington, during the outbreak of 1849. He had contributed various papers to THE LANCET and other medical journals for the last eleven years.

On the 16th inst., at Lambton-terrace, East-green, in the 66th year of his age, EDWARD DIXON, Esq., surgeon, after a long and painful illness.

On the 21st inst., at Boulogne-sur-Mer, WILLIAM TAIT, M.D., for many years surgeon to the Royal Naval Hospital, at Yarmouth.

On the 28th of July, at Bungalow, East Indies, GEORGE NORTHON FOAKER, Esq., surgeon. The deceased was lately attached to the 12th Lancers, and formerly belonged to the 8th Hussars, (K.O.R.I.L.D.) to which he was appointed in December, 1845.

On the 9th inst., after six hours' suffering, of cholera, Mr. JOHN BARNES, medical student of Guy's Hospital. He was a young man of great promise, and his loss is deeply lamented by his family and friends.

## TO CORRESPONDENTS.

**A. B.**—The matriculation examination at the University of London takes place annually, and commences on the first Monday in July. Candidates must have completed their sixteenth year, and furnish the registrar with certificates of the same at least fourteen days before examination. A fee of £2 is paid at matriculation. The examination is conducted by means of printed papers, but the examiners are not precluded from putting *ad hoc* questions. The subjects of examination are, Arithmetic, Algebra, the first book of Euclid, Natural Philosophy, Chemistry, Greek and Latin, (in 1864 the tasks were, Xenophon, Anabasis, book 3rd; and Virgil, Georgics, book 1st,) French or German, English, and the outlines of History and Geography. The examination occupies nine sittings in five days, and on the first day in the next week the names of the successful candidates are announced.

**Inquirer.**—The statement is entirely false. An attempt was made to obtain an injunction against the BRITISH MEDICAL DIRECTORY, and failed. The next volume (1865) will be the most accurate work of the kind that was ever published.

**L. A. E.** (Commercial-road).—Such conduct was perfectly unjustifiable, and only calculated to bring the profession into disrepute. It is to be hoped, for the sake of common decency, that the patient has exaggerated the statement.

ON THE USE OF EMETICS AND MERCURY IN CHOLERA.  
To the Editor of THE LANCET.

SIR,—Having had some experience during the three visitations of cholera, I think it a pity there is not more humility in us, and more charity to our brethren, when, in honest truth, we all put together know as yet so little certain about its treatment. Every man is entitled to draw inferences in proportion as he has seen and observed. To me, then, there appears much fatal mischief to have resulted from the advocacy of one remedy for every stage and every constitution, each extolling his as the specific, or nearly so, and, when found to disappoint others, attributing the failure to want of a proper or fair trial. I need not enumerate any of the remedies that have been recommended by their advocates; suffice it to say, I have seen most of them tried with anything but uniform results in really bad cases. The most uniform, however, is one which, after what I have said, becomes me to recommend with diffidence, and only as experience justifies—namely, emetics, especially in the early stage, and before much lividity has appeared, with mustard cataplasms extensively applied, and followed by mercury. This method has impressed me from its results as by far the best beginning in arresting disease and setting up healthy action promptly and permanently. The rationale of this plan is well known, and I am surprised to find so few medical men pursue it in the present visitation, compared with the former ones. Of course there are auxiliaries not to be omitted, as plenty of cold water, cold beef-tea, &c., which the medical man can best suggest in each particular case.

There is a point worthy of remark for those who have faith in mercury only, and that is, whether much time would not be gained in its action by being preceded by an emetic. Few, I think, who have seen emetics administered but must have observed the oppressive and depressing sickness, as well as the characteristic vomiting of cholera squirt and cramp, arrested by full vomiting artificially produced and encouraged for a little by plenty of tepid water; also the marked arresting of the purging, an object in my mind greatly to be desired, although many just now care little how much serum is lost. In some instances, after the emetic has taken effect, not a single action of the bowels will take place until an aperient may safely be given a day or two after.

I am, Sir, your obedient servant,

Conduit-street, Hanover-square, Sept. 1864.

F. G. JOHNSTON.

**Dr. Verling.**—We are obliged for the communication. Dr. Verling will perceive, on reference, that the announcement has appeared.

**Dr. Vernon** (Cambridge) takes objection to our recommendation of classing all cases of so-called diarrhoea under the name of cholera, and, with other remarks, he says:—

“The prevailing foolish practice of returning cholera deaths as diarrhoea deaths is calculated not only, as you say, to lull the public into a false security if they look at only one side of the question, and deduce their own chances of escape from the weekly number of returned cholera deaths; but is also pretty sure to excite unfounded fears in that section of the public who, looking only at the health reports, see in them the per-centage of deaths in all cases of cholera frightfully increased by the exclusion from the category of cholera of nearly all cases of diarrhoea (so-called) that may have recovered.”

**Mr. John Pierce.**—We have not seen the prescription, and have no confidence in any such wholesale statements.

**Mr. J. Cruikshank**, (Secretary to Marischal College, Aberdeen).—Thanks.

**Mr. S. Knaggs**, (Huddersfield).—There are many points in the communication of our correspondent with which we agree. It is to be hoped that in any changes which may take place in the laws relating to the profession, means will be devised to put a stop to quackery.

**A Country M.B.C.V.S.**—The work will be noticed.

THE ECONOMIC LIFE ASSURANCE SOCIETY.

To the Editor of THE LANCET.

SIR,—Having been applied to by the Economic Life Assurance Society for my opinion of the health of a patient of mine, and filled up and returned the necessary form, I of course expected the usual fee of one guinea to be forwarded to me within a few days from that time. Waiting, however, a fortnight without hearing from the Society, I wrote to ask if they had not forgotten the fee; but instead of receiving it as I expected, I received a letter, saying that it was not the practice of that Society “to pay fees to the medical attendants of candidates for assurance.”

Now, I shall feel greatly obliged by your publishing this, that my professional brethren may be aware, if they are applied to by that Society, what they may expect for their trouble.

I am, Sir, yours obediently,

Harwell, Sept. 1864.

WILLIAM LIGHTFOOT.

**W. H. S.**—We know nothing of the medicine. From the fact of its being patented, it is doubtless a quack nostrum.

**A Young Subscriber.**—Dr. Andrew Smith, Director-General of the Medical Department of the Army.

**Dr. Day** (University of St. Andrew's) is thanked for his obliging communication and the enclosure.

**G. J.**, (Glasgow).—Inquiry should be made of the editor of the *Pharmaceutical Journal*.

OX-GALL IN CHOLERA.

To the Editor of THE LANCET.

SIR,—The communication of Dr. Lewis, of Finsbury, on cholera, in THE LANCET of last week, is, in my humble opinion, the best that has appeared on the subject, being clear, forcible, and to the purpose. It is to be wished that the profession generally would follow his example in preferring practice to theory.

Will you allow me to ask Dr. Lewis, through the medium of your columns, whether he has tried the inspissated ox-gall in small and repeated doses, with a view to its acting as a substitute for the natural bile during the period in which the biliary secretions appear to be suspended?

Your obedient servant,

Isleworth, Sept. 1864.

HORATIO G. DAY.

**Mr. W. Bentall** (Totness) is thanked for his offer.

**Zythum.**—In one case the remedy might have been effectual; in another it would probably be but slightly beneficial.

The Secretary of King's College, Aberdeen, is cordially thanked for the information afforded.

THE WESTMINSTER HOSPITAL.

To the Editor of THE LANCET.

SIR,—I have been employed here as an extra dispenser and general assistant during the cholera epidemic. Being accused of writing the letter which appeared in your last week's columns, relative to the non-allowance of wine, &c., to the dispensers, I beg most emphatically to deny having written, or caused to be written, anything connected with the complaint referred to.

If you will kindly insert this, you will very much oblige me, as it will remove the accusations made against me and others in the dispensary, who were quite ignorant of the affair.

I am, Sir, yours truly,

SAMUEL WALTON FAXON.

Westminster Hospital Dispensary, Sept. 1864.

**A Clergyman.**—In a short time the book will be noticed. Our opinion will be then given on the subject.

SULPHURIC ACID IN CHOLERA.

To the Editor of THE LANCET.

SIR,—In your last number of THE LANCET you state that Mr. Bodington appears to have made good his claim as to having been the first to advocate and write upon the treatment of cholera by sulphuric acid, and you significantly add that you would like to see a copy of his pamphlet. I have felt such a desire to peruse it that I have, amongst other places, searched at the British Museum, but in vain. My great object in addressing you, Sir, is to call the attention of your readers to the fact, that my friend, Mr. Griffith, of Easton-square, communicated several cases treated by sulphuric acid to THE LANCET in 1849, and that Mr. Bodington wrote to THE LANCET in 1863, to say that he was the author of a pamphlet in 1832, advocating the use of sulphuric acid in cholera.

I beg leave now, through the medium of THE LANCET, to request Mr. Bodington to be good enough to give the address of the publisher of his pamphlet. Mr. Griffith, being a surgeon to a large parish, had an excellent opportunity of testing the efficacy of the acid, and I believe I was the first person to whom he communicated the result of his plan of treatment in 1849, and ever since that period I have invariably resorted to the acid in choleraic attacks with the most satisfactory results.

I am, Sir, your obedient servant,

CHARLES EDWARD HATHERLY.

Lupus-street, St. George's-square, Pimlico, Sept. 1864.

**Mr. E. J. Complin**, (Dreadnought).—The “Cases of Cholera treated by Castor Oil,” arrived too late for insertion in this week's LANCET, but shall appear in our next impression.

NEWSPAPER PUFFING.

To the Editor of THE LANCET.

SIR,—I beg to enclose you a letter addressed to the *Chelmsford Chronicle* and *Essex Herald*, by “George Frederick Rowe,” (Dr. Rowe, of Cavendish-square, London, author of a treatise “On Nervous Diseases, Liver and Stomach Complaints,” &c. The opinion of the profession hereabouts is, that it would have been much more creditable to Dr. Rowe to have addressed his communication to THE LANCET or some other medical journal, and give members of the medical profession, and not the public, an opportunity to judge of the merits of his treatment, if it possess any. Why the author has singled out this locality for making known his cures, we don't know, but perhaps he will explain.

It would do the doctor good to give him a gentle hint on the tenor of his letter, which sounds very much like an *advertising puff*, and the profession here think it so.

I am, Sir, your very obedient servant,

Chelmsford, Sept. 1864.

M.R.C.S.

\* \* It is to be regretted that medical practitioners, by such productions as the one above alluded to, should lay themselves open to the just animadversion of their brethren.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. Marshall Hall; Mr. Coulson; Mr. Critchett; Dr. Verling, (Queenstown, county Cork); A Country M.R.C.V.S.; Mr. Horatio G. Day, (Isleworth); A Clergyman; Dr. F. W. Richardson; Mr. C. E. Hatherly; Mr. Walter Chapman; A. B.; X. L.; Dr. Walker; Mr. Pryce Jones; E. A. M. H.; Mr. R. Ribton; Council of Queen's College, Birmingham; A Young Subscriber; W. H. S., (Sheffield); M.R.C.S., (Chelmsford); Dr. Hood, (Bethlem Hospital, with enclosure); Mr. E. J. Complin; C. J.; Dr. M'Cormac, (Belfast); Mr. H. Wilkinson, (Rotherham, with enclosure); Mr. J. Morley, (Blackburn, with enclosure); T. F., (Tavistock); Mr. W. Chapman; Dr. M'Ghie, (Glasgow, with enclosure); Mr. Henry Thompson; Mr. C. J. Roe; L. A. E.; Dr. Vernon; Mr. John Pierce; Zythum; Mr. S. Millard; Mr. S. Knaggs; Mr. S. W. Faxon; Mr. F. G. Johnston; Dr. Vernon; Mr. W. Lightfoot, (Harwell); Mr. J. Cruikshank, (Aberdeen); Dr. Day, (University of St. Andrew's); Inquirer; G. J.; &c. &c.

## Anatomical and Dental Repository,

46, Museum-street, Bloomsbury, London. — JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

## To Dentists.—A first-rate Mechanical

Dentist, of fifteen years' experience in every branch of Dentistry, begs to inform Members of the Profession that he has every convenience for executing Artificial Work (supplying Materials if required) to any extent, in the best manner, on the shortest notice, and moderate terms.—For particulars, address, A.B., 52, Upper George-street, Bryanstone-square.

## Mr. Edwin Osborne, of 24, Savile-

BOW, LONDON, begs to apprise the patrons of the late Firm of Dodge and Osborne, that he is now the Sole Licensee and Maker of PALMER'S PATENT (American) LEGS; and, having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given (if required).

## Elastic Supporting Belts, of the same

beautiful fabric as Pope and Plante's Elastic Stockings for Varicose Veins. Those for ladies' use, before and after accouchement, are ADMIRABLY ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—no pain little attended to in the comparatively clumsy contrivances and fabrics hitherto employed.

Instructions for measurement and prices on application, and the articles sent by post from the manufacturers, POPE and PLANTE, 4, Waterloo-place Pall Mall, London.

## Dissecting and Post-Mortem Instru-

MENTS, New and Second-hand. Surgical Instruments of the best description; A. URE'S New Urethrotomes for Stricture; New Uterine Compress; Newly Improved Possary; Instruments for Army and Navy Surgeons; DARTNELL'S Patent Truss; Trusses for Union Surgeons; Enema Syringes; New Syphon Enema, as supplied to the Army; New Spinal Machine, pronounced the best ever invented—at

PRATT'S, Surgical Instrument Maker, 420, Oxford-street.

TO THE MEDICAL PROFESSION.

## Fr. G. Ernst, Anatomical Machinist

and MANUFACTURER OF SURGICAL INSTRUMENTS, 46, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam ERNST (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchement-belts, &c.

## New Spinal Support.—Fr. G. Ernst,

Lamb's Conduit-street, Foundling Hospital, particularly directs the attention of the Faculty to his newly-invented SPINAL APPARATUS, which has met with universal approval. It possesses advantages not yet obtained in any other form of support; the pelvic portion being self-adjusting, it follows the movements of the body; but at the same time an equal support is yielded to the whole spinal column, whatever position the wearer may assume; the excessive constraint which has constituted one great defect in similar apparatus is thus removed, and muscular development permitted. It is extremely light, can be worn without fear of observation, and is capable of being adjusted to either description of spinal curvature.

To be had only of the Inventor, 46, Lamb's Conduit-street.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1.

FIG. 1.—MR. BOURJEAUD'S NEW SUSPENSORY BANDAGE, as applied to a patient.—Mr. Bourjeaud begs to state that the bag supporting the scrotum is made of a delicate webbing of silk and india-rubber; the bands running round the thighs consist of the most yielding elastic tissue, and will stretch to twice their length; a third band is adapted to the upper part of the bag, the former being intended to be fastened to the flannel waistcoat of the patient. The scrotum is thus kept raised and fixed *in situ*, without distressing the organ in the least, the suspensor allowing of the most varied movements of the body.

FIG. 2.—The same Suspensory Bandage taken off.

FIG. 2.

## Mr. T. H. Wakley's Stricture Instru-

MENTS. Complete Sets of these Instruments may now be had of WEISS & SON, 62, Strand, London.

## Medical Chemistry. — Chemical

PREPARATIONS and APPARATUS for the ANALYSIS of URINE and URINARY DEPOSITS, by the processes described in Dr. GAZZARDI'S treatise on "Urinary Deposits." In a Mahogany Cabinet, 52s. 6d. JOHN J. GRIFFIN, F.C.S., 10, Finsbury-square, London.

## Chemical Apparatus and Prepara-

TIONS for MEDICAL STUDENTS.—Collections in Cabinets at Two, Three, and Five Guineas, containing materials for Elementary or for Analytical Experiments.

JOHN J. GRIFFIN, F.C.S., Chemist, Mineralogist, and Optician, 10, Finsbury-square, London.

## Chemical Laboratory for Medical

MENT.—A portable mahogany CABINET, containing a careful selection of APPARATUS and CHEMICALS, suitable for the examination of suspected POISONS, of impure DRUGS, of BLOOD, URINE, and URINARY DEPOSITS. Prepared for the use of Hospitals, and of Army Surgeons on foreign stations. Size of Cabinet about three cubic feet. Price £12 12s.

JOHN J. GRIFFIN, F.C.S., Chemist and Optician, 10, Finsbury-square, London.

## Orthopædic Mechanism.—

MR. HEATHER BIGG begs to invite the attention of the Faculty to an entirely new principle he has discovered for constructing the various apparatus for deformities of the Feet, Spine, &c. It combines mechanical power with free muscular action; avoids the least chance of abrasion or supuration, (so often resulting from the mechanical appliances hitherto used,) and assists in every respect an increase of development.

MR. H. BIGG will most gladly show any medical gentleman, who may be interested in the perfection of such contrivances, instruments adapted for Talipes Varus, Valgus, Equinus, Spuria, and Calcaneus; also for Latens, Posterior, and Anterior Curvatures of the Spine, &c. &c.

All cumbersome mechanism being dispensed with, the cost is lessened and the weight diminished at least one half.—PATENTED.

29, LICKSTER-SQUARE.

## Meinig's Electro-Generator,

FOR CHOLERA.

TO THE MEDICAL PROFESSION.

Having witnessed personally the greatest benefit, in the first stages of Cholera, derived from the application of weak, continuous currents of Electricity from the spine to the abdomen, by which the warmth and action of the digestive organs is maintained, and the urinary functions stimulated; and feeling confident that in an advanced stage of the disease strong, interrupted Electric Currents passed along the cramped and paralyzed limbs, and along the spinal column, will be found of paramount efficacy in restoring normal circulation, Mr. Meinig earnestly invites the Medical Profession to test and investigate the effects of Electricity in the now prevalent epidemic; and so confident does he feel of the all but marvellous success of his Apparatus in this dreadful disease, that any medical gentleman who desires it may receive Mr. Meinig's warrant, to the effect that he will retake and repay, within one month after the purchase, any Apparatus which, after trial, it might be wished to return.

Prices of the Portable Generator: 5s., 10s. 6d., 15s., 20s., and 30s., according to power. Powerful Pocket Batteries, 23 3s.

103, LEADENHALL-STREET, and 213A, PICCADILLY.

## John Harvey, Nephew and Successor

to the late Mr. ANDREW SPRINGWEILER, No. 2, Duke-street, Smithfield, London, Medicine Chest and Dressing Case Maker. Ship-Medicine Chests according to Act of Parliament. Emigrant Chests, &c., for all Climates.

Chemical and Plate Chests, Toilette, Jewel, Liqueur, and Sample Cases, Writing Desks, Despatch Boxes, &c., &c.

Wholesale and for Exportation.—Warranted to stand any Climate.

J. H., in soliciting of the medical profession and the trade generally a continuance of the liberal patronage enjoyed for so long a period by his late uncle, begs to inform them that the firm of Springweiler and Thompson (which existed in name only) was dissolved nearly two years prior to Mr. Springweiler's death, and that J. H., as successor and executor of the deceased, continues to carry on the business at the premises occupied for so many years by Mr. Springweiler.

**Pale India Ale and Stout, 4s. 6d.**

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.

WOOD & WATSON, 16, Clement's-lane, City.

**Allsopp's Pale Ale.—Medical gentle-**

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hoffmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1882, No. 20, Vol. 1st, upon ALLSOPP & SONS, PALE INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

**Soyer's Aromatic Mustard.—"M.**

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

**To Invalids and those desirous of**

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMOEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

**Cocoa of the finest quality, prepared**

in the best possible manner.—Our PURE GRANULATED COCOA was pronounced by the Analytical Chemists employed by THE LANCET, in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 6d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s., for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

**DOMESTIC ECONOMY****H. Sparrow and Co. beg to announce**

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congon at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Sonchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

**Metcalf and Co.'s New Pattern**

TOOTH-BRUSHES, PENETRATING HAIR-BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130 and 131, Oxford-street, second and third doors west from Holles-street. Metcalfe's Alkaline Tooth Powder, 2s. per box.

**Cholera Prevented! Rettie's Patents.**

SELF-ACTING SEWER AND SINK TRAPS, for Streets and Kitchen Sinks, to prevent all effluvia from Drains, Cesspools, and Urinals. Damp Houses cured at Fourpence per day, giving a dry, warm temperature, for sick or invalids.

PORTABLE CHAMBER CLOSETS, free from all effluvia.

Orders to E. M. and M. Rettie, 7, Brompton-road. (Enclose Stamp.)

N.B.—Beware of imitations on the above Patents.

**Mineral Waters.—W. Best begs to**

inform the Nobility, Gentry, and the Faculty, that he has just received FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seiditz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-de-Cologne, Arquebuzad, and Foreign Mineral Water Depot, 22, Henrietta-street, Cavendish-square.—N.B. Balls and evening parties supplied with Gern and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

**Do you bruise your Oats yet?—New**

Oat-crushers, £2 15s., £4 6s.; Chaff-cutters, £1 7s., £3 7s.; Mangles, £2 10s.; Flour-mills, £4 10s.—WEDLAKE and Co., 118, Fenchurch-street.—One bushel when crushed makes two.

How to Keep a Horse for 9s. a Week; or a Book on Feeding, 1s. 4d.

**The 16s. Trousers reduced to 14s.—**

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

**Overcoats, Capes, &c., at W. Berdoo's,**

98, New Bond-street, and 89, Cornhill, one of the largest stocks in London. Superior garments at reduced charges. Shooting Jackets. Berdoo's well-known Light Overcoat, for all seasons, (price 45s.) Ladies' Cloaks, Mantles, Habits, &c., all made thoroughly impervious to rain, without obstructing free ventilation, and WITHOUT EXTRA CHARGE, (or made to order, at a day's notice.)

TO THE NOBILITY, CLEGGY, AND GENTRY.

**Walker Babb's Two-Guinea Coats,**

One-Guinea Trousers, and Half-Guinea Vests, made from Welsh, Scotch, and Irish Wools, in their pure state. Will stand any wear, and can be worn in any climate. For Fishing and Shooting nothing can equal them. The Black Tweed is well adapted for Clergymen's Riding Trousers. Waterproof Pocket Coats and Capes, Box Coats, Liveries, &c. &c.

DOYLEY'S SCOTCH WOOLLEN WAREHOUSE, 348, Strand, opposite Waterloo-bridge.

**To all who cannot get a Fit; the**

Importance of which requires no elucidation to convince the most sceptical how indispensably necessary it is to health, comfort, and appearance.

R. T. PIGRAM, while wishing to avoid the present system of puffing, adopts this means of making known his SELF-ACTING INDICATOR of the HUMAN FIGURE. An invention can only be estimated by its results: a trial will not only give satisfaction, but will justify in favouring R. T. P. with their recommendation.

R. T. Pigram, Tailor, 51, Lamb's Conduit-street, Foundling Hospital.

**Assistant-Surgeons.—Gentlemen**

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS, 23, WEST STRAND, LONDON.

the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, on application.

**Gas-heating Apparatus.—H. Mather**

begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Griddles, Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 76, GRAY'S INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

**Rice Harris and Son, Islington**

GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT, LOMBARD-STREET, LONDON.—PATENT SANITARY GAS SHADES.—These Shades, manufactured exclusively by RICE HARRIS and SON, on an entirely new principle, effectually destroy the effluvia and smoke, and diminish the heat, which has hitherto made the use of gas so objectionable in dwelling-houses and offices, where cleanliness and freedom from smell are of importance. They are simple and inexpensive, and may be had in a variety of forms adapted to the style of fittings or the taste of the purchaser, at the Works in Birmingham and London.

**Gold Chains and Jewellery.—**

WATHERSTON and BROGDEN beg to caution the Public against the ELECTRO GOLD CHAINS and POLISHED ZINC GOLD so extensively put forth in the present day under the titles of "Pure Gold" and "Fine Gold," and to call attention to the genuine Gold Chains made from their own ingots, and sold by troy weight at its bullion or realizable value, with the workmanship at wholesale manufacturer's prices. The gold guaranteed, and repurchased at the price charged.—the workmanship, according to the simplicity or intricacy of the pattern. An extensive assortment of Jewellery of the first quality, all made at their manufactory, 18 Henrietta-street, Covent-garden, London, established A.D. 1798.

**Royal Cornwall Infirmary.—Notice**

is hereby given, that a RESIDENT HOUSE-SURGEON is required for the Royal Cornwall Infirmary, at a salary of £150 per annum, without board. A Dispenser will be provided to assist in the general business of the Surgery. Applications, accompanied by testimonials, to be addressed to the "Chairman of the Weekly Committee," at the Infirmary, on or before the 14th of October next; and the Election will take place on the 23rd of October, 1884.

The number of Beds is 55.

Truro, September 13th, 1884.

**Matrimonial Institution.—Founded**

1846.—Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 13 postage stamps, by order of the Director, LAURENCE CUYNEBURY, 12, John-street, Adelphi, London.

## House-Pupil.—Dr. Steggall will have

a Vacancy for a RESIDENT PUPIL in October next. Unusual advantages and assistance will be afforded for Study and Improvement.—For terms apply to Dr. S., 2, Southampton-street, Bloomsbury-square, London.

## Guy's Pupils.—A Physician and

Teacher attached to Guy's Hospital receives into his house one or two PUPILS, whose Studies he would superintend. Gentlemen intending to Graduate at the University would be preferred.—For information, apply to the Librarian, at the Hospital.

## King's College, London.—Medical

DEPARTMENT.—LECTURES on LOGIC and on NATURAL PHILOSOPHY, as required by the Army Medical Board, will be given during the ensuing Session. Logic, (£2 3s. for the course), on Monday and Tuesday, at 11½; Natural Philosophy, (£2 3s. for the course), on Wednesday, Thursday, and Friday, at 11½.  
R. W. JALF, D.D., Principal.  
Sept. 22nd, 1854.

## King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1854-5, will Commence on Monday, October 2, 1854.

The following Courses of Lectures will be given:—

Anatomy—Professor Richard Partridge, F.R.S.  
Physiology and General and Morbid Anatomy—Professors W. Bowman, F.R.S., and Lionel S. Beale, M.B.  
Chemistry—Professor W. A. Miller, M.D., F.R.S.  
Principles and Practice of Medicine—Professor George Budd, M.D., F.R.S.  
Principles and Practice of Surgery—Professor William Fergusson, F.R.S.  
Logic and Natural Philosophy, as required by the Army Medical Board.

### KING'S COLLEGE HOSPITAL.

The new Out-patient Department, and a large portion of the new building, will be ready for occupation in October next.

Clinical Lectures are given every week by Dr. Todd and Dr. Budd, and by Professors Partridge and Fergusson.

The Physicians' Assistants and Clinical Clerks, the House-Surgeons and Dressers, are selected by examination from the Students of the College.

LABORATORIES.—There are two Laboratories in the College, fitted up with every convenience for the attainment of Practical Chemistry, and for the prosecution of scientific researches.

Dr. Beale has also a Laboratory adjoining King's College Hospital for the prosecution of Pathological Chemistry, Demonstrations of the Urine, &c.

SCHOLARSHIPS.—Students entering for the next Winter Session will have the exclusive privilege of contending for three Warneford Scholarships of £25 per annum, for three years. The subjects for the examination, which will commence on September 30, are, Divinity, Classics, Mathematics, History, and Modern Languages, equal marks being assigned to each subject. The classical books fixed on by the examiners for this year are the same as those announced for the Matriculation Examination at the University of London.

One Scholarship of £40, tenable for three years; one of £30, and three of £20 each, tenable for two years, will be filled up in April next, the subjects of the examination being exclusively medical.

Full particulars may be obtained from Dr. Guy, Dean of the Department, or upon application to J. W. Cunningham, Esq., Secretary.

June, 1854. R. W. JALF, D.D., Principal.

## St. Mary's Hospital and Medical

SCHOOL.—The WINTER SESSION will Commence on Monday, the 2nd of October, with an Introductory Address by Dr. ALDERSON, F.R.S., at Half-past Two o'clock.

### LECTURES.

Anatomy and Physiology—Mr. Lane and Dr. Handfield Jones.  
Descriptive and Surgical Anatomy—Mr. Haynes Walton and Mr. James Lane.  
Pathological Anatomy—Dr. Markham.  
Chemistry—Dr. Albert J. Bernays.  
Medicine—Dr. Chambers and Dr. Sibson.  
Surgery—Mr. Coulson and Mr. Spencer Smith.  
Clinical Medicine—Dr. Alderson.  
Clinical Surgery—Mr. Ure.

### SUMMER SESSION, 1855, commencing May 1st.

Botany—Dr. J. S. Burdon Sanderson.  
Materia Medica—Dr. Sieveking.  
Practical Chemistry—Dr. Albert J. Bernays.  
Midwifery, &c.—Dr. Tyler Smith and Mr. I. Baker Brown.  
Medical Jurisprudence—Mr. Ansell.  
Military Surgery—Dr. James Bird, F.R.C.S.E.  
Ophthalmic Surgery—Mr. White Cooper.  
Aural Surgery—Mr. Toyne.  
Dental Surgery—Mr. Nasmith.  
Comparative Anatomy—  
Natural Philosophy—Mr. Lindsay Blyth.

HOSPITAL PRACTICE.—The hospital contains upwards of 150 beds, 65 of which are devoted to Medical, and the rest to Surgical cases. This division includes a ward appropriated to the Diseases of Women, and also beds for Ophthalmic and Aural cases. A Maternity Department is attached to the hospital: 218 poor married women were delivered at their own homes during the past year. The In-patients are visited daily by the Physicians and Surgeons at one o'clock. Lectures on Clinical Medicine will be regularly delivered by Dr. Alderson, and on Clinical Surgery, by Mr. Ure; and occasionally by the other Medical Officers in their respective departments. The Out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

There are three Resident Medical Officers, who board in the hospital, and are appointed for eighteen months; two non-resident Medical Officers; a Medical and a Surgical Registrar. Clinical Clerks and Dressers will be selected from the best-qualified Students. All the above offices are open to competition amongst the qualified Perpetual Pupils of the hospital, without extra fee.

Further information may be obtained on application to the Dean of the School, who will also furnish the names of gentlemen in practice in the vicinity of the hospital, willing to receive Pupils to reside with them.

St. Mary's Hospital,  
Aug. 6th, 1854. H. SPENCER SMITH,  
Dean of the School.

## Private Medical Tuition.—

A Physician of a practical and scientific reputation, residing near Russell-square, receives HOUSE-PUPILS, as well as others, whose Medical Education, in all its branches, will be carefully and privately instructed by teachers of great experience and acknowledged ability. As a private Medical School, this establishment offers unequalled facilities for enabling Medical Students to undergo the requisite Medical, Surgical, and Chemical Examinations at the different Boards. The Students may be instructed singly or in classes, as they may prefer.—Apply to THE LANCET Office.

N.B. A Chemical Laboratory on the Premises.

## Kelvedon School, Essex.

Conducted by Mr. W. WISEMAN, M.C.P.

The Studies of Young Gentlemen intended for the Medical Profession are so arranged at this Establishment as to qualify them, on leaving, for passing the Preliminary Examination at the University of London or Apothecaries' Hall.

Terms, from Thirty Guineas to Fifty Guineas per annum, according to the accommodation, &c., required.

## The Royal London Ophthalmic

HOSPITAL, MOORFIELDS. FOUNDED 1804.

Consulting Physician—Dr. Farre. Physician—Dr. F. J. Farre.  
Surgeons—G. W. Mackmurdo, Esq., F.R.S.; J. Dixon, Esq.; G. Critchett, Esq.; W. Bowman, Esq., F.R.S.; A. Poland, Esq.  
Assistant-Surgeon—J. C. Wordsworth, Esq.

During the past year, 10,431 Patients were treated at this Hospital, and 360 Operations performed, 183 being for Cataract. The Patients are seen daily at Nine o'clock, and Operations performed on Fridays at Ten.

Fee for attendance on the Practice for ONE YEAR, or with the consent of the Medical Officers for an unlimited period, £5 5s.; for THREE MONTHS, £3 3s.

## London Hospital Medical College.—

The WINTER SESSION will Commence on Monday, October 2nd, when an Inaugural Address on the opening of the New College will be delivered by Dr. LITTLE, at Three P.M.

Medicine—Dr. Little.  
Surgery—Mr. Curling, F.R.S., and Mr. Critchett.  
Descriptive and Surgical Anatomy—Mr. Adams.  
General Anatomy and Physiology—Dr. Carpenter, F.R.S.  
Practical Anatomy—Mr. N. Ward, Mr. Wordsworth, and Mr. Gowland.  
Chemistry—Dr. Letheby.  
Pathological Histology—Dr. Clark.  
Dental Surgery—Mr. Barrett.

### SUMMER SESSION, 1855, commencing May 1st.

Midwifery—Dr. Ramsbotham.  
Materia Medica—Dr. Davies.  
Forensic Medicine—Dr. Ramsbotham and Dr. Letheby.  
Botany—Mr. Bentley.  
Comparative Anatomy—Mr. Coles.  
Practical Chemistry—Dr. Letheby.

General fee to the Lectures, £50; to the Hospital Practice and Lectures, eighty-four guineas, payable in two instalments of forty-two guineas each, at the commencement of the two first Winter Sessions. Applications by post to be made to the Honorary Secretary.

## St. Thomas's Medical Session.—A

General Introductory Address will be delivered by SAMUEL SOLLY, F.R.S., on Monday, 2nd October, 1854, at Eight o'clock P.M.

Gentlemen have the option of paying £40 for the first year, a similar sum for the second, and £10 for each succeeding year; or £90 at one payment, as Perpetual.

### SCHOLARSHIPS AND PRIZES FOR 1854-55.

A Scholarship of £20 for the best voluntary Classical and Mathematical examination, at the commencement of the Student's Hospital attendance.

Two Scholarships, for first year's men, each of the value of £20. The Two House-Surgeons, the Fifteen Dressers, and the Resident Accoucheur, will be selected according to merit; and provided with Rooms and Commons in the Hospital, free of expense.

The President's Prizes. The first, 10 Guineas. The second, 5 Guineas. Prizes and Certificates of Honour, in each of the different Classes. Mr. Newman Smith's Prize, £5. The Cheselden Medal, and Dr. Boots' Prize, 10 Guineas.

The Treasurer's Prizes. The first, a Gold Medal. The second, 5 Guineas. And Three of 10 Guineas to Clinical Medical Clerks.

### MEDICAL OFFICERS.

Dr. Boots, Consulting Physician; Mr. Green, Consulting Surgeon; Dr. Barker, Dr. J. Risdon Bennett, Dr. Goulden, Mr. South, Mr. Mackmurdo, Mr. Solly, Mr. Le Gros Clark, Mr. Simon, Dr. Peacock, Dr. Bristowe, Dr. Waller, Mr. Whitfield.

A Systematic Course of Clinical Medicine, with Clinical Instruction in the Wards—Dr. Barker. Ophthalmic Surgery, Mr. Mackmurdo; Midwifery, Dr. Waller and Dr. Griffiths.

Medicine—Dr. J. Risdon Bennett.  
Surgery—Mr. South.  
Physiology—Mr. Grainger and Dr. Brinton.  
Descriptive and Surgical Anatomy—Mr. Le Gros Clark and Mr. Rainey.  
Chemistry and Practical Chemistry—Dr. St. Dundas Thomson.  
Midwifery—Dr. Waller.  
Practical Midwifery—Dr. Griffiths.  
Diseases of the Teeth—Mr. E. Saunders.  
General Pathology—Mr. Simon.  
Botany—Dr. Bristowe.  
Comparative Anatomy—Mr. Huxley.  
Materia Medica—Dr. Peacock.  
Forensic Medicine—Dr. Brinton.  
Anatomical Demonstrations—Mr. Rainey, Mr. Barwell, and Mr. Jones.  
Demonstrations in Morbid Anatomy—Dr. Bristowe and Mr. Jones.  
Microscopical Demonstrations—Mr. Rainey.

To enter, or to obtain further information, apply to Mr. WHITFIELD, Medical Secretary, resident at the Hospital.

**A Physician and Lecturer in one of**  
the largest London Hospitals, residing near Grosvenor-square, can  
receive a PUPIL into his house.—Address to Y. Z., care of Mr. Remshaw,  
384, Strand.

**Mr. G. Hind, F.R.C.S., resumed his**  
DEMONSTRATIONS on the morning of the 15th of September, at  
the usual hour.  
Class-room, 29, Newman-street, Oxford-street. Private residence, 2, South-  
crescent, Bedford-square.

**Medical Education.—An F.R.C.S.,**  
a Teacher in one of the largest Metropolitan Medical Colleges, has a  
few Vacancies for RESIDENT PUPILS. They will have a comfortable and  
convenient home in a central part of London, and careful assistance in their  
studies. Fee moderate. Apply for further particulars to the Rev. A. B.,  
Museum-house, Grosvenor-street.

**A Physician attached to a Public**  
Institution, (centrally situated at the West-end of London,) has a  
Vacancy in his Establishment for a Gentleman about to commence his  
Hospital Attendance during the ensuing Session, whom he would be happy to  
assist in the direction of his Studies.—For terms and address, direct to M.D.,  
Mr. Nash's, Chemist and Druggist, Marylebone-street, Cavendish-square.

**University College, London.—**  
FACULTY OF MEDICINE. The Session will commence on Monday,  
October 2nd, when Professor CARPENTER, M.D., will deliver an Introductory  
Lecture, at Three o'clock.  
Hospital Practice daily throughout the year, with Clinical Lectures by the  
Physicians and Surgeons; also, Lectures on Ophthalmic Cases, and Instruction  
in the Application of Manages and other Surgical Apparatus.  
Prospectuses may be obtained at the office of the College.  
G. VIVIAN BELLIS, Dean of the Faculty.  
CHAS. C. ATKINSON, Secretary to the Council.

Sept. 25th, 1854.

**Westminster Hospital Medical**  
SCHOOL.—The WINTER SESSION will commence on Monday,  
October 2nd, 1854, with an Introductory Address by Mr. BARNARD HOAR, at  
Seven o'clock P.M.

The Hospital affords relief to about 2000 In-patients, and 14000 Out-patients  
annually.  
The School premises have been greatly improved since the last Session, and  
considerable additions have been made to the Museums of Anatomy and  
Materia Medica.

Fee for attendance on all the Lectures and Hospital Practice required by the  
College of Surgeons and Society of Apothecaries, £71 8s. This sum may be  
paid at once, or by instalments of £20 at the commencement of the first  
Session; £20 at the commencement of the second Session, and the remainder  
at the commencement of the third Session.

Some of the Lecturers, and other Gentlemen in the neighbourhood of the  
Hospital, receive Students to reside with them.

Further information may be obtained from Mr. Holthouse, 9, New Burling-  
ton-street, from any of the other Lecturers, or from  
F. J. WILSON, Secretary to the Hospital.

**Charing-cross Hospital Medical**  
SCHOOL, WEST STRAND, LONDON.

WINTER SESSION, October, 1854, to March, 1855.

Chemistry—H. H. Lewis, A.M.  
Anatomy—Mr. E. Canton.  
Demonstrations and Dissections—Mr. Goldsbro.  
Surgery—Mr. Hancock.  
Physiology and Pathology—Dr. Hyde Salter.  
Medicine—Dr. Chowne and Dr. Rowland.

SUMMER SESSION, May, 1855, to the end of July.

Practical Chemistry in the Laboratory—H. Lewis, A.M.  
Materia Medica—Dr. Steggall and Dr. Willshire.  
Botany—F. W. Headland, B.A.  
Midwifery, &c.—Dr. Chowne and Mr. Hird.  
Medical Jurisprudence—Dr. G. Birckett and Mr. Hird.

All the Lectures required by the College of Surgeons and Society of  
Apothecaries, £45, without Practical Chemistry, which is £2 2s.

HOSPITAL PRACTICE.

Consulting-Physician—W. Shearman, M.D.  
Physicians—Dr. Golding and Dr. Chowne.  
Assistant-Physician—Dr. Rowland.  
Surgeons—Mr. Hancock and Mr. Avery.  
Assistant-Surgeon—Mr. E. Canton.

MEDICAL PRACTICE.—Full period required, £15 lbs. Surgical, £15 lbs.  
Both Medical and Surgical, £26 6s.

JOHN ROBERTSON, Hon. Sec.

**Dr. John Struthers will deliver his**  
LECTURES on ANATOMY during the ensuing Session at SURGEONS'  
HALL.

Lectures at One P.M.; Demonstrations at Four P.M.: Practical Anatomy,  
from Nine A.M. till Four P.M.  
Edinburgh, September, 1854.

Recently published,

**Anatomical and Physiological**  
OBSERVATIONS. By JOHN STRUTHERS, M.D., F.R.C.S., Lecturer  
on Anatomy, Edinburgh. With Woodcuts. 8vo, price 3s.  
Edinburgh: Sutherland and Knox. London: Simpkin, Marshall, and Co.

**The Queen's University in Ireland.—**  
QUEEN'S COLLEGE, BELFAST.

FACULTY OF MEDICINE. SESSION 1854-5.—The Lectures will commence  
on Wednesday, November 1st.  
The Matriculation Examination will take place on Friday, October 26th, and  
also on November 8th, and on November 24th, for those who may not have  
matriculated previously.

The Scholarship Examination will commence on October 20th.  
Six Junior Scholarships, of £20 each, and two Senior Scholarships of £30  
each, are appropriated to Medical Students.  
Junior Scholars are exempted from one-half of their class fees.  
The College Fees are reduced from £23 to 10s. for the first year, and from  
£2 to 6s. for subsequent years, in consequence of an additional grant to the  
College from Parliament.

(Signed) By Order of the President,

Queen's College, Belfast, Sept. 18th, 1854.

RD. OTTIFOR, Clerk,  
Registrar.

**Queen's College, Cork.**  
SESSIONS 1854-1855.

MATRICULATION AND SCHOLARSHIP EXAMINATIONS.

On Tuesday, the 17th of October next, at Ten o'clock A.M., an Examination  
will be held for the Matriculation of Students in the Faculties of Arts,  
Medicine, and Law, and in the Departments of Civil Engineering and  
Agriculture.

The Examinations for Scholarships will commence on Tuesday, 17th October.  
The Council have the power of conferring at these Examinations Ten Senior  
Scholarships of the value of £40 each—viz., Seven in the Faculty of Arts, Two  
in the Faculty of Medicine, and One in the Faculty of Law; and Forty-five  
Junior Scholarships—viz., Fifteen in Literature, and Fifteen in Science, of  
the value of £24 each; Six in Medicine, Three in Law, and Two in Civil  
Engineering, of the value of £20 each; and Four in Agriculture, of the value  
of £15 each.

Prospectuses, containing full information as to the subjects of the Examina-  
tions, &c., may be had on application to the Registrar.

By order of the President,

Sept. 8th, 1854.

ROBT. J. KERRY, Registrar.

of 280 beds.

Fee, £5 5s., to be paid in one, or in separate payments of £2 2s. at the com-  
mencement of each Session.

The Courses at this University qualify for Examination at the several  
Universities, Colleges of Surgeons, and Boards of the Public Services, and at  
Apothecaries' Hall.

Graduates who have attended the several Medical Classes in this University  
are charged no Graduation Fees.

The Examination Term will be held in the third week of October.

For particulars, in the case both of students and practitioners, application  
may be made to the Secretary of the University.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS,

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.

Office hours from 12 till 4.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,**

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendances from 11 till 4.

MEDICAL.

**Required, by a General Practitioner,**  
an ASSISTANT, to Dispense, Visit, and attend Midwifery.—Apply, personally, to Mr. Walter Chapman, Surgeon, Lower Tooting, Surrey.

**Wanted, by a General Practitioner,**  
an ASSISTANT, to Dispense, occasionally Visit, and attend Midwifery.—Apply, by letter, to A. G., Post-office, St. Helen's, Lancashire, stating age, qualifications, and salary required.

**A Dispensing Assistant.—Required,**  
by a General Practitioner in the neighbourhood of London, an ASSISTANT to Dispense Medicines.—Apply to G. Whiteman's News Office, Little Chelsea.

MEDICAL.

**Wanted, by a Young Man who has**  
served three years of his apprenticeship, a Situation as ASSISTANT to a Medical Man, in town or country.—Address, Gals Baker, Ward, and Oldfield, Wholesale Chemists, Bowdrie-street, Fleet-street, London.

**Wanted to Purchase, by an M.D.**  
Edin., M.R.C.S.L., unmarried, aged twenty-six, who has had eight years' experience, and possesses first-class testimonials, a PARTNERSHIP in a good General Practice, where the Proprietor is in want of active assistance.—Address, A.B., Post-office, Birmingham, Notts.

**A Gentleman wishes for a situation**  
as Dispensing and occasional Visiting ASSISTANT. He is a neat dispenser and dresser, and can perform all the minor operations in surgery. Satisfactory references can be given.—Address, J. F., Post-office, Tavistock, Devon.

**A Surgeon, living in a County**  
Town, not far from London, is in want of a Qualified ASSISTANT, to Visit and Dispense. The duties are light, and the Situation comfortable. A Dissenter would be preferred.—Apply to Mr. Pratt, 420, Oxford-street, London, stating age, qualification, and salary expected.

**Wanted by a Second-year's Student**  
(aged Twenty-four), at one of the Borough Hospitals, fully competent to Visit, Dispense, and attend Midwifery, BOARD and LODGING with some Medical Man who would consider his services, when not attending Lectures, an equivalent. Unexceptionable references can be given.—Address, W. F., 2, Charlotte-row, Walworth-road.

TO PARENTS AND GUARDIANS.

**A Medical Gentleman in good Prac-**  
tice has Vacancies for Two or Three STUDENTS. His House is healthily situated, within an easy distance of the principal Hospitals. Terms moderate. References given and required.—Address, prepaid, to F.R.C.S., care of Mr. Joyce, Stationer, St. John-street-road, London.

**Medical Assistant. — A Married**

Gentleman, aged twenty-seven, offers his services as Visiting and Dispensing Assistant to a General Practitioner, in Town or Country. The Advertiser, having had great experience in Midwifery and General Country Work, would not object to carry on a Branch Practice. Testimonials of the highest character can be produced.—Apply by letter, pre-paid, to Alpha, care of Mrs. Prestige, Stationer, 54, Scott's-place, Lower-road, Islington.

MEDICAL.

**An L.A.C., aged 27, wishes a situa-**  
tion as Visiting and Dispensing ASSISTANT with a medical Practitioner, residing within half an hour's walk of the London Hospital. He would require a short time in the day to attend hospital practice.—Address, L.A.C., News-rooms, 68, Cheapside.

**To Let, Furnished, a Sitting-Room,**  
with one or two Bedrooms, within three minutes' walk of St. Bartholomew's Hospital. The House is quietly situated, and very airy.—Apply at 2, Bartholomew-close.

**Medical Transfer and Partnership.**

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RELINQUISH, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

**Partnership.—A Practitioner in the**

City is desirous of meeting with a Gentleman with whom he can arrange for a present PARTNERSHIP, with the view of ultimate Retirement. The command of £200 will be essential.—Apply to R. A., care of Mr. Orridge, 30, Bucklersbury.

**Partnership.—A Practitioner in the**

North-western Suburb of the Metropolis, (with a rapidly-increasing Practice) wishes for a PARTNER. Entrance, about £200.—Apply to M.R.C.S., care of Mr. Orridge, 30, Bucklersbury.

TO SURGEONS AND CHEMISTS.

**For Disposal, a Business in one of**  
the most progressive suburbs in London, well adapted for a Surgeon who understands Retail, or a Druggist capable of Prescribing. No competition, and rent and taxes moderate.—Apply for particulars, W. T., Messrs. Hodgkinson, Tonge, and Stead, 213, Upper Thames-street.

**Practice and Dwelling-House for**

SALE. A Gentleman, residing in the vicinity of one of the Metropolitan Hospitals, is desirous of immediately disposing of his PRACTICE, with or without the House. It has an Open Surgery, long established, in a leading thoroughfare, and densely-populated locality. Terms moderate.—Address A., Mr. Goldstone, Guy's Hospital.

MEDICAL.

**For Disposal, a well-established**

GENERAL PRACTICE, in a small railway town, situate in the south of Yorkshire. Such an opportunity seldom offers for the safe transfer of £250 to £400 per annum.—Address, A. Z., Messrs. Butterfield and Clark, Wholesale Druggists, York.

**A Gentleman with the double quali-**

fication, and who has had considerable opportunities of obtaining a practical knowledge of the duties of his profession, is desirous of meeting with a situation as Visiting ASSISTANT to a gentleman in extensive and respectable Practice in town or country.—Address, X. L., Mr. Baines', Chemist, Waterworks-street, Hull.

**A Surgeon required to proceed to**

AUSTRALIA, and remain there or return. A Gentleman is also required to proceed to New York and return.—Apply to Hall and Co., 34, Terrace, Trinity-square, Tower-hill.

**To Surgeons about proceeding to**

THE COLONIES.—A very favourable opportunity of Passage is offered to a respectable Medical Gentleman, by a splendid first-class Ship, to sail for Port Phillip the middle of October.—Apply to John Bonus and Son, 81, Gracechurch-street.

**In an Establishment three miles**

west of London, YOUNG LADIES are RECEIVED to BOARD and EDUCATE, at 30, 35, and 40 guineas per annum, inclusive terms. A garden of nearly two acres in extent.—For prospectuses, address M. X., Barker's Library, Dorcas-terrace, Hammersmith.

**Insanity and Nervousness.—In a**

small Establishment, conducted by a Lady, two or three PATIENTS can be RECEIVED on very moderate terms. Every possible care, attention, and kindness is observed, and the fullest confidence may be placed in the advertiser. References of the first respectability will be offered.—Apply by letter, or personally, to Miss Lush, York House, Battersea, Surrey.

**To be disposed of, in consequence of**

the continued indisposition of the proprietor, Mr. Elijah Pring, the Good-will, Stock, Fixtures, &c., of that well-known establishment, the MEDICAL HALL, No. 30, Westmoreland-street, Dublin, (established in 1821,) now in full working order, and to which a highly respectable and numerous connexion is attached. The business, until disposed of, will be carried on as usual. The fullest information can be had of Messrs. Harring and Co., 40, Aldersgate-street, London; of Mr. Graham, No. 13, Cope-street, Dublin; and of Messrs. Grattan and Co., Belfast; or at the premises.—16th September, 1864.

TO MEDICAL STUDENTS AND OTHERS.

**Appartments furnished, with attend-**

ance, in the house of a professional gentleman, in a central and agreeable part of London, close to the British Museum, and less than half-a-mile from the Middlesex University College, Charing-cross, and King's College Hospitals. Terms average £1 per floor weekly; single rooms, 10s.—Address, 13, Caroline-street, Bedford-square.

LONDON, 2ND OCTOBER, 1854.

# MR. CHURCHILL'S LITERARY ANNOUNCEMENTS

FOR THE

## PRESENT PUBLISHING SESSION.

### I. A Manual of Pathological Anatomy.

Illustrated with numerous Engravings on Wood. By C. HANDFIELD JONES, M.B., F.R.S., Assistant-Physician to St. Mary's Hospital; and EDWARD H. SIEVEKING, M.D., Assistant-Physician to St. Mary's Hospital. Foolscap 8vo. [Ready First Week in October.]

\*.\* Mr. Churchill is happy to announce this additional volume to his Manuals, and believes it will be found fully to sustain the high reputation which the Series has attained.

### II. Principles of Comparative Physiology.

Illustrated with numerous Engravings on Wood. By W. B. CARPENTER, M.D., F.R.S. The Fourth Edition. 8vo. [Ready First Week in October.]

\*.\* "The whole work has been most carefully revised, and the Author ventures to think that the present Edition more completely represents the state of the Science at the period of its publication than any of its predecessors have done. He can honestly say, that he has spared no time or labour in its preparation which it has been in his power to bestow."—EXTRACT FROM PREFACE.

### III. Medical Anatomy. Illustrated in a

Series of Coloured Plates from original Drawings, with Practical Commentaries. By FRANCIS SIBSON, M.D., F.R.S., Physician to St. Mary's Hospital. Fasciculus I. Imperial folio. [Ready 1st January, 1855.]

\*.\* The delay in the appearance of this work has arisen from the desire of the Author to avail himself of the best subjects to illustrate the Normal and Abnormal Condition of the Viscera; and also that such progress should be made with the Drawings as to ensure regularity of publication.

The work will be issued in the same form, and at the same price, as Mr. Macleise's Surgical Anatomy.

### IV. Clinical Lectures on Certain Diseases

OF THE URINARY ORGANS, AND ON DROPSIES. By R. B. TODD, M.D., F.R.S., Physician to King's College Hospital. Foolscap 8vo. [In the Press.]

\*.\* This will form a second volume of Dr. Todd's Clinical Lectures. The first volume, "On Paralysis and Diseases of the Brain," was issued in the spring of this year, and has been most favourably received by the Profession.

### V. What to Observe at the Bedside and

AFTER DEATH. Published by authority of the London Medical Society of Observation. The Second Edition. Foolscap 8vo. [Ready in October.]

### VI. On Diseases of the Joints. By

WILLIAM COULSON, Surgeon to St. Mary's Hospital, &c. 8vo. [In the Press.]

### VII. The Book of Prescriptions: contain-

ing 2800 Prescriptions, collected from the Practice of the most eminent Physicians and Surgeons, English and Foreign. By HENRY BEARLEY. 24mo. [Now ready.]

### VIII. On the Inhalation of Chloroform and

OTHER MEDICINES FOR THE PREVENTION OF PAIN AND THE RELIEF OF DISEASE. By JOHN SNOW, M.D. 8vo. [In the Press.]

### IX. Instruction in Chemical Analysis.

By C. REMIGIUS FRESENIUS. Edited by LLOYD BULLOCK. Quantitative. Second Edition. 8vo. [Ready Second Week in October.]

### X. The Use of the Blowpipe in the Ex-

AMINATION OF MINERALS, ORES, AND OTHER METALLIC COMBINATIONS. By Professors PLATTNER and MUSPRATT. Illustrated by numerous Engravings on Wood. Third Edition. 8vo. [Just Ready.]

\*.\* This Edition has been most carefully revised by Professor Muspratt, and received from him considerable additions.

### XI. Principles of Medicine; compre-

hending General Pathology and Therapeutics. By C. J. B. WILLIAMS, M.D., F.R.S. Third Edition. 8vo. [In the Press.]

### XII. On the Physical Diagnosis of the

DISEASES OF THE LUNGS AND HEART. By HERBERT DAVIES, M.D., Senior Physician to the Royal Infirmary for Diseases of the Chest. Second Edition, revised and enlarged. Post 8vo. [Now Ready.]

### XIII. On the Topical Medication of the

LARYNX IN CERTAIN DISEASES OF THE RESPIRATORY AND VOCAL ORGANS. By EBEN. WATSON, A.M., M.D., Fellow of the Faculty of Physicians and Surgeons of Glasgow. 8vo. [In the Press.]

### XIV. A Manual of Tropical Medicine and

HYGIENE; or, the Influence of Hot Climates on European Constitutions, and of European Climates on Tropical Invalids. By JAMES BIRD, M.D., F.R.C.S., late Physician-General to the Army, Bombay. 8vo. [Ready in January.]

### XV. A Disquisition on Certain Parts and

PROPERTIES OF THE BLOOD. With Illustrative Woodcuts. By DAVID TOD, M.R.C.S. 8vo. [Ready in November.]

### XVI. On the Development and Design of

CERTAIN PORTIONS OF THE CRANIUM. Illustrated with Plates in Lithography. By JOHN HILTON, F.R.S., Surgeon to Guy's Hospital. 8vo. [Just Ready.]

### XVII. A Practical Treatise on Diseases of

THE TESTIS, SPERMATIC CORD, AND SCROTUM. By T. BLIZARD CURLING, F.R.S., Surgeon to the London Hospital. Second Edition, with Additions. 8vo. [In the Press.]

### XVIII. On the Action of Medicines. By

FRED. WM. HEADLAND, B.A. Lond., F.L.S., M.R.C.S. Second Edition, with Additions. 8vo. [In the Press.]

### XIX. Surgical Anatomy. By Joseph

MACLEISE, F.R.C.S. The singular success of this Work exhausted the First Edition of 1000 Copies within six months of its completion.

THE SECOND EDITION, with entirely new Plates, now in the course of publication. Fasciculi I. to V. Imperial Folio, 6s. each. Fasciculus VI. [Ready First of October.]

### XX. Practical Treatise on the Diseases of

CHILDREN AND INFANTS AT THE BREAST. Translated from the French of M. BOUCHUT, with Notes and Additions. By P. HINCKES BIRD, F.R.C.S. 8vo. [Ready in November.]

### XXI. A Discourse on Medical Botany.

By The Right Honourable The EARL STANHOPE. 8vo. [Now Ready.]

### XXII. Pathology and Treatment of Leu-

CORRHEA. Illustrated with Engravings. By W. TYLER SMITH, M.D., Physician-Accoucheur to St. Mary's Hospital. 8vo. [Nearly Ready.]

### XXIII. The Microscope and its Revelations.

With numerous Engravings on Steel and Wood. By W. B. CARPENTER, M.D., F.R.S. Fcap. 8vo.

\*.\* Considerable time has been required for the careful execution of the Engravings necessary for the illustrations of this comprehensive Work. Mr. Churchill is now enabled to announce its publication [Early next Year.]

LONDON: JOHN CHURCHILL, NEW BURLINGTON STREET.

PRINTED by THOMAS CHOWAT SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CHURCHILL, of No. 423, Strand, in the parish of St. Martin-in-the-Fields, Westminster, in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—Saturday, September 30, 1854.

**TURNER'S CHEMISTRY.** Eighth Edition. One vol.  
8vo, 21 10s.  
London: WALTON and MABERY, Booksellers and Publishers to Uni-  
versity College, 28, Upper Gower-street, and 27, Ivy-lane.

Now ready at all the Libraries, in Three Vols.,  
**A Physician's Tale.**  
By HEBERDEN MILFORD.  
Hurst and Blackett, Publishers, Successors to Henry Colburn,  
13, Great Marlborough-street.

Second Edition, in 2 vols., with Portrait, 21s.  
**Memoirs of John Abernethy, F.R.S.,**  
with a View of his WRITINGS, LECTURES, and CHARACTER.  
By GEORGE MACILWAIN, F.R.C.S.  
"We hope these volumes will be perused by all our readers. They are ex-  
tremely interesting, and not only give an account of Abernethy, which cannot  
fail to be read with benefit, but they discuss incidentally many questions of  
medicine and medical policy. Mr. Macilwain is fond of anecdotes, and has  
inserted a great number; this does not render his work less pleasant reading.  
We recommend it most strongly as an interesting, and, at the same time, in-  
structive treatise."—MEDICO-CHIRURGICAL REVIEW.  
Hurst and Blackett, Publishers, Successors to Henry Colburn, 13, Great  
Marlborough-street.

**The Diseases of the Breast, and**  
THEIR TREATMENT. By JOHN BIRKETT, F.R.C.S.E., F.L.S.,  
Surgeon to Guy's Hospital. 8vo, with Coloured Plates, price 12s. 6d. cloth.  
London: Longman, Brown, Green, and Longmans.

**The Edinburgh Review, No. CCIV.,**  
will be published on Friday next.

- CONTENTS.
- I. Vestries and Church-rates.
  - II. Memoirs of King Joseph.
  - III. The Arab Tribes of the Great Desert.
  - IV. Railway Morals and Railway Policy.
  - V. Burton's History of Scotland, from 1699 to 1746.
  - VI. Macaulay's Speeches.
  - VII. Reform of the War Departments.
  - VIII. The Management and Disposal of our Criminal Population.
- London: Longman and Co. Edinburgh: A. and C. Black.

**The Edinburgh Medical and Surgical**  
JOURNAL,  
NEW SERIES. No. IV. OCTOBER, 1864.

- CONTENTS.
- PART I.—ORIGINAL COMMUNICATIONS.
1. Cases of Aneurism.
  2. Experiments on the Communicability of Cholera to the Lower Animals.
  3. On the Immediate Cause of Sleep.

price 12s. 6d. each.

London: John Churchill, New Burlington-street; Macintosh and Stewart  
Edinburgh; and Fennell and Co., Dublin.

# THE BRITISH MEDICAL DIRECTORY FOR 1855.

The Editors respectfully and gratefully acknowledge the receipt of a large number of "Returns" for this Directory.

The Editors have stated on previous occasions, that when the entries in the Directory for the current year (1854) are found to be correct, a mere intimation of that fact will be sufficient; but when alterations are required, they should be distinctly specified, and in all cases the Names should be written *clearly*, and at *full length*.

Lists of the Names of duly-qualified Practitioners resident in the several Cities, Towns, and Villages of the United Kingdom, will be thankfully received, as also information of the Death, Removal, or Appointment to a Public Office, of any duly-qualified Practitioner. In the Metropolis, and other Cities and large Towns, the *streets and numbers* of the Houses should be given.

Duly-qualified Practitioners who have already responded to these appeals would confer a favour on the Editors by inducing Professional friends and neighbours to make their "Returns" as quickly as possible, as delays might evidently cause some names to be omitted.

"The BRITISH MEDICAL DIRECTORY, for ENGLAND, WALES and SCOTLAND," to be published on the 1st of January, 1855, may be obtained of all Booksellers and Newsmen, price Six Shillings, (including One Shilling postage.)

OFFICE, 423, STRAND.

Just published, 8vo, cloth,

**Practical Observations on Conical CORNEA.** By J. NOTTINGHAM, M.D., F.R.C.S., Surgeon to the St. Anne's Eye and Ear Institution, Liverpool.

London: John Churchill, New Burlington-street.  
Liverpool: Deighton and Laughton.

Just published, post 8vo, cloth, 8s. 6d.

**Change of Climate as a Remedy in VARIOUS CHRONIC DISEASES.** By D. J. T. FRANCIS, M.D.

"Proceeds from the pen of a well-informed practitioner and an accomplished gentleman, well acquainted with the subject upon which he treats."—THE LANCET.

"A very meritorious production."—MEDICAL TIMES AND GAZETTE.  
London: John Churchill, New Burlington-street.

**Pharmacopœia.—A New Translation** of the last LONDON; to which is added the DOSES and PROPERTIES of MEDICINES, with the LATIN NAMES, &c. 12mo, cloth, 1s.

Reeves and Turner, 114, Chancery-lane.

Now ready, price 6s. 6d., or free, by post, to any part of the United Kingdom, price 8s., Fourth Edition, greatly enlarged and improved,

**A Grammatical Introduction to the LONDON PHARMACOPEIA, and a KEY to PHYSICIANS' PRESCRIPTIONS.** By S. F. LEACH.

"This little work will be found extremely useful to students who have received but an imperfect classical education."—THE LANCET.  
Hughes and Butler, Medical Booksellers and Publishers, 15, St. Martin's-le-Grand.

**Allen's Illustrated Catalogue, containing size, price, and description of upwards of 100 articles, consisting of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes, Writing-desks, Dressing-cases, and other travelling requisites, forwarded on receipt of two stamps.**

ALLEN'S TRAVELLING-BAG (patented) has the opening as large as the bag itself, and therefore possesses an immense advantage over all others.

ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK, and their New Quadruple Portmanteau (containing four compartments), are the best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Barrack-room Furniture, and Military Outfitters, (see separate Catalogue,) 18 & 22, WEST STRAND.

**The Pen Superseded.**

The most elegant, easy, economical, and best method of MARKING LINEN, Silk, Books, &c., without the ink spreading or fading, is with the INCORRODIBLE ARGENTINE PLATES. No Preparation required. Any person can use them with the greatest facility. Name-plate, any style, 2s. 6d.; Initials, ditto, 1s. 6d.; Numbers, per set, 3s. 6d.; Crest, 6s. Sent, post free, with directions, on receipt of stamps or post order.

FREDK. WHITEMAN, Inventor and Sole Maker, 19, Little Queen-street, Holborn.

On India paper, price 7s. 6d.

**A Portrait of R. D. Grainger, Esq.,** F.R.S., Lecturer on Physiology, St. Thomas's Hospital, &c. &c. Drawn on Stone by J. H. LYNCH, from the Original Picture by G. F. TENISWOOD.

London: S. Highley, Fleet-street.

**Mayall's Daguerreotype Portrait** GALLERIES, 224, Regent-street, (corner of Argyle-place,) and 433, West Strand.

Mr. Mayall begs to invite inspection of his extensive collection of DAGUERRETYPE PORTRAITS of EMINENT MEDICAL, SCIENTIFIC, and LITERARY MEN, Panoramas from Nature, and Views of the late Exhibition; together with specimens of every improvement in the art. The originals of THE LANCET PORTRAITS on view.

**H. Silverlock's Medical Label Ware-** house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

**Metcalf and Co.'s New Pattern**

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair.—At METCALFE, BINGLEY, and CO.'s only establishment, 130a and 131, Oxford-street, second and third doors west from Holles-street. Metcalf's Alkaline Tooth Powder, 2s. per box.

**Rice Harris and Son, Islington**

GLASS WORKS, BIRMINGHAM, and No. 1, THREE KING-COURT, LOMBARD-STREET, LONDON.—PATENT SANITARY GAS SHADES.—These Shades, manufactured exclusively by RICE HARRIS and SON, on an entirely new principle, effectually destroy the effluvia and smoke, and diminish the heat, which has hitherto made the use of gas so objectionable in dwelling-houses and offices, where cleanliness and freedom from smell are of importance. They are simple and inexpensive, and may be had in a variety of forms adapted to the style of fittings or the taste of the purchaser, at the Works in Birmingham and London.

**New Spinal Support.—Mr. H. Bigg,**

29, Leicester-square, particularly invites the attention of the Faculty to his newly invented SPINAL APPARATUS, which is constructed on a principle never before employed. It entirely dispenses with cumbersome mechanism, and having a force analogous to muscular motion, allows the body to move freely in every direction. When applied its action resembles the pressure of the hands against the curvature, accompanied by a gentle uplifting of the drooping side. It is remarkably light; has a self-adjusting pelvic part; can be applied to every variety of spinal deformity; and arranges itself so perfectly as to escape the closest observation. Patented.

To be had only of the Patentee, 29, Leicester-square.

## Family Endowment Life Assurance AND ANNUITY SOCIETY.

13, CHATHAM PLACE, BLACKFRIARS, LONDON.

ESTABLISHED 1835.

CAPITAL, £200,000.

Robert Bruce Chichester, Esq.

Major Henderson.

Charles Henry Latouche, Esq.

Edward Lee, Esq.

Colonel Ouseley.

Major Turner.

Joshua Walker, Esq.

An Annual Bonus is allowed to parties who have made Five Annual Payments on Policies taken out on the Profit Scale. That for the current year is 20 per cent. in reduction of the Premium.

ENDOWMENTS AND ANNUITIES GRANTED AS USUAL.

INDIA BRANCH.

The extensive Assurance Business of the Agra and United Service Bank has been transferred to this Office, and the Society has Branch Establishments or Agencies at Calcutta, Madras, Bombay, Agra, and Hong Kong.

JOHN CAZENOVE, Secretary.

## Mineral Waters.—W. Best begs to

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Selditz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-de-Cologne, Arquebuzard, and Foreign Mineral Water Depot, 22a, Henrietta-street, Cavendish-square.—N.B. Halls and evening parties supplied with German and Struve's Artificial Seltzer Water on advantageous terms.

N.B. Allsopp's and Bass's Pale Ale, and Guinness's Dublin Stout.

GREAT REDUCTION IN PRICE OF

## Sir William Burnett's Disinfecting

FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d. This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street, London-bridge.—N.B. Beware of a spurious imitation.

## The Cholera Prevented by the

destruction of all noxious effluvia.

CREW'S DISINFECTING FLUID. Recommended by the College of Physicians and the London Board of Health. The cheapest and strongest CHLORIDE OF ZINC.

Quarts, 2s. Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED  
FURTHER GREAT REDUCTION IN PRICE.

## Crews's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion.

The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crews's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in Imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 5s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

## Dissolution of Partnership.

66, Farringdon-market, London, 30th Sept., 1854.

SIR,—We beg leave to inform you that the Firm of Potter and Hailey has this day been dissolved by mutual consent, and the Business of this Establishment will in future be carried on by Mr. Potter, who is charged with the liquidation of all claims upon the Firm, and the collection of Debts owing to the same.

In making this announcement, allow us to express our grateful acknowledgments for the very liberal patronage with which we have been honoured, and to subscribe ourselves,

Your obliged obedient Servants,

HENRY POTTER,

GEORGE HAILEY.

SIR,—With reference to the above, permit me to observe, that in conducting this Business on my own account, it shall be my constant study to merit a continuance of that confidence and support so liberally awarded to the late firm and my deceased Uncle, during a period of more than forty years.

Again soliciting your patronage, and assuring you that all your Orders shall be executed with promptitude, and at moderate charges, I beg to subscribe myself

Your obliged obedient Servant,

HENRY POTTER.

HENRY POTTER, (late Potter and Hailey,) Importer of Leeches, Dealer in Turkey Sponge, Herbalist, &c., 66, Farringdon-market.

Price Lists sent by post on application.

## Engineers' Masonic and Universal MUTUAL LIFE ASSURANCE SOCIETY, 345, Strand, London.

During the prevalence of Cholera, Policies for three months (renewable, if required, at the expiration of that period) are granted by this Society, covering the risk, not only of Cholera, but of all other diseases. Rates may be obtained at the Office.

Annuitants admitted to a share in the Profits.

No charge for Policy Stamps.

Credit given for half the Premiums.

Assignments and Transfers of Policies registered free of charge.

A liberal commission allowed to Solicitors and Agents on the introduction of business.

ANTHONY PRICK, M.A., Actuary and Secretary.

## Infants' New Feeding Bottles.—These

celebrated Nursing Bottles, the best Artificial Mother ever invented, enabling the most delicate infant to feed from its birth with the greatest comfort and ease, are adapted to milk, biscuits, and all kinds of food. The Nipple, of novel material, is elastic, soft, durable, very cleanly, and so beautiful an imitation of nature, that no infant ever refuses it.—BENJAMIN ELAM, 186, Oxford-street.—7s. 6d.—Each is stamped with my name and address.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

## Important Saving, by Pre-payment,

in the PURCHASE of

NEW WHITE MOULDED VIALS.

APSPLEY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

1 oz., 1 oz., & 1½ oz. per Gross, 6s.	
2 oz. " 7s.	
3 oz. " 8s.	
4 oz. " 10s.	
6 oz. " 16s.	
8 oz. " 18s.	
4½ oz. graduated in 3 doses 12s. 6d.	

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSPLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

## Cotyledon Umbilicus.—Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 26th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 6s. 4d. per lb.

Insipiated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's) Liquor, or Fluid Extract, prepared by Spontaneous Insipiation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lyttæ P.L., easily applied and removed, and will not produce stranguary or troublesome after-sore. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction."

60, Grosvenor-street, London.

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. BROWN'S BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicator, when carefully applied, and has not been productive of any degree of Stranguary.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 42, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

## Introductory Address,

DELIVERED AT

ST. THOMAS'S HOSPITAL,

October 2nd, 1854,

By SAMUEL SOLLY, Esq., F.R.S.

MR. PRESIDENT, TREASURER, AND GENTLEMEN,—The 1st of October is a date which has long been hallowed in the memories of the medical profession. The mention of it brings back a crowd of mingled feelings. It is the date of a day which first ushered us into the serious study of our profession. With many of us, years have rolled by since the advent of our initiatory day: with none of us can the memory of that time have faded altogether. The fears and hopes, the longings and yearnings after a position in our profession by which we might obtain a noble name in science, must still rise to our recollection when, on the 1st of October, we revisit the scenes of our youth, either with our sons or our friends' sons, to embark them in the same career which we, with varying success, have so long pursued.

I am confident that these reunions are useful to us all. It is pleasant for old students to meet together and recal the joys of their pupilage. It is pleasant for teachers to meet their old pupils again, and learn from their own lips some details of the result of their mutual labours. It is pleasant—it is more than pleasant, it is gratifying and encouraging to the profession as a body—to find the wealthy governors, men in high positions in the commonwealth of trade, meeting us on these occasions to testify by their presence the interest they feel in the success of our Medical School, and the progress of scientific attainments.

It is a privilege, my friends, to meet in this grand old hall, hallowed by the memories of the great and good men who founded with their wealth, and ennobled by their deeds, this glorious Institution.

In these days of reform, when the march of intellect is really making a visible progress, there is great danger of the good which our ancient institutions have effected being lost sight of, and only their faults and deficiencies remembered.

The ancient Corporation of London has undoubtedly much that requires amendment; but we, gentlemen, as officers of St. Thomas's Hospital, must never forget that the Lord Mayor and citizens of London founded this Institution. Edward the Sixth, of pious memory, took his part in the noble undertaking; but without the munificent liberality of the much-abused Corporation of London, St. Thomas' Hospital could not have been established.

It is true that, 700 years ago, St. Mary Ovarie, with the money which she inherited from her father, the Charon of the Thames, laid the foundation of an eleemosynary establishment, from which has sprung the present valetudinarium of St. Thomas; but in the fifteenth century it was seized by Henry the Eighth as church property. After his death, the citizens of London, with the sanction of Edward the Sixth, formed a board of inquiry as to the best mode of relieving the misery of their more unfortunate brethren. The result was, that they purchased of Edward the Sixth the Manor of Southwark, including the site of this Hospital, for £647 2s. 1d. The Hospital, having been unoccupied for a short time, was fast falling into decay, so the worthy citizens in 1551, at an expense of 1000 shillings, repaired and fitted it for the reception of 300 patients. In 1552 they appointed a

Chaplain, with an annual fee of £10	0	0
Clerk	10	0
Steward	6	13
Butler	5	0
Cook	8	0
Physicians and Chirurgeons, each	15	0

You see, therefore, by the relative amount of salaries, and the difference in the value of money, that the founders of the hospital considered their medical officers entitled to remuneration.

About a month before the demise of Edward the Sixth, he incorporated, by Royal Charter, the Lord Mayor and Commonalty of the City of London in succession, as perpetual governors of this hospital, affording unmistakable evidence of the credit which this monarch gave to the corporation of London for their charitable deeds.

Let honour be to whom honour is due.

Yes, gentlemen, the church and its votaries, the citizens of London, the monarchs, and the nobles of England, have given No. 1623.

their money to found this noble institution; but, without the medical profession, it would have remained as in the days of St. Mary Ovarie, an almshouse, not an hospital.

The thousands of pounds which private charity has expended on the building in which we are now assembled, and the thousands more which have been paid to support its unfortunate inmates, would have been comparatively useless if men had not been found to study medicine and dispense the healing art.

Before the existence of Medicine as a science, St. Thomas's Spital was in being, but it was only as a resting-place for pilgrims, and a place of refuge for the destitute.

But you must not suppose, my friends, that the erection and endowment of this and other hospitals was sufficient to educe the science of Medicine. No, something more was wanting. Many years subsequent to the reign of Edward the Sixth we find the practice of Medicine in a miserable state. Macaulay tells us, in his account of the death of Charles the Second, that fourteen doctors deliberated on his case, contradicting one another. "Some of them thought his fit was epileptic, and that he should be suffered to have his doze out. The majority pronounced it apoplectic, and tortured him like a wild Indian at the stake. Then it was determined to call his complaint a fever, and to administer bark. One physician, however, protested against this course, and assured the queen that his brethren would kill the king among them."

Let me now ask you, gentlemen, why the physicians of that day were so ignorant of their profession, why they could not tell of what disease the king was labouring? The answer is an important one to those who are entering the profession: they were ignorant of anatomy, physiology, and pathology. They had patients enough under their care at St. Thomas's and Guy's, but they had no anatomical schools.

The governors of these noble establishments had then only half understood their duties and responsibilities. They paid their medical officers for their services, but they did not provide for their proper and efficient education, without which their practice was empirical and their services imperfect. The ignorance of the surgeons also of the art of prescribing, even a few years later, (in 1689), may be presumed by the following minute in the records of this hospital:—

"General Court.—"Ordered, that the ancient rule of this hospital, that no chirurgeon shall give any physic to any patient admitted into this house, but that the doctor alone be left to prescribe physic to all patients, be confirmed, and for the future strictly observed."

But strange to say, gentlemen—and the fact is one amongst others which might be adduced to show how rules adopted in times of darkness, are often absurdly continued unto days of light—this rule has only been abolished within my own time. I remember, when I was attending the physicians' practice with Dr. Scott, in 1824, Mr. Green's book being handed to him to sign, as a permit for the dispensing the medicines he had provided for his patients, Dr. Scott remarked contemptuously, "These surgeons have quite a *cacoethis scribendi* now-a-days." This observation was not justly applied to our respected consulting surgeon, for I can say, without fear of contradiction, that his knowledge of medical surgery was only equalled by his power as an operator. He never said "Thank God, gentlemen, I know nothing of medicine!"

There are none of us, however long we may have been engaged in the study and practice of our profession, who do not feel that we occasionally require reminding of the weighty and solemn character of the duties we have undertaken to fulfil. If this observation applies to men who, in the active discharge of their duties, necessarily, from the very fallibility of human intellect, meet with severe losses to stimulate them to constant study, how much more will it apply to those who are only commencing their career, and who cannot possibly conceive the difficulties to which they will one day be exposed?

Our profession must not be embraced merely as a source of emolument. The alleviation of the distresses of our fellow-creatures ought to be our first consideration. We are not irresponsible agents. We are the servants of the public, and by our ignorance or knowledge may scatter misery or diffuse blessings. If a man in trade fail in his undertakings he suffers the penalty of his ignorance, not necessarily involving the happiness of others. But with us the health and happiness of our fellow-creatures are more or less in our hands; and if we, through ignorance, sacrifice the lives of our patients, we commit crimes for which we shall be accountable to an All-wise Judge hereafter. It is, then, my friends, a matter of the deepest moment to you at this season of your lives, so to study

your profession that, in future years, you will be able to look back without regret upon this the seed time of your education.

All that the student of medicine can obtain by the study of his profession at any hospital, however large its wards and excellent its school, is a knowledge of *general principles*. It would be absurd to suppose that he could, in the limited period allotted to his studies, see each individual shade and form of disease to which this flesh is heir, or that his instructors have it in their power to bring before his imagination, by description, the symptoms and treatment of all the Protean forms of morbid action which occur in the human frame. What memory is so retentive as to treasure up for immediate use even the limited number of facts and observations presented to his notice during his studies at the hospital? *None*, I venture to assert, without fear of contradiction. How then should you be prepared to meet the difficulties which the private practice of your profession will inevitably involve? What is the *armour* we should prepare in the time of peace, in this our workshop, to combat successfully the awful, and frequently appalling, diseases which meet the superficially educated man like horrid spectres, from which retreat is impossible and defeat fatal? I am sure my friends that, as travellers into a new country, you will not despise the advice of one who has travelled the same road.

Thirty-two years ago, on this very day, I commenced the same journey, with high hopes and lofty aspirations. Some have been crushed, some crumbled into dust, some faded away; but with all this I would, if I could retrace this portion of my life, start again with joy and hopefulness on the same track. The improvement which has taken place in the general education of the medical student in the course of the last thirty years is so great, that your course is comparatively plain before you. The idle, the dissolute, and the profligate medical student is now the *exception* to the rule. The time when ribaldry and profane language could be uttered in the library or the dissecting-room, without bringing on the utterer the contempt and disgust of his fellow-students, has passed away. Gentlemanly demeanour and steadiness of conduct in the wards is now as characteristic of the great body of the students of St. Thomas's Hospital, as courtesy and kindness of manner is the distinguishing feature of the British physician. Most freely and frankly can I say that the medical students, as a body, have advanced greatly in all the essential qualities of gentlemen. I wish I could say as much for the advance which has been made in the practical study of their profession, but I cannot. I am convinced that of late years the dissecting-room has been seriously neglected. I know that there have been some noble exceptions; but these are exceptions; they do not form the rule. You would all acknowledge, if you were asked, that anatomy is the corner-stone on which all your knowledge must be reared; yet many students seem to forget that anatomy can only be learnt in the dissecting-room. Lectures and demonstrations teach you *how* you ought to learn it, but that is all. No man ever learnt his anatomy, so as to serve him in the hour of need, without constantly dissecting during the winter sessions. There is no study so interesting, I can honestly say so fascinating, as anatomy. Some of the happiest hours of my life I have spent in the dissecting-room. If you do not like dissecting you will never make a surgeon. The committee of lecturers, strongly feeling the importance of devoting many hours every day to practical anatomy, have so arranged the order of the lectures that you will now have four clear hours for that purpose. This arrangement has not been made without personal sacrifice and inconvenience on the part of the lecturers, and I trust therefore that you will all show, by your future conduct, how much you appreciate their consideration.

Next to practical anatomy in the order of your studies comes physiology—the science of life. If the study of the mere machinery of the human frame is interesting, what must be said of that science which teaches us the laws by which that machinery is worked? The laws which regulate disease are at present but little known, and the obscurity which envelops them is still a great drawback to the successful practice of the healing art. John Hunter, the most profound genius our profession could ever boast of, considered that the backward state in which he found the art of surgery—for previous to his time it could not be called a science—was owing to a shallow and theoretical physiology; that the ignorance of his contemporaries regarding the practice of surgery was due to their still greater ignorance of the laws of life. He therefore first devoted all his energies to the study of physiology, not confining himself to the narrow limits of the human frame, but extending his researches to vital phenomena, as exhibited by all living beings. And you, my young friends, must do the same; for the study of physiology is not merely necessary to the great pioneers of surgery, to those who live to extend our knowledge of its

truths, but to all and each of you who would understand them for the purpose of practising the healing art.

John Hunter, from an accurate and substantial knowledge of universal, not mere human, physiology, was enabled to establish those most important doctrines of inflammatory action which have raised surgery from an art to a science, and which have enabled both physician and surgeon to act with decision as in the light of day, where before they were trembling in the dark or rushing forward in blind and rash ignorance. Yes, gentlemen, though we can none of us expect to do for surgery what John Hunter did, we must all pursue the same course, or we shall do nothing, even for ourselves. It is principles, not phenomena—laws, not isolated, independent facts, which you must study. If you do not begin by taking a pleasure in investigating the causes of disease you will do nothing. A habit of reasoning on the facts which present themselves to your notice is essential to success in our profession. The widest field of observation, rich in medical phenomena, is utterly useless without this habit. The experience of years in the most extensive practice is vain and valueless to the individual who has neglected to acquire it; and I believe that without the study of physiology it has never yet been obtained. But the study of physiology alone will not give it. It is not to be acquired in a day; it must be sought for with earnestness and determination. Attention, constant unremitting attention, will alone give it. The time has been when you might meet two physicians, the one prescribing for symptoms, the other viewing the symptoms only in so far as they were indications of the disease from which they sprang. The latter a physiologist, the former ignorant of the science, except in name.

I consider, then, anatomy and physiology the essential groundwork of the profession. Pathology springs from them, and they are of little use if they do not lead you to its study. Materia medica and chemistry are essential, and I have always observed that the man who ridicules the power of medicine, does so because he is ignorant how to use the tools which have been graciously bestowed upon us by a bountiful Providence.

The division of labour which takes place in a large capital like London is useful. It is advantageous to the public that certain men should especially devote their attention to the performance of operations, for constant practice as an operating surgeon alone gives dexterity. I cannot agree to that cant which would decry all operations as the *opprobria medicorum*. A carefully-considered, judiciously-contrived, and skilfully-performed operation is a noble act. It requires a combination of qualities which are not often met with.

"No surgeon," as the immortal John Hunter remarked, "should approach the victim of his operation without a sacred dread and reluctance; and he should be superior to that popular *folat* generally attending painful operations, often only because they are so, or because they are expensive to the patient." But, on the other hand, he must never shrink from his duty as an operating surgeon, either from the fear of inflicting pain, or from the fear of being blamed if his operation is unsuccessful. If by the performance of an operation, dangerous, difficult, and therefore deeply anxious to himself, he sees a reasonable prospect of being able to save the life of a fellow creature, he must not weigh in the balance for one moment what the world or even the profession will say, if that operation after all his care and skill should prove fatal.

The introduction of chloroform has, it is true, saved the surgeon much of the pain of seeing his patient suffer, but in some respects it has added to his anxiety. He has to contend with the danger of chloroform as well as the danger of hemorrhage.

There are no words by which I can express the true feelings of a conscientious, humane, though bold and skilful surgeon, when called upon to decide, perhaps in the dead of the night, alone, and without the power of consultation, between the loss of a limb and the loss of life. He feels how sad a thing it is for any man, but especially a labouring man, to lose a portion of his body—one of the instruments whereby he gains his daily bread. On the other hand, he cannot but think of the orphan and the widow, and hope that the Almighty will guide his hand to save a father's life. It is on these occasions, gentlemen, that you will remember the days of your pupillage at St. Thomas's, and grieve that you did not study more diligently and acquire more knowledge to guide you in your hour of trial. The physician has his hours of care and doubt, but his cares and anxieties are far surpassed by those of the operating surgeon, however great his medical skill, and however deeply fortified by practical experience.

In the dissecting-room you must acquire that knowledge of anatomy, and that dexterity in the use of the knife, by which

alone you can become skilful operators. During the short period that you are able to stop in London you will not have a single hour to spare. You ought always to be in the dissecting-room during the time devoted to that purpose. Whether you have anything to dissect or not, you can still be learning, looking over others; not gossiping and smoking, but studying in serious earnestness.

Do not, however, misunderstand me. The knowledge you are to acquire in the dissecting-room is only a very small portion of the acquirements essential to a good surgeon. It is no use your knowing how to perform an operation skilfully, if you cannot treat your patient skilfully afterwards. This knowledge must be acquired in the wards of the hospital, not alone in the surgical wards, but in the physicians' as well. You must study medicine most diligently. You will meet with ten medical cases in private practice to one surgical, and that one surgical case you cannot treat properly if you are ignorant of medicine. No doubt there is more to catch the eye in the surgical wards, and the results of surgical treatment are more easily understood and observed; but that is no reason for devoting exclusive or even greater attention to surgery. The advance which the science of surgery has made in this country, during the last thirty years, has been most remarkable; most gratifying to humanity in its results. It is not merely that the great body of surgeons are better operators than they used to be; it is not merely that the deaths from operations are on the whole fewer than they used to be; but it is this,—that more limbs are saved by the judicious and early interference of the surgeon. Many a foot and hand, many a leg and arm, have been saved in the last ten years, which even, twenty years ago, would most certainly have been sacrificed. These especial operations constitute what has been fairly called conservative surgery, which, like true conservative politics, consists in the removal of abuses, but without the removal of time-honoured institutions. In either case the object is to correct and improve, not to uproot and destroy. In the science of surgery, chloroform has enabled us to perform many operations which, previous to our knowledge of it, we should have regarded as cruel, lest they should not be final. But chloroform alone has not established conservative surgery. Without medicine it never could have advanced as it has done. The surgeon is no longer a mere chirurgeon, or handy craftsman. He must be a sound pathologist, he must be a good physician, or he is no surgeon in the proper meaning of the term.

Surgery and medicine are one, and there must be no distinction, gentlemen, between them in the study of your profession. It is with feelings of pride and pleasure that I remind you that one of the late surgeons of St. Thomas's Hospital, I mean my old master, Mr. Travers, has done as much, if not more than any single individual, to improve medical surgery. He was one of the first to rescue the diseases of the eye from the hand of the empiric, and ophthalmic surgery at that time was so much neglected that he ran great risk of injuring his surgical reputation by even touching it. In this department of surgery, Mr. Travers was ably succeeded by our late colleague, Mr. Tyrrell; and any one who reads Mr. Tyrrell's inestimable work on "Diseases of the Eye," will see how entirely his treatment rests on the pathological employment of internal remedies. There is no branch of surgery which has thrown so much light on the value of medicine in the treatment of disease as ophthalmic surgery. I feel confident, as I have stated elsewhere, that if the same line of treatment had been adopted in the treatment of diseases of the brain as was pursued so judiciously by Mr. Tyrrell in diseases of the eye, much greater success would have attended the treatment of the insane. The benefits which Mr. Travers conferred on surgery were not confined to ophthalmic diseases. His works on "Constitutional Irritation" rank only second to John Hunter's on "Inflammation." When you read them carefully, which I trust you will, you will see more clearly demonstrated than has been done by any previous surgeon, that the attempt to treat external diseases by mere external treatment is idle empiricism. The connexion between local injury and constitutional disturbance is most powerfully illustrated. The chart which he has produced of the pathology and treatment of constitutional irritation is so clear and definite, that no honest surgeon would think of launching into the troubled sea of surgery without having studied it carefully, and deeply imbued his reflective faculties with its truths. Mr. Travers' work on "Injuries of the Intestines," though not so generally known, or so peculiarly medical, is one of the most useful of modern contributions to the science, and one of which this hospital may justly be proud. "Medical surgery," says Mr. Travers, "is the offspring of the scientific study of our department of medicine; and I am disposed and desirous to believe that it is the characteristic distinction of the surgery of this

country. Wherever the local disease is important, from its seat, its character, or its origin, the constitution, its powers and habits, become so intermingled with it, that to regard either exclusively, or to assert that they admit of being so regarded, is the worst, because the most dangerous, empiricism."

The diagnosis and treatment of hysterical affections of joints, constitutes a most important section of medical surgery, and most ably has this subject been treated by Sir Benjamin Brodie, who justly ranks as one of the first, if not the very first, surgeon of the present day.

Injuries of the head strictly come under the dominion of the surgeon, but how soon the external treatment of these injuries sinks into nothing, as compared with the medical treatment of the brain and its membranes—how soon the surgeon has to balance, especially if his patient is amongst the inhabitants of a large city, between those symptoms which are the result of the injury, and those which follow the effect of antiphlogistic measures on a shattered constitution, or that nervous depression which is caused by the withdrawal of a hard drinker's accustomed stimulus. In this stage of the treatment an ignorant man may soon hurl his patient into eternity. Those of my hearers who are about to leave the hospital, having employed their time diligently in the medical wards, will recognise the truth of my words with pleasure, and rejoice that they have studied the treatment of diseases of the brain under the physician, with the same care that they have watched the progress, both pathologically and physiologically, of injuries of the brain under the surgeon; while those whose time for study is expired, whose money is spent, and who must now provide for their own subsistence, but who have neglected the wards, and still only know of diseases by their names, will mourn over their wasted time and ill-spent hours. From both these classes you may learn something—you may learn what to aim at and what to avoid.

There is no profession which holds out such noble marks to aim at. There is no member, if he will study it diligently and practise it conscientiously, who may not advance its progress. Much, very much, has been done in late years, but our science is still imperfect. More, perhaps, may be done to stimulate to the good work, by calling your attention to the progress that has been made, than by any attempt to show its deficiencies. Let us glance rapidly at some of our improvements. Take the motive organs of the body—bones, joints, muscles:—

Caries, or ulceration of bone, whether involving the bones of the shoulder-joint, the elbow, wrist, hip, knee, or ankle-joints, used formerly to be an almost certain cause of mutilation. It was supposed that this gnawing disease, which crumbles away the bone and wastes the body, pouring forth from the crimson current of the blood, the elements of nutrition, could only be removed by the amputating knife. In the present day, we limit our operation to the removal of the disease, and preserve the sound portion of the limb. Nature proves herself a most kind and able assistant in these conservative operations. Take, for instance, the shoulder-joint. A patient comes to you with an arm, useless, painful, and debilitated from disease. He tells you—and I am now referring to no hypothetical case—that he was told in the country that he must have his limb removed, or die from the disease. He had heard of St. Thomas's Hospital in London, and he walks up, above 200 miles. He is admitted, and he has all the advantages which this institution can confer. The shoulder-joint is cut into, the diseased bone is removed, the soft parts soon heal, and nature actually models for him by her absorbent vessels a new joint, and the man returns home with an useful limb.

This description, true to the letter as regards this hospital, is, I am sure, equally true in its main features in regard to every hospital in the United Kingdom. The operation of excision of the shoulder-joint was first performed in 1769 by a provincial surgeon, Mr. White, of Manchester.

Then, again, take the elbow-joint; its structure is more complicated, but still we do not hesitate to remove the diseased parts, and in process of time a new and useful joint is formed.

This operation was first designed by Moreau, a Parisian surgeon; but we are immensely indebted to Mr. Syme, of Edinburgh, for having perfected this proceeding, and, by the frequent repetition of its performance, showing us how safe an operation it may prove in the hands of a good and skilful medical surgeon.

Mr. Anthony White, of the Westminster Hospital, in 1818, succeeded in curing disease of the hip-joint by excision of the head of the thigh bone. The second successful case was in the practice of my friend, Professor Fergusson, of King's College; since then it has been performed sufficiently often to establish it as a recognised operation in suitable cases. I performed it a

few years ago on a patient in this hospital, with every prospect of success. The case went on well in every respect for several days, when erysipelas, that dread foe of operating surgeons, attacked my patient with fearful intensity, and he died in a few days.

From the hip-joint we may descend to the knee. This beautiful and complicated joint is, I think, more frequently the subject of that amount of severe disease requiring amputation of the limb than any other joint in the body, but still how seldom are we obliged to amputate this joint to save life. It is indeed true that many a limb is now saved by medical surgery which formerly was sacrificed, and I must give my esteemed friend, the cod-liver oil, considerable credit for his assistance in the good cause. More than fifteen years ago, I first prescribed this medicine for strumous disease of joints, and I soon found its value. I have no hesitation in saying that we are able to carry out our conservative operations with this ally which would be quite impracticable without it.

With regard to excision of the knee-joint, I can give you no personal experience, but the cases which have been published encourage me to believe that it may be performed with success. And there can be no doubt that the living limb, even if shortened and the knee-joint obliterated, is more useful and more agreeable to the patient than any artificial limb, however beautifully that limb is made. I must bear my testimony to the perfection to which these mechanical contrivances are brought. This operation was first performed by Mr. Fitkin, of Northwich, and was in his hands successful. Again you see, my younger friends, an instance of an important improvement in surgery being introduced by a provincial surgeon. Most of you, in all probability, will be provincial surgeons; let these facts encourage you to emulate such bright examples. Those who aspire to become London surgeons, let it stimulate to support the character of the London School of Surgery. The next operations were by Mr. Park, of Liverpool, in 1783; by Moreau and Mulder in 1809; by Crampton, of Dublin, in 1823; Syme, of Edinburgh, in 1829 and 1830. Then the operation was discontinued until it was revived by Professor Fergusson, of King's College, in 1850. Since then it has been performed thirteen times:—three times by Mr. Fergusson; six by Mr. Jones, of Jersey; once by Mr. Page, of Carlisle; once by Mr. Stewart, of Belfast; twice by Mr. R. J. Mackenzie, of Edinburgh. Of these thirteen cases, three died; one of dysentery. These facts are enough to demonstrate that the operation has not been performed without a fair result. Nevertheless, there are very few cases in which such an operation should be thought of. From my own experience of the treatment of diseased knee-joints, I am convinced that there are very few cases where ankylosis may not be obtained without any operation at all. The older students will remember some cases in this hospital which justify me in making this assertion.

In passing from the consideration of excision of the knee-joint to the conservative surgery of the rest of the leg, I find it impossible to tell you all that has been done. I must only attempt a rapid sketch. When I first came to this hospital in 1822, almost every amputation for disease of the leg and foot was performed a little below the knee. The value of a long lever in the use of an artificial limb was not understood, but now we save as much as possible. Amputation at the ankle-joint was never thought of. This operation was first proposed and performed in France, by Sedilier, Velpeau, and others; but the credit is due to Mr. Syme for having shown its frequent application. The retention of the firm cushion of the heel for the surface of the stump has been of immense practical importance; and there are many men now who have been subjected to this operation who might go into any ball-room in London without the deformity being discovered. The operation is required in extensive disease of the tarsus, and it is an improvement on the old mode of amputation; but still there is an improvement upon this. Many of you have seen this carried out successfully within these walls. I refer to the removal of the diseased bones instead of a removal of the whole foot.

I now show you two casts of the right and left feet of a boy who lately left this hospital, quite well, able to walk firmly and painlessly, in whom I removed the whole of the articulating surfaces from both ankle-joints, and a considerable portion of the astragalus, os calcis, and navicular bones. He was in the hospital about two years. I have had many other cases, both in private and public, very similar in result. One of these interested me exceedingly. The patient was a young lady, fifteen years of age. The disease involved the whole of the centre of the foot, all the cuneiform and cuboid bones. A simple sprain when dancing was the sad cause of this mischief. Amputation seemed inevitable; but as an operation under

chloroform involved no pain, I determined to try the effect of removal of the diseased bones. I operated first, on the 13th of August, 1852, and on the same date this year, I received a note from her father, in which he says, "I have just returned from church with my daughter, where she walked a distance of half a mile, and returned without crutches or stick. She did not lean on my arm more than a sound person would have done, and no one would have remarked that she was at all lame."

These are the cases, gentleman, which will reward you for many years of anxious unrequited toil. They are God's mercies to encourage us in the performance of our duty.

The operations which of late years have been performed for the cure of deformities are in the highest degree laudable to surgery.

Emanating from Professor Stromeyer, of Hanover, they have been most successfully carried onward in this country by Dr. Little, the founder of the Orthopædic Hospital, by Mr. Tamplin, his successor there, and by a host of other surgeons. These operations consist mainly in the division of tendons, the muscles of which have contracted unnaturally, drawing together portions of a limb, so that the foot, so straight and perfect in a state of health, is drawn into a club-like form. In most cases of club feet, the division of the contracted tendons, with the application for some period of instruments which keep the distorted parts in their natural position, is sufficient for a cure. But there are cases in which the deformity is so great, the bones as well as the tendons and muscles being at fault, that it had occurred to Dr. Little and myself, that the removal of one of these bones of the foot would expedite the cure. This operation, the removal of the cuboid bone, I performed, with the advice and in the presence of Dr. Little and my colleague, Mr. William Adams, of the Orthopædic Hospital, during the course of the past summer. The result has been most satisfactory. The entire case shall be published; but I am glad to have the opportunity of putting this fact first on record within the walls of my alma mater.

In an address like the present, when I am honoured with non-professional auditors, I cannot attempt to refer to all the improvements which have taken place in operative surgery, but I must say a few words on the subject of the urinary organs.

I think that the profession is much indebted to my friend, Mr. Cock, for having re-introduced an operation for the relief of retention of urine which had fallen into disuse. I refer to puncturing the bladder through the rectum. Mr. Cock published some time ago details of thirty-eight cases in which this operation was successful. I have followed his plan on several occasions, and I am perfectly satisfied that the operation is one of the most useful in surgery. I cannot say the same of Mr. Syme's, in which he recommends the division of the stricture upon a director, and for this simple reason, that I have never failed in curing a stricture by bougies, after having once succeeded in passing one, however small that one may be in the first instance. If you can pass a director, you can pass a bougie; and when you can do that, the operation, in my opinion, is unnecessary. I am bound to say that I find the cure in these cases much accelerated by the use of a long bougie and a tube passed over it, as recommended by Mr. Thomas Wakley, jun. I prefer the catgut bougie, coated with elastic, and a conical elastic catheter over it. I have been much indebted to Mr. Bigg and Mr. Millikin, of St. Thomas's-street, for the beautiful instruments they have constructed for me on this principle.

Time reminds me that I must not overwhelm you with surgical details. I trust that I have said enough to encourage my young friends to love and admire the profession which they have this day commenced. May they show their love and admiration of it by devotion to their studies, by attention to their teachers, and by respect on all occasions to the authorities of the hospital. I trust that I have said enough to convince the authorities of the hospital that our profession is worthy of the interest that they take in it, and I hope it will encourage them to continue that liberal support which of late years they have so willingly bestowed.

I must not conclude this address without adverting to the fearful pestilence which has devastated the land: first, to express my deep regret that so little has been done by those who now possess the power to suppress the fearful causes of cholera, which still exist in the suburbs of London and the Borough; secondly, to congratulate you on the signal success which has attended the exertions of our physicians; but still more the constant, unremitting labour of our resident medical officer, Mr. Whitfield, to whose care may be attributed the relatively small mortality which has occurred in this hospital.

## Abstracts of the Introductory Lectures

DELIVERED AT THE

## VARIOUS MEDICAL SCHOOLS IN LONDON,

AT THE OPENING OF THE SESSION 1854-55.

## ST. BARTHOLOMEW'S HOSPITAL.

## INTRODUCTORY LECTURE BY DR. BURROWS.

In the evening, Dr. G. BURROWS delivered an appropriate lecture to a crowded theatre. Previously to the address of the lecturer, the Treasurer, in feeling terms, condoled with those present on the severe loss the hospital had very recently sustained by the death of Dr. Roupell, whom he warmly eulogised for his uniform kindness and amiability, and the zeal he had ever manifested in the exercise of his profession for the aid of suffering humanity. The Treasurer took occasion to add, however, that great cause of satisfaction and thankfulness existed in the hospital, inasmuch that, although 300 cases of cholera had been treated there, not one of the officers or nurses had fallen a victim to the disease in consequence of the performance of duties within its walls. Dr. Burrows, whose delivery is clear, deliberate, and agreeable, addressed his observations mainly to those who are entering upon their studies: he reviewed medicine in its chief aspects, cautioned students against expecting to reap wealth and honours easily by the practice of the profession in which they had embarked, but endeavoured to impress upon them how much more pleasure the cultivation of the highest powers of their minds would confer upon them through life, than could be enjoyed by the heirs to wealth who had unfortunately no occupation. He praised the collegiate system, as established at St. Bartholomew's, and to it he in part ascribed the higher tone of feeling and better manners which characterized medical students of the present day than had been attributed to them by popular writers not many years ago. He gave a sketch of the various subjects which would successively occupy their attention throughout the curriculum of their studies; pointed out by what means they would be assisted in their labours; and canvassed the comparative merits of the three modes of acquisition of medical learning—by lectures, by clinical observation, and by books. His remarks on all these heads we considered very judicious. In the course of his lecture he quoted a very eloquent and impressive passage by Professor Bowman, inculcating in the dissecting-room a respect for the dead; and in announcing that the distribution of prizes at the College had been postponed on account of the sudden and unexpected decease of Dr. Roupell, he again paid a tribute of respect to the memory of that physician. The names of the medical tutor, of Mr. Paget, and Dr. Black, mentioned in the course of the lecture, called forth vehement applause, and at its end Mr. Paget, Mr. Skey, and others were heartily cheered as they left the room.

## CHARING-CROSS HOSPITAL.

## INTRODUCTORY LECTURE BY DR. CHOWNE.

DR. CHOWNE commenced his address by remarking that the resuming of duties which partake of an academical character is necessarily an occurrence of interest both to the teachers and to the students; and that amongst other agreeable features of a new session was the evidence of zeal and industry evinced by the classes after a short but salutary vacation, and, on their return, to participate afresh in those exercises of the mind which, during the medical session, are required.

He proceeded to say: the student of a former year may be presumed to have his plan for that which is now commencing arranged in his mind. That the benches of this theatre, however, are not wholly occupied by pupils to whom these remarks could apply, but by others to whom the incidents of an opening session are wholly new; who, although seated amongst those whom they may now call fellow students, can recognise no familiar faces. The pupil who is but on the threshold of this curriculum might be deemed to have a far less defined view of the path before him, and his position might well occupy consideration in an introductory address.

He is generally not only new to the epoch, but new also to the social circumstances in which he is placed in this great metropolis, and new to those with whom he must almost daily mix. Although such young men may not have wanted for the parental guardianship, nor for those invaluable precepts which constitute the moral training of youth; although proper sentiments have been impressed, and proper habits inculcated,

and have, in the routine of home occupations and of home associations, been preserved, yet men who have watched through a series of years the results of early removal of young men from the salutary influences of judicious discipline and control, suddenly, and at once, into a region where they find themselves in a state of almost absolute freedom, to choose their companions, their occupations, and their amusements at will, cannot fail to know that in such a change of circumstances a change of habits often lurks. Hence the immediate object which brings them within these walls, the study of an abstruse and difficult science, is not the only matter which either deeply interests their nearest and dearest friends, or concerns their own advancement in their profession, and, indeed, their welfare and happiness through life.

The lecturer, after making some further remarks upon this subject, and offering some suggestions of advice, adverted to the advantages of a high standard of education, as improving the capabilities of the medical student and elevating his character, proceeded to say, he should be only following a spontaneous impulse, in submitting to those students who are either now entering upon, or continuing what might technically be called one of the last stages in their medical studies—viz., the medical curriculum, that the undertaking might not inappropriately be called a first step in life—that is to say, how to live; how to embark in life on their own responsibility; to acquire good standing in their profession, and honourable positions in the world; and, finally, in the course of events, to extend to others the support, and care, and help they had themselves received. Such a position cannot be secured upon a firm basis in the absence of correct conduct and good principles; even wealth acquired in the absence of these does not produce happiness, does not bring respect, does not confer social elevation. The young man's first care, then, should be, to maintain a character founded on the constant propriety of his conduct, and on the strict integrity of his principles.

The lecturer, after urging the propriety of care in the formation of friendships, and the dangers of bad example, directed the attention of the students to the course of study before them, to the well-arranged order in which, according to the injunctions of the examining bodies, they are arranged, and especially to the fact, that the period of time allowed is not too long, proceeded to say, Let the students then keep constantly in their mind, not only that they have much to achieve, but that the step of time is stealthy and fleet; let them not forget, that although they take their places on the benches of this theatre, youthful in years, youthful in position, and youthful in feeling, they aspire to the attainment of a high station. It is their hope and their ambition to quit these benches members of one or more of the learned, and great, and honoured, institutions of the country; that their names shall be recorded in the archives, and certified in the diplomas, of these institutions, as having been admitted into co-membership with some of the highest men in our profession; and as being, like them, empowered to take rank and position; and, more important still, to exercise functions consistent only with manly intelligence and mature reflection. This is the transition desired; these are the ambitions indulged; and the better the judgment of the candidate, the more conscious will he be that the prize is such that it cannot be, and, indeed, should not be, of easy attainment, and that therefore he should seize the very first opportunity, and every opportunity, of proceeding in anxious and sedulous earnest.

The Doctor gave illustrations of the bearings which the different branches of medical science have upon each other, and of the advantages to be derived from the resources afforded by natural philosophy; and adverted to the constantly advancing tone and position of medical science as it presents itself to each successive generation; and concluded by observing, that "It is one of the advantages of an education for our profession that the student has always before him highly-interesting occupations. In the study, for example, of anatomy and physiology, embracing the various structures and phenomena of the human system, he enters at once upon a track which daily unfolds to his view the elements of researches in natural history, researches which constantly tend to enlarge the foundation for future progress and larger views, and to qualify him for the attainment of knowledge extending over the whole range of animal and vegetable structures, and of animal and vegetable life; while, in the laboratory of the chemist, he becomes familiar with the productions of nature in their inorganic forms, thus supplying the basis for future prosecution of the purely physical sciences. Let those young men, then, who have not had already a perception of the valuable information to be acquired in the course of their medical education, draw no apprehensions nor misgivings from the seemingly arduous

course of study before them; let them, on the contrary, regard the road they are travelling as an instructive and useful excursion, rather than as an irksome journey; let them go cheerfully to work in the full assurance that their labour will abound in interest, not only in the pursuit, not in the immediate possession of the knowledge acquired, but in the foundation it will lay, and the capabilities it will confer, for after-advances in science far beyond their present aim.

### ST. GEORGE'S HOSPITAL.

INTRODUCTORY ADDRESS BY DR. J. A. WILSON.

DR. J. A. WILSON, on taking the chair to inaugurate the commencement of the Winter Session, stated that great efforts had been made to obtain some member of the aristocracy to deliver the opening address; they had even sent as far as Newcastle, but in vain. Apart, however, from the honour conferred, he considered little benefit would be likely to accrue from the distinction, for although those elevated personages were very civil, they seldom afterwards manifested any particular interest in the prosperity of the establishment. On delivering the prizes and certificates to their recipients, Dr. Wilson spoke in terms of great praise and encouragement to each, and when presenting Sir Charles Clarke's award for general conduct to Mr. Dickinson, he feelingly alluded to the gentleman who had first received that honour, M. Theodore Dukin, a noble Hungarian refugee, who, when pursued by the Austrian police to England, after enduring the greatest privations, had become a student at St. George's Hospital, and by perseverance and industry had greatly distinguished himself, and now held a prominent position in a foreign service. On each branch of medical science Dr. Wilson made some appropriate remark; he repudiated the notion that midwifery had become a neglected department of the profession, and counselled the different prize-men not to devote themselves too exclusively to those subjects which might constitute their favourite study, and in which they had excelled. He urged them not to be content with arriving at the boundaries of knowledge now attained in their profession, but seek to extend them; and he trusted that the eminent practitioners of 1880, some of whom were doubtless before him, would far exceed in scientific knowledge and practical resources those who were now their instructors. On arriving at chemistry, Dr. Wilson regretted that some other word had never been found as an appellation of distinction between such men as Sir Humphry Davey, and others of the highest scientific attainments, and the ordinary shopkeeper to whom the name was equally applied, who had a blue bottle in his window and sold soda-water, yet who, perhaps, beyond this had a very limited knowledge of the vast science of which he was misnamed a cultivator. In conclusion, the professor strongly advocated the observance of a strict discipline in medical schools, congratulated the pupils upon the improvement in the *morale* of medical students generally, recommended abstinence from tobacco and cigars, and proposed the establishment of a large boarding-house in the vicinity expressly for their accommodation, by which the discomfort of casual lodgings might be avoided. His somewhat lengthy address was very warmly received by a well-filled room, and to many of the students he seemed associated both by a most friendly feeling and personal acquaintance of long standing.

### SCHOOL OF ANATOMY AND MEDICINE,

ADJOINING ST. GEORGE'S HOSPITAL.

INTRODUCTORY LECTURE BY DR. LANKESTER.

AFTER some introductory remarks on the nature of education generally, the lecturer alluded to medical education. This was examined from two points of view: Firstly,—That demanded by colleges and universities for conferring diplomas and degrees. Secondly,—That demanded by the State for the licence to practise. He spoke of the former as being good or bad, according to the college or university; and of the latter, as having no fixed standard in this country, varying with the characters of the examining bodies which had power to confer licences to practise. The lecturer hoped that the present anomalous requirements of the State would be abolished, and that a fixed standard would be required of all who practised any department of their profession. The preparatory education of the medical student was then examined, and the present system of demanding Latin and Greek condemned as unnecessary to the practice of the medical profession, on the ground that one language was sufficient to afford a training in philology, and that nothing material could be acquired by reading a classic

author, beyond what could be obtained by translations. He commended the study of modern languages and mathematics, but more especially the natural sciences, as being useful in aiding the medical student to practise successfully his profession. Such an education was desirable not only for medical men but for all. Legislators, bishops, barristers, and town-councillors, would all fill their duties better if they knew more of natural science. The great majority of the community belonged, with Lord Derby, to the pre-scientific school. The special education of the medical man was then spoken of, under the following heads:—

1. Physics in relation to healthy and diseased actions, and illustrations given from the laws of dynamics, as developed in the muscular system and the production of the phenomena of life in plants and animals by the agency of heat and light.
2. Chemistry in its relations to health and disease, which was illustrated by the great law of deoxidation in plants and oxidation in animals.
3. Comparative and vegetable physiology and pathology, as furnishing the most facile means of investigating the nature of cell-formations and cell-life in the higher animals and in man.
4. The action of inorganic and organic bodies on the healthy and diseased functions of the human body.
5. The indications of disease as presented by deranged functions and abnormal conditions of the tissues of which the organs of the body are composed.
6. Natural actions requiring manual aid and superintendences, as the reproductive function.
7. The relations of death and disease to inquiries arising out of the moral character and social condition of man.

In order to ascertain how far these objects could be obtained, the London Medical School system was examined. The system of teaching in public and that pursued in private were alluded to. The latter, the system of catechising and preparing for examination, was traced, first, to the routine nature of the examinations of the public bodies; and secondly, to the neglect of personal superintendence by the teachers in medical schools. Our teaching was regarded as too much *professional* and too little *tutorial*.

The lecturer then stated the plans about to be adopted in their own School to remedy this defect in the present system of teaching. The alterations in the School were then glanced at, and each new professor was introduced to the audience with his appropriate claims.

### GUY'S HOSPITAL.

MR. BIRKETT'S INTRODUCTORY ADDRESS.

THE introductory lecture was delivered to a very numerous audience by Mr. BIRKETT, who, after a few remarks respecting the importance of the task he had undertaken, expressed himself in the following terms:—"The object, then, of this address appears to be to interest those of my auditory more especially who now for the first time occupy the benches of an anatomical theatre; to endeavour to incite them to pursue the right course; to encourage others to follow the path they have selected; and to deter a few from continuing in the error of their way, in order that all may attain an honourable and distinguished position in the profession they have selected to follow. To impress strongly upon the mind of the medical student the exalted duties of his calling, and to lead his thoughts to the contemplation of the objects and the intellectual and moral influence of the study and practice of medical science, will, then, form the subject-matter of this address; and although I know I am not competent to do it full justice, I rely upon your forbearance, your courtesy, and kindness, (loud applause.) Your presence here to-day is evidence of the path you have selected to follow, and your next object is to qualify yourselves for those duties which more peculiarly belong to the practice of the medical profession—duties which, indeed, involve an immense amount of sacrifice of all personal comforts and interest. Have the younger members of my auditory ever contemplated the responsibilities attached to the profession of medicine, the anxieties, the cares, and the best method of meeting them? Has the thought ever struck them that upon their knowledge may depend the valuable life of the head of a large family, or that permanent deformity may result from their ignorance or neglect? If not, I would have them pause upon the threshold, and before they enter the temple of medical science, examine themselves to see if they are prepared to devote all their energies, all their labour, and all their strength to the acquisition of knowledge! Now, as medical knowledge is devoted to the restoration of animal health, when impaired by disease or injury, it will be at once manifest that a study of the animal

organisation in a condition of health is essential to the comprehension of the changes which occur as to the result of disease. Anatomy and physiology, including chemistry, form, then, the bases upon which all medical science ultimately rests. It seems scarcely necessary to urge this point, so self-evident does it appear; and, perhaps, it is more from thoughtlessness than from design that anatomy is so little prosecuted by the majority of students. Anatomy, gentlemen, is essentially a science of facts—facts incontrovertible and incontestable, clearly and easily demonstrable by those who seek for them, and of such a nature as to lead the mind of him who contemplates them aright to the highest and most profound considerations that can occupy the mind of man, (loud cheering.) The science of physiology must become the study of your whole life; every practitioner of medicine is necessarily a physiologist, that is, one who reasons and discourses upon the phenomena of nature; and since this science embraces a range so wide, your attention must be early devoted to it, and no opportunity should be neglected for acquiring a method of prosecuting physiological studies. The ultimate source of our knowledge of nature and its laws is experience,—by which is meant, not the experience of one man only, or of one generation, but the accumulated experience of all mankind, in all ages, registered in books or recorded in traditions. But experience may be acquired in two ways; either, first, by noticing facts as they occur, without any attempt to influence the frequency of their occurrence, or to vary the circumstances under which they occur: this is observation; or, secondly, by putting in extra causes and agents over which we have control, and purposely varying their combinations, and noticing what effects take place: this is experiment.” After some general observations on the necessity of close, careful, and methodical observation to be obtained at the bedside, the lecturer thus proceeded,—“All that you are now learning will become of essential importance and utility to you in after life. It is an opportunity of acquiring just that practical knowledge which you will most require; and I have no hesitation in adding, that all those gentlemen who have left this hospital the most highly-informed and the most competent to practise have been those who spent the largest proportion of their time in the acquisition of medical knowledge at the bedside, (applause.) You must not, however, forget that the investigation of morbid action is to be prosecuted in a place to which we have not yet introduced you. We have only as yet spoken of disease as witnessed during life; but when the vital flame is extinguished, there is a moment when the effects of disease upon the animal organs may be examined with the most valuable results. Gentlemen, if it be necessary to urge any of you to prosecute this study with diligence and activity, I might perhaps induce you to do so by pointing out the distinguished professional and social position occupied by some of those who have most diligently cultivated pathological anatomy. I would mention the names of Sir Astley Cooper, Dr. Bright, and Dr. Addison of your own school, (three rounds of applause followed the utterance of the last name,) those of Sir Benjamin Brodie, Mr. Paget, and there are many others to whom medical science is indebted for original research and important discoveries, (renewed cheering.) There are, gentlemen, I believe, few subjects so conducive to the pleasure and happiness of life as the study of nature and her laws, and this, I have already said, is the constant pursuit of the practitioner of medicine. It has been already observed that ‘science is the knowledge of many, orderly and methodically arranged, so as to become obtainable by one,’ and doubtless many of you will be anxious to add to the stores already accumulated. Indeed this would almost appear to be a duty which the members of a liberal profession owe to each other. Before you do this, however, the habit of prosecuting inquiries of this nature must be diligently enforced. In the observation of facts and in collecting instances much caution and care are demanded. It is necessary that you should follow some regular system, and especially in the record of the natural history of diseases you must collect the facts of every case according to a definite arrangement, if the cases are to be finally compared one with another, in order to arrive at the due appreciation of one fact over another, or to pursue a process of generalization. I would, however, here remark, that the statistical knowledge derived from a comparison of a large number of cases is important in adding to our knowledge of the natural history of any class of disease, rather than as affording any accurate guide in the medical treatment of any individual case. In the treatment of any individual case, the facts of that case, singly and alone, should be first clearly sought for and established, and then the science which has been acquired by experience in the treatment of many cases possessing like general characters becomes available in the practical treatment of the

case immediately under observation. Blindly, and without due regard to the peculiarities of each case, to follow out any particular line of medical treatment in certain classes of cases, having near affinities to each other, because a certain number of cases have recovered under the adoption of one mode of treatment, is to pursue a line of practice closely bordering on the worst form of empiricism, and one which cannot be supported by any rule of scientific inquiry. On the other hand, it must be admitted that all our knowledge of the natural history of diseases has been acquired by them, and the absence of all medical science must always keep pace with the accumulation of facts relating thereto. To observe with industry and attention, to record with fidelity and accuracy, to arrange with order and method, and to be guided in our generalisations by facts alone, are the rules which must direct you in the investigation of the phenomena of disease which may fall under your observation. Truth, gentlemen, is the gem you seek; and like all other inestimable possessions, it is only to be discovered by perseverance, grasped by industry, and held with devotion, (cheers.) There seems to be scarcely any study so likely to improve the moral feelings as that of medical science. It is as much an inciter to the highest moral sentiments as it is, at the same time, a sustainer of them. ‘And if there be any other commandment, it is briefly comprehended in this saying—Thou shalt love thy neighbour as thyself.’ The practical evidence of this love is daily afforded by the generous sympathy with which the profession at large devotes itself to the relief of suffering humanity. Even the constant intercourse with pain and misery, instead of dulling the sympathies, only serves to excite to fresh exertions to render that torture more endurable and that misery less appalling. To me it seems that we should be proud indeed of being members of a profession the chief incitement to activity and energy in which is the pleasure afforded by relieving the necessities of our fellow-creatures, for under innumerable circumstances there can be no sordid feelings goading to the action, (cheers.) The wide range of scientific inquiry involved in the study of medicine enables the student to indulge in those delightful recreations which result from the contemplation of nature and her works, (cheers.) And this is, in fact, one of the great sources of delight which the study of natural science imparts to its votaries. A mind which has once imbibed a taste for scientific inquiry, and has learnt the habit of applying its principles readily to the cases which occur, has within itself an inexhaustible source of pure and exciting contemplations. One would think that Shakspeare had such a mind in view when he describes a contemplative man as finding

‘————— Tongues in trees,  
Books in the running brooks,  
Sermons in stones, and good in everything.’

Accustomed to trace the operation of general causes, and the exemplification of general laws in circumstances where the un-informed and uninquiring eye perceives neither novelty nor beauty, he walks in the midst of wonders; every object which falls in his way elucidates some principle, affords some instruction, and impresses him with a sense of harmony and order. Nor is it mere passive pleasure which is thus communicated; a thousand questions are continually arising in his mind, a thousand subjects of inquiry presenting themselves, which keep his faculties in constant exercise, and his thoughts perpetually on the wing, so that lassitude is excluded from his life, and that craving after artificial excitement and dissipation of mind which leads so many into frivolous, unworthy, and destructive pursuits, is altogether eradicated from his bosom, (cheers.) Many of you are here, in London, for the first time, and perhaps also this is the first time you have been left alone, and uncontrolled, to seek amusements and companions. The influence of the study of the science to which you have devoted your lives will, in all probability, guide many of you to select as amusements some one or other of the sister sciences, or branches of natural history, the arts, or literature, and some resource of this kind is absolutely necessary to revive the drooping spirits after fatiguing exertion in medical practice. Whatever your amusements may be, however, never forget that you are members of a body, in which the ill conduct of one has, more or less, an influence with the public in the estimation of the whole class, and that it is much more difficult to eradicate an evil habit when once firmly established, than to withstand temptation when prepared to meet it, and to be proof against the seductive allurements of folly and vice, (loud cheers.) As regards the selection of companions, this is a matter in which great circumspection is required, for my experience has led me to observe that by far the majority of those young men who have diverged from the right path have been led away and entrapped by an artful and designing companion, rather than by any innate in-

stigation to folly on their own part. If you at once determine to take science as your lamp, to be guided by the light she will afford, you need not fear the dark and treacherous path along which vice would conduct you, nor the call of him who would allure you from her fair companionship; but you may be induced hereafter to exclaim, 'In my youth, and through the prime of manhood, I never entered London without feelings of pleasure and hope. It was to me as the grand theatre of intellectual activity—the field of every species of enterprise and exertion—the metropolis of the world of business, thought, and action. There I was sure to find the friends and companions of my youth, to hear the voice of encouragement and praise. There society of the most refined kind offered daily its banquets to the mind, with such variety that satiety had no place in them, and new objects of interest and ambition were constantly exciting attention either in politics, literature, or science.'

The lecture was frequently interrupted by loud applause, and the conclusion marked by general cheering.

### KING'S COLLEGE HOSPITAL.

#### DR. ROYLE'S INTRODUCTORY ADDRESS.

THE introductory discourse was delivered by Dr. ROYLE, the Professor of *Materia Medica*. The audience was not so numerous as on former occasions, but most of the lecturer's colleagues were present. The former began by stating that, exactly nine years before, he had performed the same task as that on which he was now entering; and he felt great difficulty in selecting a subject for his discourse, as most of the topics which would naturally be brought forward on such an occasion had been repeatedly and eloquently treated in the same lecture-room.

One subject, however, possessed just now the interest of novelty, namely—the hospital, which had just been constructed on a large and liberal scale for the reception of the suffering poor, and where the pupils of King's College could worthily prosecute their medical studies. The lecturer then entered into some details respecting the improved plan upon which the hospital had been erected, and showed that no pains or expense had been spared to render it adequate to its objects. Dr. Royle then took a survey of the various branches of learning of which medical education is composed, and dwelt rather largely on the historical bearing of the subject, especially as regards the early efforts made by the Hindoos in promoting medical knowledge. The pupils present were earnestly entreated to devote their time sedulously to the studies upon which they were entering, to cultivate their intellectual powers; and, as an incentive to zeal and exertion, the lecturer cited the names of several students of King's College who had lately obtained, through merit, assistant-surgeons in the East India Service.

### LONDON HOSPITAL.

#### INTRODUCTORY LECTURE BY DR. LITTLE.

THE new Medical College of this Institution was inaugurated, and the autumnal session opened, with an interesting oration by Dr. LITTLE.

After an able and rapid history of medical teaching, and the means of its cultivation amongst the various peoples of the world from the remotest antiquity down to the present time, the lecturer vindicated the claims of his alma mater as the first, the original, medical school of this metropolis. "The London Hospital," said he, "has the merit of having first set the example, A.D. 1785, of a complete medical school in connexion with a hospital upon the model of the medical faculty of an university, but independent of an university. A similar train of circumstances, no doubt, and the force of example, afterwards led to the formation of complete medical schools at other metropolitan hospitals.

"The printed prospectus of the London Hospital Medical School for the year 1792, is on the table before me. It shows that lectures on all the subjects before mentioned were there delivered, and that a course of lectures on Clinical Medicine was at that time given in this school. Clinical lectures were subsequently discontinued until successfully revived in 1823, by Dr. Billing. I am particular in referring with precision to these dates because a priority of date as a medical school has been erroneously claimed for St. Bartholomew's.

"In one sense only is this claim of St. Bartholomew's correct, viz., its *students*, having been mentioned in 1662; but the attendance of students upon the practice of the surgeons and

physicians does not constitute a medical school, in the modern and full acceptance of the term. We understand by a complete medical school an institution where the several courses of medical lectures usual at an university, or required by the examining bodies, are delivered. In the present case the palm of priority belongs of right to the London Hospital."

Dr. Little here quoted the language of "An Address to the Friends of the London Hospital," published in 1783, to the effect "that a hospital depending on public favour should be able to make every possible plea of public utility," and that "if public lectures on the various branches of medicine are delivered at the hospital its reputation will be raised and its fame extended," and further, "the giving of public lectures at the hospital will conduce to the good of the patients and to the interests of the charity, and the greater number of gentlemen who will receive their education at the hospital, and who from that circumstance will have formed an attachment to it, may be a means of greatly promoting its interests. This effect has already been experienced from gentlemen formerly educated at the hospital, through whom a considerable number of governors have been added to the charity."

"So far the language of the address," said Dr. Little; "and in passing let me express the earnest hope that the students of the London Hospital will never neglect any opportunity they may in after life possess of legitimately influencing the benevolent members of society within their several circles on behalf of the funds of their alma mater, remembering in relation to even the smallest aids, that 'sands make the mountain, moments make the year.'"

The lecturer concluded his remarks with the following earnest admonition:—

"I would advise every man proposing to enter on the study of medicine with a view to following it as a profession, to consider well whether he is prepared to make the necessary abnegation of the hope to realize the one great stimulus to the world's exertion—*opulence*. Competence he may attain, but wealth rarely, if ever! He must often see his path overshadowed by the lofty rank or substantial emoluments of other professions. In a few years, after engaging in practice in our thriving commercial emporiums, the medical man may often see the companions of his youth, by the exercise of no greater industry, ability, and self-denial than he has himself evinced, raised by successful exertion in the field of commerce to commanding positions in society, and in the possession of riches and luxuries which he can never hope for, even if he could enjoy them. And if after quitting these halls you should fail to keep alive the ardent love of philosophical medical research, and should degenerate into the mere '*Bread-learned*' practitioner, the sight of such contrasts cannot but embitter your lot.

"It would be quite beyond my province to exhort you on higher grounds to take a juster and loftier view of your position, to ask you to suppress in your hearts the odious sentiment whether of jealousy towards your actual competitors in practice who may appear more fortunate than yourselves, or of envy towards those who in the ordinary careers of professional, commercial, or official pursuit; but it is strictly within my province to urge upon you my own heart-felt conviction that your profession can amply compensate you not only for the time and labour that you devote to its acquisition, but even for the privations from which it is inseparable.

"In proportion to the zeal with which you follow it will you reap its rewards, amongst which are the happiness of relieving the afflictions of others—the inexhaustible mental treasures furnished by the tributary sciences—the esteem of the public—the love of many, many friends, and the approbation of your fellow-practitioners. And these are rewards, less brilliant perhaps, but nobler and far more precious, than any other profession in the whole scheme of social existence has to offer."

As usual at this hospital, there was a numerous gathering of practitioners as well as students. The new theatre was crowded to excess, and Dr. Little was greeted throughout with animated and cordial applause, which was enthusiastically reiterated as he concluded his address.

### ST. MARY'S HOSPITAL.

#### INTRODUCTORY LECTURE BY DR. ALDERSON.

ON Monday, Dr. ALDERSON, F.R.S., delivered the inaugural address of the Medical Collegiate Establishment attached to the hospital, of which we give the following extracts:—

He opened the address by some remarks on the analogy between the feelings of men when making the first step in any

fresh course of duty, and those which accompany their first entrance upon life and action; that a new future, new powers, and new opportunities for service in their generation, renovate the elasticity of earlier vigour. He stated that his colleagues had already acted vigorously, and had surmounted serious obstacles, resulting in the complete organisation of the school, and in the erection of a noble building, replete with the most perfect accommodation both for lecturers and pupils in the prosecution of medical study and all the collateral sciences. He adverted to the commencement of clinical lectures in the theatre of the hospital, which two years before had been the initiatory step to the present complete school; and, having glanced at hindrances which had required the utmost energy to surmount, dwelt on the sources of encouragement which promise a successful career, and which justified the conviction that the new institution would be calculated to exercise an elevating influence on the medical profession—that it will help to enlarge the general scale of acquirements, to raise the standard of morality, and refine the manners of the younger members, and so lay the foundation for obtaining the world's increased respect, and for establishing a still more honourable position for our profession in the social scale, giving it thereby a wider influence, to be exercised for philanthropic purposes. He looked to the collegiate form of the establishment as a chief means for procuring these advantages, and alluded to the completion of a building or hall for the residence of students as likely to be shortly effected. The supervision of a principal would then have a beneficial influence both on the character and habits of the students.

Dr. Alderson bore testimony to the high qualifications of his colleagues for the work of instruction, forming a body in whom no feature of professional eminence is wanting; and alluded to the experience and success in teaching already gained by most of them, especially noting Mr. Lane's ability as a lecturer, and the advantage which would be derived from his experience in all the arrangements necessary for the prosecution of the study of practical anatomy. He announced that a chair for military surgery had been added to the usual courses, to be accompanied by practical demonstrations; and congratulated the school that, even in its incipient form, it had furnished no less than three assistant-surgeons to the regiments of Guards. He enlarged on the necessity of this branch of medical education, which had already been brought under consideration by Mr. Guthrie's able and most valuable exertions. He insisted also, at some length, on the necessity of enlarging the course of forensic medicine, so as to place the rising generation of practitioners in a firmer position when they are obliged to give evidence in the courts of law.

Dr. Alderson then alluded to the local advantages of St. Mary's, situated in a district which combines a large pauper population on the one side, and multiplying habitations of the wealthy on the other. The elevation of the ground and the nature of the soil making it an unusually desirable residence for young men while going through the trying ordeal of a course of education, part of which cannot by its nature fail to be depressing to the vital powers. In these respects of local advantages, St. Mary's is pre-eminently favoured above all the more ancient schools of the metropolis. He then very briefly reviewed the present state of medical inquiry, and from thence impressed upon the students that institutions for medical education were intended more for the acquisition of solid elementary knowledge than for scientific speculation. He recommended the cultivation of every possible accessory to the accumulation of facts in investigating natural phenomena; and mentioned photography as new in its application to medical science, and far from trivial as a means of collecting examples and bringing them together for mutual illustration, seizing thereby the living physiognomy of disease, and fixing its most fleeting characters. He also alluded to meteorology as a subject on which facts have yet to be accumulated, and one on which the scientific labours of the rising generation are likely to be especially engaged, with a hope that a revelation of the laws which govern the changes on the human body will result from it. On the subject of the professorial and tutorial modes of teaching the lecturer expressed himself strongly on the superior advantages of the tutorial, and regretted that the custom of multiplying lectures was obtaining ground in the older universities. In the professorial method, he said, the teacher alone is active, the listener merely passive. The intellectual power of the student may not be even roused to action, and he may leave the lecture-room with mind as vacant as he entered it. In the tutorial, on the other hand, the teacher supplies the information, and then requires that each student should demonstrate that he has realized it, making him an active agent, not a passive recipient of the work. He an-

nounced his intention to cultivate the form of tutorial instruction at St. Mary's, as far as opportunities would allow. He then spoke of the responsibilities attached to the work which he and his colleagues were beginning. It is, he said, a significant reflection that, according to the efficient or deficient performance of our work, men who are in future to be intrusted with the care of other's lives, and whose conduct may influence a vast amount of domestic happiness, will be sent into the world capable or incapable of meeting the duties of their important calling. It is true that before they can assume their responsible position the law requires that it shall be ascertained that they have acquired a certain amount of knowledge, but no examination can test the height of mental culture they ought to have reached, still less can it try the fitness of the character for their intended course of life. Examinations are the letter of the law of preparation, the spirit to animate that law and elevate the standard of acquirements rests with us. It is one thing to obtain sufficient knowledge to sustain examination, another to grasp a philosophic view of the principles of medical science, and to have laid a sure foundation for all subsequent research; and even were it possible to test the existence of these higher qualifications, still no examinations can approach those moral requisites, that serious sense of responsibilities to be assumed, that love of duty for conscience-sake; that foundation, in short, of the especial virtues—industry, temperance, charity, unselfishness, forbearance—which will be needful in the future course. If all these qualifications are not perfected, they should at least be cultivated; and according to the manner in which they may fall short we shall have failed in the work intrusted to us. "And from our own responsibilities I may now turn," said the lecturer "to those which peculiarly attach to this new School of St. Mary's, precursors, as we hope, of a numerous band, who will hereafter adorn their profession, and do good to society. Their position has its special duties, arising from that peculiar influence which attaches to a good or bad beginning; their progress in knowledge may form the standard of acquirements; their tone of morality and manners may become the type of character for many a succeeding set of students. It is an inspiring motive to their high exertion to know that their individual success may stamp the reputation of the institution; that their influence and example may make hundreds of successors wiser and better men. And let us, therefore, all, teachers as well as learners, not forget the grave responsibilities we now assume whilst, with cheering hope, we set about our duties."

## MIDDLESEX HOSPITAL.

### DISTRIBUTION OF PRIZES, ETC.

At the opening of this School, the students assembled in the theatre at eight o'clock in the evening, when several of the professors each briefly addressed their auditory, and introduced the pupils of their own peculiar class to whom the prizes and certificates of the past session had been awarded. All these gentlemen spoke in eulogistic terms of the attention and regularity of conduct observed by the students generally, and amongst other exhortations, the pupils were reminded that the time devoted to the study of medical science was disproportionately small for the magnitude of the subject, while it was to be regretted that the College of Surgeons had now dispensed with one year of hospital practice. They were enjoined to remember that, while the most rigid application to the course of study was requisite to insure success, yet it had been observed that, in nearly all the rejections on examination before the Hall, the failure could be attributed to either indolence or the seductions of society; and on the principle of Mr. John Hullah, that every one could be taught to sing, and of Mr. Butler Williams, that every one might be made a draughtsman, so the difficulties of the medical profession might be mastered by a sufficient determination and even average capabilities.

Mr. William Hawes, who took the chair and distributed the prizes, alluded, in a conclusive address, to that office having been previously performed by Lord Carlisle, the Bishop of Oxford, and Sir Robert Inglis, and trusted that the value of the memorials awarded would not be depreciated on the present occasion by being presented through less distinguished hands. He recalled to mind the depressed condition of this School in 1847 and 1848, when it was attended by only ten or a dozen pupils, and his gratification at its improvement now, when they could number between ninety and one hundred. On a vote of thanks being proposed, and unanimously responded to, it was remarked by the gentleman who proposed it, that this change for the better he (Mr. Hawes) had been mainly instrumental in bringing about.

## WESTMINSTER HOSPITAL.

## MR. BARNARD HOLT'S INTRODUCTORY ADDRESS.

THE medical officers of this institution have been untiring in their efforts to make the means of instruction which this hospital (the eldest sister of all the subscription charities in Great Britain) affords equal to the advantages furnished by other establishments.

The customary anniversary address was delivered by Mr. BARNARD HOLT, F.R.C.S., Senior Surgeon and Lecturer on Clinical Surgery to the Hospital, to a numerous *clientelle* of pupils and friends. The lecturer truly observed there must be a great sameness in all these addresses; it is necessary to recommend the same great moral principles, love of truth, active benevolence, untiring industry, and a desire for the acquisition of knowledge, which form the basis of professional excellence. Professional excellence Mr. Holt considers to depend upon personal excellence; the best man makes the best practitioner. "The most important and the unceasing task of the medical man ought to be self-culture, to study yourselves, to learn the possible excellences of your own nature, and by study and reflection to develop them." The lecturer earnestly impressed on his auditory the necessity of manly virtues and social sympathies as the substratum of the medical character. "In this highly-civilized and religious community," he proceeded, "every one that has the slightest tincture of education has imbibed notions, more or less distinct, of his moral duties, probably some taste for literature, and perhaps some feeling for art; but these acquirements go but a little way towards the accomplishment of that moral and intellectual culture which has won for the profession its present social elevation. Even the fortunate possessor of the most comprehensive preliminary education will find that he has very much to effectuate by his own efforts at self-cultivation. There is an education desired from self-discipline and reflection which no school or college can bestow. By habitual efforts at improvement, the less-favoured student soon neutralizes these adventitious advantages, and stands with equal chances on the race-course of fortune. The more disciplined the mind of the medical practitioner, the more his intellect is sharpened by rationalistic exercises, the more his moral perceptions are developed by a vigilant conscientiousness, the more his nature is softened by an indulgence in æsthetic pleasures, so much the more efficient will he be in the practice of his art; the greater will be his perspicuity in discriminating nice shades of disease, the richer will be his invention of remedies, the more persevering his zeal for the welfare of his patient, and, above all, the more liberal and just will his bearing be towards his professional brethren, whom his enlightened understanding will have taught him to regard, not as rivals, but as colleagues and allies, in the great crusade against pain, disease, and death." Regarding still the general education of the practitioner, Mr. Holt drew a humiliating picture of the ignorant and neglected mind, and pointed out the three chief sources of improvement as available to the zealous student,—reading, conversation, and reflection. He demonstrated with perfect truth and considerable humour the difference between methodized reading and the desultory perusal of books, and inculcated some excellent maxims for the guidance of the student in this practice. The value of conversation depends on the companions chosen, as much as the temper and conduct of the student. The best-instructed are the best companions, but there is room for skill in extracting knowledge. To question rightly, implies acuteness of mind and agreeable manners; questions are not to be put in a captious and Socratic manner, but in a way indicating modesty and a real desire to be instructed. The successful use of the two sources of reading and conversation implies the unceasing exercise of thought and reflection. "Contemplation," proceeded the speaker, "is the peculiar attribute of man, who alone dives into the causes of things; without it, memory and observation are useless. It alone arranges facts into systems, as the architect classifies his materials, and reduces into harmony and order the discordant and confused. What is acquired either by the tutoring of others, or by our own observation, must be digested in the alembic of thought before it is reduced and converted into our own intellectual property." Contracting his view to proper professional subjects, the lecturer applied the principles already indicated as necessary to the acquisition of general knowledge, to the subjects of medical study. He reviewed the several sciences subservient to the purposes of the healing art, and illustrated by well-chosen examples the applicability of chemistry, botany, *materia medica*, and natural philosophy, generally, to various purposes of diagnosis, prognosis, and treatment of diseases, as well as in assisting the administration of justice in the shape of what is called "medical jurispru-

dence." The lecturer enlarged on the great science of physiology: "Wide and comprehensive, including the whole doctrine of life, and levying tribute either by direct application of principles, or by analogical inferences, from experimental philosophy and all the natural sciences, physiology is the great reservoir from which the several conduits of the various departments of the healing art are derived; it deals with facts of a transient and subtle nature, and demands for its mastery the energetic exercise of the attention and reason. A knowledge of its principles is indispensable, not merely to the physician and surgeon, but to the general practitioner, and to the healer of special diseases."

The lecturer also exhorted the student to a close attention to descriptive and relative anatomy, as well as to pathology in all its respects, particularly alluding to the ingenious views lately propounded by Dr. Radcliffe. He enumerated the opportunities which the school and the hospital afforded for the acquisition of knowledge and practical skill in all branches of the art. Medicine, surgery, midwifery, ophthalmic surgery, military surgery, aurral and dental surgery, all occupied a due degree of attention and care: instruction in all these subjects was communicated in clinical and systematic lectures. Opportunities for obtaining manual dexterity in all departments, were afforded by the occurrence of numerous cases. Dr. Bird's "Maternity Charity," and Mr. Guthrie's Ophthalmic Hospital, were both open gratuitously to the students of the Westminster Hospital.

Mr. Holt concluded an animated address amidst much applause, reiterating in an impressive manner his exhortations to the student, to establish his professional accomplishments on a broad basis of general excellence. The evening concluded with an agreeable "conversazione," at which microscopic and other objects of interest were displayed.

## UNIVERSITY COLLEGE.

## INTRODUCTORY LECTURE BY DR. CARPENTER.

DR. CARPENTER delivered the lecture here, to between two and three hundred auditors. At this School, the plan adopted has frequently been, disdainful of common things, to strike out of the more beaten track of opening addresses, for the sake of taking up some special subject, occupying for the time being the mind of the lecturer himself. Thus, we have heard in the same place, an introductory lecture consisting of arguments to show why pathological phenomena could not be predicated from a knowledge of physiology; and at another time, an address full of mathematical disquisitions—matters interesting enough to the more advanced in science, but scarcely fitted for the young student, the first year's man, for whom, we suppose, addresses at the commencement of the session are chiefly useful, and who palpitates with hope and eagerness to be presented with words of encouragement and counsel how best to pursue his studies. On the present occasion, the lecturer, after enumerating the various styles which might be adopted for introductory addresses, chose for his subject, the relation between cause and effect. He illustrated his views by many apt examples, drawn from both art and nature, inorganic and organic. In particular, he impressed upon his audience, that they must not consider the cause as the immediate antecedent of any effect; that the cause of an effect was compounded of several conditions, all of which must be taken into account; and that confusion had arisen from separating too widely predisposing and exciting causes, as these might change places and designations under different circumstances. The subjects of fermentation and zymotic diseases came in for a share of attention, and Dr. Carpenter gave his views on the nature of cholera; this disease he considered to be caused by a specific poison entering the blood, which was prevented from being eliminated by whatever impeded the great depurative functions of respiration, &c., amongst which sources of evil he classed the use of alcoholic liquors. He stated it as his opinion that an individual furnished with proper food and drink, respiring adequately, and unaffected by circumstances calculated to depress the general health and to cause the effete products which ought to be eliminated to be retained in the system, as by no means liable to an attack of choleraic disease. The Doctor's peroration we consider to have been the best portion of his lecture.

A large proportion of the audience consisted of young men; whether they were fresh students there we cannot say, but at the termination of the lecture there seemed to be little recognition between the professors and those on the benches behind them,—few hearty greetings such as might be expected between old friends, or teacher and pupil; although several of the professors had been applauded as they had entered the theatre.

# ON THE TREATMENT OF CHOLERA BY CASTOR OIL.

BY EDWARD J. COMPLIN, Esq.,

RESIDENT MEDICAL OFFICER TO THE "DREADNOUGHT" HOSPITAL SHIP.

In consequence of the very strong manner in which castor oil has been recommended by Dr. Johnson, in the treatment of Asiatic cholera, the physicians to the *Dreadnought* hospital ship considered it their duty, both in justice to Dr. Johnson, and also to their patients, to give the reputed remedy a fair trial in a series of cases. They were not selected, but taken

indiscriminately for several days together. Immediately on admission each patient had a salt and water emetic administered, in order to clear the stomach of any medicines or other liquid that might previously have been taken. After copious vomiting had taken place the castor oil was begun. The medicine was given regularly, under my own superintendence, and I can conscientiously assert, that in no case was there any neglect or mismanagement on the part of the nurses. Constant friction to the extremities, by means of flesh brushes or coarse towels, was also employed, and an abundant supply of iced water was given to all of them. The following is a brief but correct account of the cases thus treated:—

No.	NAME.	Age.	Country.	Date of Admission.	State on Admission.	Dose given.	No. of Doses Taken.	No. of Doses Vomited.	RESULT.
1	Antonio Hamalt	18	Dane	Sept. 2nd, 10 A.M.	Collapse extreme	Half an ounce of castor oil every half hour	9	None	Died collapsed, five hours and a half after admission.
2	Peter Neuhans	15	Dutchman	Sept. 2nd, 11 A.M.	Collapse slight	Ditto	46	None	Had consecutive fever slightly, but recovered.
3	William Hill	26	Englishman	Sept. 2nd, 11 A.M.	Collapse great	Ditto	21	None	Had such intense reaction as to require a full bleeding. Recovered.
4	Martin Casperan	22	Dutchman	Sept. 10th, 10 A.M.	Collapse great	Ditto	48	17	Died of consecutive fever four days after admission.
5	Thomas Wright	16	Englishman	Sept. 10th, 1 P.M.	Collapse great	Ditto	28	6	Died collapsed fourteen hours and a half after admission.
6	John Britten	38	Englishman	Sept. 10th, 1 P.M.	Collapse great	Ditto	70	27	Died collapsed three days after admission.
*7	Watson Eberg	16	Englishman	Sept. 10th, 2 P.M.	Collapse slight	Ditto	48	6	Had slight consecutive fever, but recovered.
8	Joseph Zerney	27	Austrian	Sept. 11th, 7 A.M.	Collapse extreme	Ditto	24	None	Died collapsed, thirteen hours after admission.
*9	Andrew Santig	27	Austrian	Sept. 11th, 10 A.M.	Collapse slight	Ditto	72	12	Died of consecutive fever four days and a half after admission.
10	Joseph Groom	18	Englishman	Sept. 11th, 1 P.M.	Collapse extreme	Ditto	8	None	Died collapsed seven hours after admission.
11	Edward M'Obin	19	Englishman	Sept. 11th, 1 P.M.	Collapse slight	Ditto	76	13	Recovered without any consecutive fever.
12	George Lewis	22	Englishman	Sept. 11th, 2 1/2 P.M.	Collapse slight	Ditto	9	1	Died of consecutive fever four days after admission.
13	Merincovich	26	Austrian	Sept. 11th, 4 P.M.	Collapse great	Ditto	67	6	Recovered without any consecutive fever.
*14	Laurence Musan	25	Austrian	Sept. 11th, 6 1/4 P.M.	Collapse great	Ditto	60	10	Died collapsed two days after admission.
15	Chris. Golischen	28	Norwegian	Sept. 12th, 6 A.M.	Collapse great	Ditto	29	13	Died collapsed seventeen hours after admission.
16	Carl Branen	26	Norwegian	Sept. 12th, 9 A.M.	Collapse slight	Ditto	49	13	Died of the consecutive fever six days after admission.
17	Valentin Cartuich	26	Austrian	Sept. 12th, 9 A.M.	Collapse great	Ditto	24	None	Died collapsed eighteen hours after admission.
*18	William M'Muller	19	American	Sept. 12th, 11 A.M.	Collapse slight	Ditto	43	13	Had slight consecutive fever, but recovered.
19	John Cooper	18	Englishman	Sept. 13th, 3 P.M.	Collapse slight	Ditto	34	19	Recovered without any consecutive fever.

Thus, out of nineteen cases, twelve terminated fatally, and seven recovered.

Of the twelve fatal cases, eight died during the stage of collapse, and four of the consecutive fever.

Case No. 16 was but a slight case of collapse, but became afterwards the worst case of consecutive fever we have had to treat.

Of the seven that recovered, in one the reaction was so great as to require a full bleeding, three had the consecutive fever slightly, and three recovered without any febrile symptoms.

In the four cases marked with a star, calomel was given, after the oil appeared to have produced no beneficial effect, and the patients were getting worse.

Of the four cases thus treated, two recovered, two died. The two that recovered had consecutive fever slightly, the third died of consecutive fever, and the fourth died during the stage of collapse.

Judging from the result, I think we are not justified in giving any credit to castor oil in Asiatic cholera.

September, 1864.

## Reviews and Notices of Books.

*The Diseases of the Fetus in Utero, (not including Malformations,) with an Outline of Fetal Development.* By HENRY MADGE, M.D., M.R.C.S., &c. Fcp. 8vo, pp. 200. London: Renshaw. 1854.

A WORK devoted to the elucidation of so novel a theme as the diseases of the fetus in utero demands more considerate treatment at the hands of the reviewer than the majority of publications which are submitted to his notice, since, as far as we know, it forms the first attempt which has been made in this country to bring together in one volume all that is known on the subject. Not, however, that it is necessary to make much allowance, seeing that the author has not only produced a useful volume, but has also done good service by simply drawing attention to the matter. It is certainly much to be regretted that medical men, as a rule, neglect to avail themselves of the numerous opportunities which they must so frequently have presented to them of investigating more closely the diseases of the fetus, especially so far as such diseases are the causes of abortions, miscarriages, or premature labours. Simpson and Graetzer have attempted to account for this indifference by the difficulties which surround the diagnosis of foetal diseases; but they add that, if it is impossible to become acquainted with the actual condition of the fetus in utero, or the effect of medicines upon it, by post-mortem examinations of the still-born, yet we are often made aware of latent disease in the parents which would otherwise have been unsuspected, and thus a new path of therapeutical investigation may be opened. The reproach that we are deterred from a duty by the difficulties we are likely to encounter must not be allowed to remain; and, as Dr. Madge proves that the impossibilities alluded to by Graetzer are feasible possibilities, we shall have no excuse for future idleness.

After a preface and an interesting introductory chapter, our author proceeds to the consideration of the proper subject-matter of his essay, which he divides into two portions,—part the first being devoted to a *résumé* of the development of the fetus, the plan and some of the materials of this division being taken from the article “Œuf,” by Ollivier, in the “Dictionnaire de Médecine;” while, in the second section, the chief foetal diseases are reviewed, much of this part being made up of translations from those authors who have paid particular attention to the subject, and the views of Mauriceau, Dubois, Depaul, Ricord, Goodair, Simpson, and others, being especially canvassed. As an example of Dr. Madge's method of treating his subject, we may quote the following passage from his concluding remarks:—

“So long as obscurities surround the subject of foetal nutrition and development, we can hardly hope properly to understand foetal diseases. Correct pathology must be preceded by correct physiology. It is true we are able to arrive at pretty correct general views on each; but if we wish to follow the complex operations of the foetal economy very narrowly, there is yet a great deal to be done. We know that the fetus is supplied with nourishment from the maternal fluids, and that through the same channel it may become diseased, or receive a check to its healthy development. If, however, we desire to interrogate nature as to all the agencies by which these are effected, we must be prepared to enter an unexplored region, full of interest and difficulties.”—p. 193.

It only remains for us to recommend Dr. Madge's work to the attentive perusal of our readers, since it contains much valuable and interesting matter.

*On the Triple Aspect of Chronic Disease; having especial reference to the Treatment of Intractable Disorders chiefly affecting the Nervous and Muscular System.* By WILLIAM BAYES, M.D., &c. &c. London. 1854. pp. 56.

WE are sorry to find a physician of the Brighton Dispensary having both time and inclination to write such quackish nonsense as he has here placed before us. The first quotation represents his anatomy and physiology, the second his patho-

logy and practice, and the third demonstrates the very sorry purpose of which Dr. Bayes makes assumed religious feelings the media:—

1. “Some [bones] are seen dovetailed and rabbeted almost immovably into each other, forming arches, chambers, and basins; others are so arranged as to allow the semi-rotatory motion of the socket-joint; some, like hinges, move freely in two directions, while others partake of both movements. . . . The living arch of the diaphragm covers the various intestinal organs as with a cupola, while it forms the floor of the yet more worthy chamber above—the camera vite, the hall of animal life, the dwelling-place of the blood, with its heart and lungs. . . . And lastly, as the air is above the earth, &c., so the soul envelops and penetrates his body.”—pp. 1 and 15.

2. “There is a first step always to be taken before we can commence our course, of more direct remedial means. This preliminary treatment consists in a thorough purgation and purification of the whole man; not a mere vulgar purge through the bowels, but a casting out and washing away of mental prejudices, as well as of accumulated debris of nerve, muscle, and bone, which have lain long, impeding healthy function. . . . Thus, phoenix-like, man may arise from the invalid, his whole unhealth destroyed in the combustion of his lethal envelop. This is physical regeneration.”—p. 27.

3. “Unless this first step be taken, the attainment of perfect health is impossible. . . . it is the expression of the highest and holiest aspiration after health, and has faith for its foundation. The very fact of prayer for health argues both faith and fervency of desire, and how fully can the true and trustful christian appreciate the healthful aura which accompanies the soothing and satisfying communion with his God.”—p. 29.

This is the first trumpet to blow the quackery of kinesipathy (for it is this which Dr. Bayes advises) and bring patients to the old Steine at Brighton. We trust it will be followed by no other.

*Medical Formulæ:* Reprinted from the “Manual of the Practice of Medicine.” By T. H. TANNER, M.D., Licentiate of the Royal College of Physicians, Physician to the Hospital for Women, &c. London. Renshaw. 1854.

DR. TANNER's “Manual of the Practice of Medicine” having had a large sale, and having been highly praised by reviewers and purchasers, Mr. Renshaw has been induced, in the hope we suppose of increasing his profits, to re-publish the Formulæ separately, and accordingly we have a compact little volume, which must prove useful to most practitioners. Having only very lately reviewed the Manual itself, it is unnecessary to say more, than that the several prescriptions are quite up to the knowledge of the present day; that they are concisely written, though free from barbarous abbreviations; and that when the physician or surgeon is in doubt, he cannot do better than consult Dr. Tanner's Formulæ.

## TREATMENT OF CHOLERA BY SUGAR.

To the Editor of THE LANCET.

SIR,—In the replies to questions addressed to you on the subject of cholera, I meet with the following in THE LANCET of Sept. 16th:—“All experience has hitherto shown that in nearly every instance, if the diarrhoea and vomiting be stopped at the commencement, a cure is effected.” The following is a simple West Indian remedy for checking diarrhoea, and as the ingredients are not nauseous, vomiting, if not allayed, cannot be excited or increased. Its simplicity will no doubt lead many to reject, and others to spurn, it; but a sense of this does not deter me from bringing it under your notice, feeling assured that, if tested in the premonitory stages of cholera, it will be found the safest and most effectual remedy hitherto tried:—Refined lump sugar, two ounces; best olive oil, an ounce, or a sufficient quantity to form a thick syrup: half an ounce to be given every two hours, or more frequently if the purging be violent.

If under similar circumstances, any one had sent me this simple remedy, I should have rejected it as not worthy of notice; but, Sir, I have tested its efficacy in many very severe cases of dysentery, where calomel and opium and the usual astringents had previously failed. I never knew but one instance of failure, and that was in a case of ulcerated bowels.

I am, Sir, your obedient servant,

Marfield, Clonmel, Sept. 1854.

EDWARD MARSHALL.

# THE LANCET.

LONDON: SATURDAY, OCTOBER 7, 1854.

DURING the present week some dozen introductory lectures have inaugurated the openings of the various metropolitan Medical Schools for the session 1854-55. Of all of these abstracts are given in another part of this journal, and as the precepts laid down in them are for the most part exceedingly good, we beg to direct our readers' attention to them. Nevertheless it may be regretted that some of the lecturers seem scarcely to have borne in mind the nature of the audiences they were addressing; and it may be therefore excusable if we briefly show to whom such discourses should be especially directed.

There are three classes particularly likely to be benefited by general remarks introductory to the business of the session. In the first place, such a discourse should be addressed to those young men who, in a strange place, perhaps in a city remote from their homes, surrounded by strange faces, and alarmed by the apparently insuperably difficult studies at which they have to work, need all the encouragement, and feel the value of every helping hand held out to aid them in their first steps, to bid them be of good heart, and to show them that steady, moderate industry, perseverance, and a correct use of their powers of observation, are alone necessary to enable them to overcome all difficulties—to wrestle successfully with all obstacles, and ultimately to become attached to the most useful of all public bodies—the guardians of the health of the people. Who can not conceive the inflexible determination, the high aspirations, the manly resolutions, which were formed by pupils when first sitting upon the lecture-room bench?—how they regarded their future teachers almost in the light of superior beings, guarding those portals of knowledge which were to be opened for their benefit, and how the height of human happiness must consist in belonging to such a body? Happy is it that many of them can look back and see that all their good endeavours were not scattered to the wind, and can feel that they are now reaping the fruit of the seed then so diligently sown!

In the second place, words of admonition and advice are especially adapted, at the commencement of a new session, to those who have already gone through a portion of their studies, and who still need encouragement to plod on, in order to reach with credit that goal which may be just in view. Many of this class require reminding, not only of how much remains to be done, but also how little they have accomplished of what is already to be expected from them. The old proverb of the destination of many good intentions may be not inaptly addressed to those who have been led away from the hospital and dissecting-room by frivolous and empty amusements, and who are better acquainted with the rules of whist or billiards, than with the laws of health and disease. A few timely, well-meaning, and kind words to such may be the means of increasing their industry, and reclaiming them from their follies—follies which would, perhaps, be excusable in youths of their age, were it not for the lamentable consequences that must ensue from a continued practice of them. Any man may be enabled to pass the examinations at the College of Surgeons and Apothecaries' Hall by a few months' grinding or coaching;

but to become a practitioner of Medicine, such as a man of average abilities ought to become with the advantages which are placed before him in the present day, he must literally be content to fulfil the poet's injunction,

"To scorn delights, and live laborious days."

And this leads us to say that, in the third place, remarks may well be addressed, on such an occasion, to those who, having just completed their studies, are about to try and gain the confidence of the public—to endeavour to settle themselves as practitioners of the healing art. Such men stand especially in need of advice, and when it is given by one who has successfully trodden the same path, and overcome the difficulties which beset most beginners, it is indeed valuable. The mere fact, that the practice of Medicine arose from an instinctive impulse to relieve the pains and sufferings of others, is sufficient to show that the physician, of all men, must be free from that vice which is the besetting sin of mankind—selfishness. He must, indeed, be thoroughly contented to live, not for himself, but for others; not to look to his own interests, not to be guided in his actions by motives of policy; but to let the rule of his life be, to do as much good to others as possible. The physician, to be successful, must not only possess a sound practical knowledge of his profession—such a knowledge as can only be acquired by long attendance at the bedside—but he must also be careful that his moral character be free from blemish; that his general conduct be not only above vulgarity, but such as to excite the respect of his friends and neighbours; that he be conscientious, attentive, careful of the secrets of those who consult him, unmindful of the worldly condition of his patients, sympathizing, calm, and circumspect in his behaviour generally. As it is his object to prolong life, so he must leave no means unpursued in order to attain such object, remembering that the mere prescribing of medicines is often the least part of his duty. A man who practises his profession conscientiously will never be unmindful of the duties which he owes to his colleagues—to those treading the same path as himself. He will carefully avoid all such short-sighted proceedings as may tend to elevate himself by depressing others; he will strictly eschew those disgraceful methods of obtaining notoriety, newspaper puffing or prescribing; and he will hesitate at giving, as a rule, gratuitous advice where such is not needed by the circumstances of the patient, and where such a course of proceeding must injure those whose daily bread depends upon their obtaining a fair remuneration for their labours.

Were we not afraid of passing the limits assigned to us, we could easily enlarge upon these points, and especially upon the blame which those men deserve who try to gain a fleeting reputation by daily opening their doors to all who like to seek their services free of expense; such conduct does incalculable mischief to our body. But this is not the time to enter on such subjects; our object is more to show that, practised in a proper spirit, with a high regard to those obligations which are due to the public and the medical profession, the healing art is indeed a noble calling, with rewards and honours for all its followers; and that its duties may be so performed, let each remember the words of HUFELAND:—

"Thine is a high and holy office; see that thou exercise it purely; not for thine own advancement, not for thine own honour, but for the glory of God and the good of our neighbour. Hereafter thou wilt have to give an account of it."

We regret that any writer, sanctioned by a journal possessing such a vast circulation and influence as *The Times*, should have fallen into the mistake of rashly advocating a system of treatment of Cholera, hastily and unwisely propounded, and as hastily received. Surely the past experience of numerous pretended cures for Cholera should have made the writer more cautious. There is a speciousness about the idea of assisting nature to get rid of a poison, that is admirably adapted *ad captandum vulgus*. But in phthisis, is not the expectation an effort to get rid of the *lethal matter*, the tubercle lodged in the lungs? and what physician, in his senses, would think of increasing the discharge in such a case? Under the plea of "assisting nature, such phrases are peculiarly adapted for the popular ear, and we regret that a paper possessed of the immense influence of *The Times* should even appear to endorse them. But when the alleged success of the treatment by castor oil has been thoroughly exposed and refuted officially by the Council of Health, what are we to think of the statement of the writer: "That a mode of treatment which saves three-fourths of the patients to whom it is applied, is far preferable to the old system, which confessedly loses 65 out of 100?" What a monstrous deception! If cases of diarrhoea be taken into account as Cholera, (and all pretenders to cures do take them into account,) hardly one in 200 dies of Cholera. The writer of whose conduct we complain may feel assured that the medical profession is well-disposed and determined to do its duty; but we must remind him that there is such a thing as the calculus of probabilities; and it by no means follows that because out of fifteen cases a certain proportion recovered, the same would hold good of 1500. The treatment of Cholera by castor oil is condemned by the whole of the influential portion of the profession.

### Correspondence.

"*Andi alteram partem.*"

#### CHOLERA IN ST. JAMES'S, WESTMINSTER.

To the Editor of THE LANCET,

SIR,—The extraordinary severity of cholera in the northern portion of St. James's parish, during the recent outbreak, is so universally known, that any additional evidence respecting such an occurrence is superfluous. One person in every fifty-five residents, who were alive and well only a few weeks ago, in the Golden-square and Berwick-street districts, having already fallen victims to this scourge, incontestably proves its great virulence, and a long time must elapse ere the melancholy effects of the pestilence can be, if ever, forgotten. My immediate object, in adverting to this subject, being, however, to mention some collateral circumstances connected with the general health of the inhabitants dwelling in this district during the past month, rather than to discuss cholera specifically, I would now crave permission to state, through your pages, an interesting feature having reference to the particular spot where the malady raged so violently,—that other diseases then prevalent appear to have been less frequent, and also showed a milder type, than during previous parallel seasons. This assertion may, at first sight, seem somewhat bold, but being based upon ample experience, obtained at St. George's and St. James's Dispensary, which is situated in the affected neighbourhood, and from whence many patients labouring under the prevailing complaint were attended by the medical officers, the subjoined statement therefore deserves attention. On examining the registers of this institution, to which numerous sick poor of St. James's parish have been accustomed to resort for medical advice during many years, I find fewer patients were attended by the physicians and surgeons of that charity, in the four weeks ending last Thursday, the 28th of September, than throughout any similar period, also terminating on the same Thursday of every September, during the past ten

years; and this result actually occurred notwithstanding the extensive prevalence of cholera in the immediate vicinity. Compared with the corresponding month of 1853, the late diminution of patients admitted is very curious; but the number is more especially remarkable, if contrasted with the same season of 1852, when the admissions were more than double in amount, 825 cases of all diseases having then come under treatment, whilst 17 died, 5 being by diarrhoea and dysentery; whereas, during the four weeks of the current year, ending last Thursday, only 359 patients of every description applied for assistance, the deaths registered being 15, of which 12 arose from cholera.

The above facts are instructive; and as an analogous diminution in the gross admissions was likewise recorded at the same dispensary, throughout the parallel four weeks of 1849, although cholera also prevailed to an unusual extent, when the total patients treated were 364, or only five more than recently, such coincidences cannot altogether be received as accidental. From these figures it may be reasonably deduced that, however severe the recent pestilence actually proved, other diseases seemed, in this locality, less prevalent and fatal than in former corresponding seasons. In short, cholera and its precursory diarrhoea, like the faded dragon of antiquity, appear to have swallowed up most other maladies, and hence acted, for a time at least, as the chief destroyers. Not only was the aggregate number of patients at the dispensary in King-street considerably diminished, but the type of most complaints, with the exception of cholera, appeared also materially modified. Very few of the usual inflammatory maladies were noticed: debility was the ordinary characteristic of disease, whilst tonic remedies and strengthening treatment became almost invariably requisite. Only three deaths, besides the twelve by cholera, having been reported amongst all the patients treated, of which one was from phthisis, another by convulsions, and the third from pertussis. This clearly indicates the mild form of most diseases recently prevalent, as also the absence of any severe malady, except the prevalent epidemic. Whether results similar to those just detailed were noticed, at other public institutions appropriated for the reception of sick persons, I am unable at present to specify, but hope the information will in due time be obtained by other observers, so that our stock of accurate information regarding the late sanatory condition of the metropolitan population may be augmented, and thus we shall arrive at correct conclusions on the question here mooted. As the data contained in previous paragraphs were derived from the records of an establishment connected with the district where cholera recently proved so remarkably virulent, they consequently possess much value; and if so considered by the profession, I trust this communication will be deemed worthy of perusal by the readers of your widely circulated publication.—I remain, Sir, &c.,

October, 1854.

JOHN WESTER, M.D., F.R.S.,  
Consulting-Physician to St. George's and  
St. James's Dispensary.

#### GALVANISM IN CHOLERA.

To the Editor of THE LANCET.

SIR,—Allow me to call your attention to a treatment of cholera which has of late come under my observation, the results of which are in my opinion sufficiently satisfactory to call for the most speedy and careful investigation. Let me premise, however, that I have always considered the treatment adopted in cholera too exclusively directed to the organs immediately attacked, whereas our present want of knowledge as to the cause and nature of the phenomena of this disease would certainly indicate it to be more prudent merely to allay the irritation of the mucous membranes by simple means, while our principal attention should be directed to keep up the vigour of the whole system, and to preserve as far as possible the normal action of all the other functions. It is certainly true that several of the medicines which have been employed are intended to act less on the mucous membranes than on certain organs supposed to possess an influence over the disease, but the general results have been anything but satisfactory. The difficulty of applying stimulants of the usual description in a disease in which the "digestive functions" are so entirely suspended, had caused me, in common with many of my professional brethren, to give up speculating on this distressing subject, leaving it to those medical men who had greater opportunities of investigating it to suggest a remedy on which more dependence could be placed than on those at present administered. My attention has, however, been again called to the subject by my friend, Mr. Meinig, of Piccadilly, some weeks ago, who assured me that he had seen several persons

cured in a very short time of most virulent diarrhoea and vomiting simply by the application of the "Electro-Generator," of which he is the inventor. One of the poles of the generator was applied to the spine, and the other to the abdomen, thereby keeping up a continuous mild current of electricity through all the intervening parts of the body. He also stated that he had cured himself of a similar attack, using no remedy whatever except the "Generator." I cannot shut my eyes to the great value of continuous currents of electricity in keeping up functional action independent of the "digestive organs," and it is my firm conviction, from a long experience of the influence of "galvanism" on the system generally, that for cholera, in the stage of coldness, and even collapse, a strong continuous current (*not shocks*) from a battery through the cramped parts would speedily restore the circulation and allay the spasm, as every medical man knows that for preserving the vitality of a limb electricity has no parallel. I have only had an opportunity myself of witnessing its effects in five or six cases of cholera, (one with severe cramp in both legs;) in these, however, the results exceeded my anticipations, more particularly in the effect on the urinary organs, and the simultaneous ceasing of the diarrhoea. I have been induced to offer these remarks in the hope that those of the profession who have more frequent opportunities, from their connexion with cholera hospitals, &c., than myself of so doing, will give the subject their attention, and test a remedy which has reason and legitimacy in its favour, does not preclude the use of any medicine, and is attended with neither trouble nor risk. Mr. Meinig's apparatus is a most ingenious contrivance for the aid of medical science. The only thing I have found it necessary to alter has been to substitute a rather large, thin metal plate to communicate the current to the abdomen, instead of the small disc usually connected with the poles of the battery, by which the current is diffused over a large surface, and a warmth produced that is most satisfactory.

In conclusion, I have only to observe that Mr. Meinig has (with a liberality that does him the greatest credit) placed at my disposal any number of batteries that I may require, and I shall be happy to give my services (night or day) in assisting any of my professional brethren, by applying the battery for them in any cases of cholera that may come under their care, so that they may satisfy themselves and the public as to the merits or otherwise of the apparatus.

I am, Sir, your obedient servant,  
Piccadilly, Sept. 1854. GEORGE SPRY, M.R.C.S., &c.

## CHOLERA WITHOUT PREMONITORY SYMPTOMS.

To the Editor of THE LANCET.

SIR,—As a few of your correspondents appear to doubt the fact of Asiatic cholera sometimes commencing without premonitory diarrhoea, I hope the following instances will be sufficient to show them that such a thing does occasionally take place. The first case I shall narrate occurred during the last epidemic of cholera:—

Mary H—, aged forty-three, a married woman, was suddenly seized with cholera during the morning of 2nd September, 1849, while fast asleep in bed beside her husband. A sudden and profuse discharge of rice-water took place from the bowels, of so copious a nature as to completely deluge the bed. Collapse immediately ensued, accompanied with such intense lividity of body, as to justify the remark of her friends, that she had got the "black death." Life lasted just one hour from the commencement to the end of the attack.

In this case there were no premonitory symptoms whatever. I saw the patient the night previous to her illness. She was then in good health, and expressed herself to be so. The bowels had been relieved during the morning; the appetite was good, and the system intact. Shortly after I left she retired to rest, slept soundly, and did not awake till the discharge from the bowels disturbed her. There was but the one evacuation, amounting, as nearly as I could estimate it, to two gallons.

The second case occurred a short time since, and took place in the person of a child two years old. The boy at the time was enjoying good health, and playing in his mother's kitchen. A sudden discharge of rice-water took place from the bowels, followed by vomitings, cramps, and collapse.

This patient recovered. The boy had no motion from the bowels for two days previously.

These, Sir, are the only cases of which I am personally cognizant; but you may depend upon their authenticity. The profession at large, I have no doubt, can furnish many others. Allow me, however, to protest, *in limine*, against any man, or

bodies of men, laying down, in medicine, dicta of their own, as infallible rules of faith. Each member of the profession, however great his experience may be, ought to remember that he is but an unit in the great body corporate, and his experience alone a drop in the ocean, proving nothing. Truth, the brightest gem in the diadem of Nature, must be patiently and diligently sought for, not in scattered and isolated efforts, but in a well-directed and concentrated research; each student of Nature feeling himself to be, like Sir Isaac Newton, "but a child gathering pebbles on the sea-shore of the great ocean of Truth."

I am, Sir, your obedient servant,  
Kennington, Oct. 1854. J. R. OLIVER, A.M., M.D.

## CHOLERA IN EDINBURGH.

To the Editor of THE LANCET.

SIR,—Since the outbreak of cholera here, there have been, as far as I can learn, 205-10 cases treated, of this number 150 have died. As far as I can ascertain, the castor oil plan of treatment has not been generally had recourse to; in some few cases where this plan has been tried, it has failed entirely. The cholera hospital here is, I believe, under the charge of Dr. Warburton Begbie. On the day of my visit to the hospital two new cases were admitted. After trying to ascertain from the patients the period of their seizure, &c., Dr. Begbie ordered the administration of a mustard emetic, and then directed that the patient should have a scruple of calomel at once, and one grain should be given every hour, leaving directions that (if necessary) hot bottles should be applied to the feet, and that the legs and spine should be well rubbed with turpentine. This plan seemed rational, and in accordance with Dr. Ayre's suggestion.

Dr. Dyce, who was sent to take charge of the cholera cases in the Lunatic Asylum, Perth, tells me that, before his arrival, the castor oil plan had been tried by the physician to the Asylum, and had been abandoned as not being of the slightest use. Dr. Dyce treated all his cases by tincture of rhubarb at first, and after that by administering the vegetable astringents, and with partial success. In a week or two I hope to be enabled to send a table of the seizures, deaths, and recoveries, with the kind of treatment.

I am, Sir, your obedient servant,  
Edinburgh, October, 1854. W. H. B.

## THE WAR.

DÉPÔT INVALIDÉ CAMP, GALATA,  
Sept. 13th, 1854.

BEFORE leaving England, you desired me to send some account of the health of the troops, &c., and as I am left behind in charge of some of the sick, the army having gone, we believe, to Sebastopol, I shall endeavour to do so. The health of the men was good until they landed in Bulgaria, nothing of any consequence having occurred in the first division previous to their encampment at Varna, where diarrhoea first showed itself, in some of a choleraic type. From hence they removed to Aladyn, where several cases of low fever occurred; and toward the end of July and beginning of August, cholera of a most rapid and fatal form, at the same time nearly all the men more or less suffering from diarrhoea, appearing listless, without appetites, many falling out on any parade, even roll parade, and when asked what was the matter with them, the invariable answer being, "Looseness of the inside, headache, sickness, weakness, and want of appetite." It was now thought advisable to move us to a more elevated spot, the Aladyn encampment being rather in a hollow, and surrounded by low woods. This was done, and we went to Gevrecleek, some high table-land about four miles distant, and in a northerly direction, and from its appearance it looked most healthy; a large, clear, open space, with a plentiful supply of water. But, alas! we had barely arrived, when a man belonging to one of the regiments was seized with cholera, and was dead within a few hours. He had marched with his regiment. I dread to look back on our stay at this place; let it suffice to mention that men were reported sick at every hour during both day and night; in fact, there appeared to be a constant stream of corporals taking one or more men to hospital; men were dying right and left from cholera of a most malignant form. I will imagine a case. A man is seen at the tent of a medical officer, complains of diarrhoea having existed for some days, with loss of appetite, and weakness; he is sent to the hospital, and when seen again,

in five minutes, found in a state of collapse, blue, with all his features altered, voice a mere whisper, constant sickness, cramps, and rice-water evacuations, and at first you could hardly believe he was the same man that had been seen a short time previously, and in from four to six hours he would be a corpse. Fever still existed, and many of these cases were frequently found in the collapse of cholera, it having come on very suddenly, and so carried off. This state of things continued up to the middle of August, when it began to occur at longer intervals; diarrhoea, however, prevalent the whole time; some of which passed into dysentery; and now, also, fevers became again in the ascendent. It is not to be supposed that the officers escaped; many had diarrhoea, some few cholera and fever; but on account of greater prudence, fever and diarrhoea did not prove so fatal. The non-commissioned officers suffered very much. Many of the medical officers also went away on sick-leave, or incapacitated for work. Indeed, it was and is, difficult to find men for the work. With us, every known, and some unknown remedies have been tried in the cholera, with but little success. Of those who have recovered, the treatment in general, as far as I can speak, has been a mustard emetic, friction, solid opium and calomel for first dose, and then three grains of calomel every ten, or half a scruple every twenty, minutes. In only one case were the gums at all affected. Those who have seen the same disease in India say this form was more fatal and rapid. Here, though the collapse was always so great, if they survived, the subsequent fever was often very slight, and in some hardly perceptible; the sickness was the most persistent symptom; micturition was always followed by improvement. Some men were so conscious of it, that nothing short of the introduction of a catheter would convince them that their bladder was empty. We have now been free from cholera for some time, but low typhoid fever, followed with abscesses, diarrhoea, with or without blood; simple diarrhoea, dysentery, pneumonia, and catarrhs, are most frequent. The days are getting cold, and the nights bitterly so.

In looking for a cause for the former diseases, I think that much must depend on the country being so wild and uncultivated. There is always decay going on; all manner of animals left to decay and "stink" wherever they may fall; even along the shores of the lakes there is a most unhealthy odour, and the heat has been most intense, acting on its boggy margins, as on all damp ground. Otherwise, how could we have disease in so fine a country? The mode of living, no doubt, has much to answer for. On first landing, the men had capital cocoa served out to them. With this they were not satisfied, but begged for coffee, which they got, but in a raw state, so that they had to roast and grind it, without roasting machine or mills. The latter they do between stones, &c. Now they cry out about it, but there is no further change. The allowance of meat is 1½ lb., consisting sometimes of beef, and at times of mutton, and now and then salt pork; also a portion of rice-bread or biscuits, grog, and sometimes porter, for which they pay 1½d. per pint. But they will not be content with this, but buy all sorts of horrid things, and eat unripe fruit off the trees, with which the country abounds. Illness, death, and persuasion have not the slightest effect on them; they will even stroll away from the hospital when in for diarrhoea, and eat away at apples or pears. The ambulance corps have already done good service. I fancy the waggons the best, as the carts have several times been upset, perhaps because the drivers are not yet used to them.

P.S. Cases out here are placed in tents, and consequently under very unfavourable circumstances. The cold is telling dreadfully on all cases in hospital.

## THE CHOLERA.

RELATIVE to the progress of cholera in the metropolis, we condense the following from the "Weekly Return" of the Registrar-General for the week ending September 30th:—

Districts.	Elevation above water mark.	Population (1851).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	50
Central (St. Giles, &c.).....	49 "	393,256	62
Western (Kensington, &c.)	28 "	376,427	113
Eastern (Shoreditch, &c.)...	26 "	485,522	146
Southern (St. Saviour's, &c.)	6 "	616,635	353
Lambeth, &c.)			
			754

Of these 223 were under 15 years of age; 409 were above 15 and under 60; 121 were above 60 years old; 1 the age was unknown. 165 are stated to have died from diarrhoea.

It is thus very evident that the cholera is now rapidly declining in London, the deaths by it having fallen from 2050 in the first week, to 754 in the last week, of September.

The present epidemic eruption began later than the eruption of 1849, and it has latterly been more fatal; but the aggregate mortality will yet probably be less than it was in 1849; for the deaths by cholera in that year down to September 29th were 13,098, while the deaths in the present epidemic down to September 30th have been 9707.

Our attention has been directed to some errors in the Registrar-General's Returns of last week and a few weeks back. With respect to the first, we may observe that it was, as our correspondent remarks, a "clerical error," which was soon discovered by the printer, and corrected accordingly. The proof was right, (we have reason for knowing,) and so was one of the copies we ourselves received. It was so evident, too, that scarcely any mistake could arise, as by reference (if necessary) to the tabular portion the truth would be at once discovered. Relative to the other mistake, the reference of our correspondent has not been sufficiently definite to lead us to discover it on a cursory examination. In justice to the official department concerned, it should be remembered how much more work is thrown upon it during such an epidemic as the present, and that no additional hands are brought into operation. We think it surprising everything is as accurately and as punctually carried on, as it is well known to be; still, we quite agree with our correspondent that merely clerical errors are often "very erratic in effect," and should be noticed accordingly, to avoid further trouble.

We have received Dr. F. W. Richardson's pamphlet,\* in which the opinions are expressed, that "the Report on the Treatment of Cholera [of the College of Physicians] is the most mean and meagre that was ever issued from any Royal College or scientific body;" that "the Asiatic cholera is as curable, even in cases of collapse, as any other disease;" and that "the plan of treatment I have adopted, and found more successful than that of Dr. Ayre's, will prove equally serviceable in the hands of others." This plan is to administer an emetic; to repeat it every ten minutes, if necessary; to give calomel in ten, fifteen, and twenty grains, every ten, twenty thirty, or sixty minutes, and a piece of ice or a teaspoonful of very cold water every five minutes.

## Medical News.

ROYAL COLLEGE OF SURGEONS.—The following members of the College having undergone the necessary examinations, were admitted Licentiates in midwifery, at the meeting of the Board on the 3rd inst:—

BENNETT, EDWIN, Dorchester, diploma of membership dated February 27th, 1852.

JONES, JOHN, Duffryn, Merionethshire, August 5th, 1851.

MAY, EDWARD HOOVER, Tottenham, April 21st, 1854.

STEDDY, EDWARD AUSTEN, Chatham, April 3rd, 1854.

THORP, HENRY JOHN, Maldon, Essex, June 23rd, 1854.

WISE, AMBROSE BLITHE, Holbeach, Lincolnshire, April 21st, 1854.

APOTHECARIES' HALL.—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, September 23th, 1854.

MILLER, THOMAS CORNE, Bedworth.

O'CONNELL, PETER, Waterford, Ireland.

PAUL, JAMES THOMAS, Southsea, Hants.

TREW, THOMAS NEWLAND, West India.

INAUGURATION DINNER OF THE LONDON HOSPITAL MEDICAL COLLEGE.—On Monday last about 200 gentlemen dined together at the London Tavern, to inaugurate this new medical college. The company consisted chiefly of the medical officers of the institution, the teachers of the school, former and present pupils, governors, and well-wishers of the London Hospital, and a few visitors, amongst whom we noticed the Presidents of the College of Physicians and of the College of Surgeons, and the Master of the Apothecaries' Company. Mr. Luke, senior surgeon to the hospital, was in the chair, and

\* The Rational and Successful Treatment of Asiatic and English Cholera and Epidemic Diarrhoea, &c. &c. London and Woolwich. 1854. pp. 18.

from his allusions to the new college, as well as from the remarks of Mr. Smith, chairman of the house-committee, we learn that the building till lately used as the medical school of the hospital had been found, both by long use and the greater importance of the establishment, inadequate for its purposes; and that the committee had generously come forward and undertaken to build a school which was to prove worthy of the modern requirements of such an institution. On the south-western extremity of the ground, upon which stands the London Hospital, a building was therefore erected, at a very large expenditure, which is remarkable both for the architectural taste displayed, and the admirable internal arrangements, calculated to make it one of the most convenient, salubrious, and handsome schools in this metropolis. Mr. Luke expressed his warm acknowledgments to the house committee and governors for their liberality, and especially singled out Mr. Smith as having zealously promoted the erection of the new college. The health of the army and navy, as may well be imagined, was, under the present circumstances, enthusiastically received; and Mr. Guthrie, as the veteran army surgeon, acknowledged the compliment in a short, forcible, and suitable address. Both the President of the College of Physicians and the Master of the Apothecaries' Company returned thanks for respect paid to their corporations. Professor Quekett acknowledged the health of the former pupils of the hospital; and after a few other toasts the company separated with the heartfelt and loudly-expressed wish that the London Hospital Medical College might be very prosperous.

**APPOINTMENT.**—Mr. Henry Goorle, M.B. and L.M. Cantab., has been appointed physician to the Derbyshire General Infirmary.

**SURGEONS IN THE BLACK SEA FLEET.**—It has been stated in the House that the ships of the Black Sea fleet were not short of medical officers. Compare that statement with the following facts:—"All the line-of-battle ships, with two exceptions, are short of one assistant-surgeon each. Two fifty-gun frigates, the *Leander* and *Arethusa*, are also short of one assistant-surgeon each. During the fearful raging of the cholera, it was well known that there was but one medical officer doing duty on board a three-decker, with 950 or 1000 men, a sick-list of nearly 200, and upwards of forty deaths. Some ships were left completely at the mercy of the dreadful epidemic, as their surgeons were required for the service of more infected vessels. The disease is still going on in the fleet. Only two days ago, a steamer having no doctor made a signal for medical assistance. Before it was given to her, three men had gone to their last account. Out of 100 transports now at sea with the fleet, there are only seven or eight ships with medical men, the others depending for assistance on the over-worked doctors of the men-of-war. Is it, then, to be wondered at that, with such an inadequate medical staff, so many of our best sailors have met with miserable deaths? and it is notorious in the fleet that the cholera nearly always attacked the best men. One line-of-battle ship alone lost more than 120 men, and the panic was such, that the crew went aft, and begged that they might leave the ship, and it was accordingly deserted. Many more cases might be quoted, if necessary, but the above will be enough to show the niggardly supply of medical assistance in the naval service. We are now on the eve of a great engagement,—in fact, on our way to attack Sebastopol by both land and sea, and in case of many casualties occurring, which in all human probability must happen, Heaven help the wounded and the dying.—*From a Correspondent.*

**BOARDS OF GUARDIANS AND THE CHOLERA.**—The parish of Lambeth contains a population of 140,000 inhabitants, and cholera has been rife amongst them, notwithstanding which, the sanitary measures adopted by the Board of Guardians are of the most inefficient character. Not only have they refused to adopt the suggestion of the General Board of Health with respect to house to house visitation, but they have been most remiss in carrying out the usual cleansing and precautionary measures. Some idea of the condition of this parish may be gathered from the following facts:—Up to a very recent date, 2 lbs. only of chloride of lime had been used over the whole parish by their inspectors of nuisances for disinfectant purposes; but little lime-whiting has been done—scarcely any by the inspectors of nuisances, although urgently required in many localities. The inspectors of nuisances have had but one man each under their directions for the whole parish during the whole of the pestilence. For nearly six weeks there has been no dust-contractors, and the consequence of this is that the heaps of dust and other refuse matters have not been, in many

cases, removed for from six weeks to two months. Lastly, the condition of the streets with respect to scavenging is disgraceful. Now, all this neglect cannot proceed from ignorance, but the determination to avoid expense, and this at the sacrifice of many valuable lives and at the risk of incurring public indignation. A few inquests in this parish, held in accordance with the instructions of Sir Benjamin Hall, would go far to bring the parish authorities to a sense of their responsibilities and duties.

**RESIGNATION OF AN HOSPITAL SURGEON.**—Mr. Archibald Dalrymple, of All-Saints'-green, Norwich, has resigned his post of surgeon to the Norwich and Norfolk Hospital, solely on the ground of ill health, as he feels himself quite incompetent to the proper discharge of his duties.

**SUSPENSION OF A LONDON PAROCHIAL SURGEON.**—The Board of Guardians of the Holborn Union held a special meeting last week, at the Union Workhouse, Gray's Inn-lane, to investigate a charge of neglect against Mr. Edward White, of Lamb's Conduit-street, one of the parochial district medical officers, for not attending upon a cholera patient, named Mary Macarthy. Mr. White was in attendance, and, after offering an explanation, the Board considered the charge proved, and passed a resolution,—"That Mr. White be suspended from his office for one month from this day." Mr. Cuff, surgeon, of Great James-street, Bedford-row, has been appointed to perform the duties of the district. The evidence taken upon the inquiry has been forwarded to the Poor-Law Board, agreeably to the general order applicable in such cases.

**ALLEGED "MYSTERIOUS" CASE AT NEW BRIGHTON.**—An inquiry, which was headed in the morning London journals "Mysterious Case," has just terminated at New Brighton. The investigation, which took several days' hearing, was held in the sessions-house of that town before the local magistrates. The inquiry was relative to the death of Mrs. Emily Watts, wife of Mr. William Watts, surgeon, of Nottingham, who was charged with having made false returns to the registrar as to the cause of death of his wife, which occurred September 4th. Mrs. Watts, it will be recollected, took an injection of tobacco-water on that morning, which produced death in the afternoon; and on the Wednesday, her husband, who is a surgeon, made a return to the registrar that she had died from constipation of the bowels and effusion into the abdomen. On the Saturday following, an inquest was held upon the body, before Mr. Churton, coroner, when the jury returned a verdict of "Died from an overdose of tobacco." Informations were subsequently laid against Mr. Watts, at the instigation of the brother of the deceased, Mr. Barkworth, of Hull, for having made a false return to the registrar; and the case was partially heard on Wednesday and Thursday. Evidence at great length was then heard, but nothing transpired to directly implicate Mr. Watts in having administered the tobacco-water as an injection to his wife, or even that he had been cognizant of the fact until the Wednesday evening after the death, when he was informed by their servant, Esther Winn. The magistrates decided that there was not sufficient evidence in support of the information to justify them in sending the case to trial.

## Obituary.

**DEATH OF DR. ROUPPELL, F.R.S.**—It is with deep regret that we have to announce the death of Dr. Roupell, by cholera, on the 29th ult., after a few hour's illness. The sudden loss of this amiable and accomplished physician has cast a gloom over a large circle, by whom the remembrance of his name will long be cherished. It were needless, in this short notice, to recall to mind his contributions to medical science, which evince industry, learning, and observation. Long will his loss be deplored by all connected with St. Bartholomew's Hospital. To every one he was kind, affable, and generous; the feeling, humane physician, the perfect gentleman. Although not of robust constitution, Dr. Roupell could endure a considerable amount of mental and bodily labour. His great activity, his simple and temperate habits, and his constant cheerfulness of disposition, gave promise of a lengthened honourable career; an ornament to his profession, a solace to his family, the charm and comfort of his friends. Amongst the latter, the writer of these few lines feels a soothing gratification (amounting almost to pride) in the remembrance of the close attachment and brotherly affection which had existed between the deceased and himself during more than a quarter of a century, wellnigh a life-long testimony to his many virtues. In the death of

this honourable and high-minded man, we can with truth aver that the medical profession has sustained a most severe loss, such, indeed as can be ill afforded from its ranks.

On the 3rd inst., at his residence, Vittoria House, Cheltenham, COURTLAND S. SHAW, M.D., aged forty-two years. The deceased gentleman was the only surviving son of Col. Shaw, of Tenby. He was a magistrate and deputy-lieutenant of the county of Pembroke, and a Fellow of the Horticultural Society.

THE LATE DR. STOCKS, F.L.S.—Dr. J. ELLERTON STOCKS, of the Bombay medical staff, in the service of the Hon. East India Company, and a highly accomplished botanist, died a few days ago at the place of his birth, Cottingham, near this town. Dr. Stocks is best known to the scientific world by his travels and explorations in Beluchistan and Scinde, in which latter country he spent the greater part of the term of his service, at first as vaccinator, and latterly as inspector of drugs. So great was Dr. Stocks' knowledge of the native character, and such was the confidence he inspired in those around him, that he was enabled to penetrate further into Beluchistan than any previous traveller had done since our armies had quitted Afghanistan, his singleness of purpose and remarkable tact disarming suspicion even amongst the most jealous of the native princes. Dr. Stocks was appointed by the Bombay government to the important office of conservator of forests, during Dr. Gibson's absence on furlough, and on that gentleman's return he visited Europe on furlough, chiefly for the purpose of publishing the result of his scientific investigations. He arrived in England during the winter of 1853, bringing extensive collections of plants, which were temporarily deposited at Kew, where he resided for some time, devoting much of his time to the arrangement of his herbarium, and the preparation of a work on the geography, natural history, arts, and manufactures of Scinde. Having completed the arrangement of his herbarium, he started upon a tour in the north of Europe, hoping to return with improved health and renewed vigour to his winter's labours. At the expiration of the period he had assigned to his absence, his friends were anxiously looking forward to his return to Kew, when they received the sad intelligence of his decease. During his stay at Cottingham he was seized with an apoplectic stroke, from which he partially recovered; but a second, after an interval of ten days, carried him off. He was thirty-two years of age, and was son of the late B. Stocks, Esq., formerly manager of the Hull branch of the Bank of England. Dr. Stocks was distinguished for literary and scientific attainments, and was most sincerely loved by all who knew him.—*Hull Packet*, 22nd Sept. 1854.

On the 14th ult., at his residence at Twyford, Berkshire, C. E. ARMSTRONG, Esq., surgeon, in the seventy-fifth year of his age. Mr. Armstrong has not been in practice for the last twenty years, having retired in 1834. He was greatly beloved in his locality on account of his kindly disposition and his untiring practical benevolence, which will long render his name dear to the poor of the neighbourhood, by whom his absence will be greatly felt. He was stated to be the best friend which Twyford has known for many a day.

On the 23rd ult., at Newport, Isle of Wight, GEORGE THOMPSON, Esq., surgeon. The deceased gentleman was an L.R.C.S. in the service of the East India Company, and was superintendent of the Madras Eye Infirmary.

On the 29th ult., at his residence, 72, Norfolk-street, Glasgow, Mr. WILLIAM MUIR. The deceased gentleman was a Licentiate of the College of Physicians and Surgeons, Glasgow, 1831.

On the 25th ult., at his residence, Old Market-street, Bristol, aged seventy-three years, CHARLES JENKINS, Sen., Esq., surgeon.

#### TERMS FOR ADVERTISING.

The following is the Scale of Charges for Advertisements:—

For 7 lines and under..... £0 4 6 For half a page ..... £3 12 0  
For every additional line ... 0 0 6 For a page ..... 5 0 0

Advertisements which are intended to appear in THE LANCET of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of THE LANCET far exceeds that of any other Medical Journal in the world.

#### TERMS OF SUBSCRIPTION TO "THE LANCET."

Six Months... .. 0 17 4  
Three Months ... .. 0 8 8

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, THE LANCET Office, 423, Strand, London, and made payable to him at the Strand Post Office.

## TO CORRESPONDENTS.

*Anti-Bellman.*—Under this signature, a correspondent states that the number of beds in the Birmingham General Hospital is not 230, as stated in the Students' Number of THE LANCET. The number he states to be 190, and at present those occupied amount to only 127. This number, he says, will, in all probability, be reduced, as the funds are derived chiefly from the annual festival, the receipts from which are necessarily precarious.

*Mr. E. C. Summers.*—Conduct such as that detailed is quite unjustifiable. It may be questioned, however, whether any good results would follow from publishing such branches of professional etiquette.

*An Inspector of Nuisances.*—Either Sir W. Burnett's or Crews's disinfecting liquids may be employed. Both of these valuable agents are calculated to afford the most important benefit in all cases requiring the use of chlorine.

*W. B. N.*—Thanks for the information, which has been made use of.

*A Sufferer.*—Reference to the advertising pages of THE LANCET will testify to the value of the preparation.

*Mr. C. Smith.*—We know nothing of the person named.

*Dr. Robert Lee's* important memoir, on the "Ganglia and Nerves of the Uterus," shall appear in THE LANCET of next week.

*A Subscriber.*—No medical school is justly entitled to be considered "the first in the United Kingdom."

DR. LEWIS'S ANSWER TO MR. HORATIO G. DAY.

To the Editor of THE LANCET.

SIR,—I am gratified to learn that my communication in THE LANCET, on Cholera, has gained the approbation of Mr. Day, as well as that of many other professional men of experience and extensive practice. I have never tried the "inspissated ox-gall in small and repeated doses, with a view to its acting as a substitute for the natural bile during the period in which the biliary secretions are suspended," but I think the suggestion is worthy of consideration. I enclose a very instructive note from a veteran in the profession in confirmation of my views.

Very truly yours,

D. LEWIS, M.D.

Finsbury-place, October, 1854.

"DEAR SIR,—I have read your communication to THE LANCET, and I am sure you are right as to the origin of much of the bowel disturbance we have had to do with. In a long practice of forty years I have acted on the same principles, and am satisfied with the result. We have had diarrhoea to deal with largely, and have now about seventy paupers on our list. They have all been treated with magnesia, soda, and carbonate of ammonia, with tincture of opium. Though some few have had cramps and other threatening, only one in our district has died of cholera, and he was an itinerant musician of irregular habits. There has been much pain and discomfort in the bowels, in many cases without diarrhoea, depending upon flatulence of an acid character, (carbonic?) Large quantities have been expelled quite without odour, as many patients have noticed, and all have been relieved by alkalies, ammonia, and powdered rhubarb. I have thought the carbonated alkali somewhat objectionable, owing to the extrication of gas in transit, and have given calcined magnesia in some cases. This seems to reach the large intestine, as carbonate of magnesia I think does, too, without such neutralization as the more soluble alkalies, potash and soda, do in the upper portion of the tube. I have personally experienced this, having suffered from severe pelvic pains at times, only relieved by magnesia, and the expulsion of air from the colon of an acid character, if not arrested by the alkaline earth.

"Cholera has never attacked this place, though it has been several times around us, and is now very rife within six and ten miles, and very fatal. One union doctor has sunk under it. Our exemption has been owing, I think, to an abundance of pure water, its street pumps, to the absence of any gutters with standing water, and to all our houses being built on inclined planes, so that a shower always washes us clean. The disease has been communicated from one to another in the district now affected by it, in the opinion of all professional men who have had to do with it.

"Pray excuse this on the ground of similarity of sentiment. I do not trouble you to acknowledge it, and let me remain,

Yours truly in the bonds of physic, Wm. STOWE.

"Buckingham, Sept. 1854."

*Mr. Stansbury, (Bristol).*—We are obliged for the polite letter, and the information rendered.

*An Occasional Reader, (Maldstone).*—No notice can be taken of any remedy, the composition of which is kept secret.

THE continuation of Mr. Coulson's lecture, on "Suppuration of the Joints," is unavoidably postponed till next week.

THE following original communications—Dr. Marshall Hall on "Tracheotomy in Epilepsia Laryngea;" Mr. Acton on "The Present Condition and Treatment of Diseases of the Urinary and Generative Organs in Paris, compared with those of London;" Dr. R. D. Thomson's "Second Quarterly Meteorological Report for 1854 of St. Thomas's Hospital;" Mr. Sedgwick on a "Case of Hypertrophy of the Heart;" and Mr. Langley on "Bloodletting;" together with the "Mirror of Hospital Medicine and Surgery, and various other articles, which are already in type—are unavoidably postponed.

OTHER correspondents next week.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. Marshall Hall; Mr. Coulson; Dr. Robert Lee; Mr. E. C. Summers; An Occasional Reader; W. B. N.; W. H. B.; Anti-Bellman; G. J., (Glasgow); Mr. C. Smith; Mr. E. Marshall, (Marfield, Clonmel); The Lecturers of St. Mary's Hospital; The Lecturers of St. George's Hospital; Dr. Waller Lewis, (Broadlands); Dr. Oliver, (Kennington); An M.D.; Mr. George Allen; Dr. D. Lewis; Mr. E. H. Bishop; Medious; Mr. Hamilton; Mr. J. Z. Cazenave; A Sufferer; Mr. G. D. Wilson; Mr. Hearder; Mr. F. C. Batt; Mr. Green; Mr. George Bodington; Omicron, (with enclosure); Mr. J. S. Dyke, (with enclosure); Dr. McLoskey, (Rothwell, with enclosure); Dr. Williams, (with enclosure); Dr. Walker, (Tunbridge, with enclosure); Mr. A. Wall, (Long Buckly, with enclosure); Mr. T. H. Wardleworth, (with enclosure); A Subscriber; Mr. Stansbury, (Bristol); An Inspector of Nuisances; &c. &c.

**Water Filter for the Pocket, with**  
 DRINKING-CUP and INSTRUCTIONS, and will filter any quantity  
 of Water. Size, 4 inches by 2. Price 3s. 9d.  
 J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-  
 square.

**Poultices superseded by the use of**  
 MARKWICK'S PATENT SPONGIO PILINE.

As a substitute for common poultices and fomentations, the superiority of  
 this article is unquestionable. It is strongly recommended by the most  
 eminent of the Faculty for its cleanliness, economy, lightness, and general  
 efficacy, and is now used in several of the hospitals. Also Markwick's Patent  
 Piline, for Cholera Belts, Rheumatism, Chest Protectors, Respirators, Lum-  
 bago, &c.

Sold, retail, by Chemists and Druggists, and wholesale only by  
 GEORGE TRIMBEY, 41, Queen-street, Cheapside.

**Teeth.—Mr. Alfred Jones, of Gros-**

venor-street, has recently completed a new and important improvement  
 in the construction of ARTIFICIAL TEETH. The superiority of their  
 appearance, and the unerring accuracy with which they are fitted to the  
 mouth, without wires, springs, or ligatures, and the lightness of their con-  
 struction, gives greater facility in mastication and freedom to the speech, and  
 imparts a more youthful appearance to the countenance than has hitherto  
 been attained; they support any teeth that may be loose, and have been tested  
 by many of the first medical men, the nobility, and gentry, from whom he has  
 received the most flattering acknowledgments of success. Supplied only by  
 Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of  
 Gloucester, her late Royal Highness the Princess Augusta, and his late  
 Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street,  
 Grosvenor-square.—At home from Eleven until Five.

**Hooper's Waterproof Sheeting, for**  
 protecting Bedding from Sloughing Sores, Incontinence of Urine,  
 Hemorrhage, &c.

Mr. Hooper has succeeded in obtaining Waterproof Sheeting, at a great  
 reduction in price, soft, and inodorous; it is not affected by Urine, Heat, nor  
 Cold, Acids, nor Alkalies, and may be washed as family linen.

Also, IMPROVED INVALID URINALS, with Valves, for sitting, lying, or  
 travelling, in any position.

FOR EPILEPSY.

**COTYLEDON UMBILICUS.**—The introduction of this  
 valuable agent has proved a valuable discovery. The satisfactory accounts  
 Mr. HOOPER has received have induced him to pay great attention to its  
 collection and preparation. He cautions medical men against the use of  
 worthless preparations, passed off for his, and as prepared for Mr. Salter, &c.  
 Mr. Hooper has instructions to state that Mr. Salter has never used any but  
 that obtained from him. A copy of Mr. Salter's reports in the "Medical  
 Gazette" sent free by post.

**GALUM APARINE (HOOPER'S) FOR CUTANEOUS**  
**DISEASES, PSORIASIS, &c.**—Dr. Winn, of Finsbury-square, having pub-  
 lished in "The Medical Gazette," October 4th, 1851, an account of the peculiar  
 properties of the Galum Aparine in Cutaneous Diseases, Leprosy, Psoriasis, &c.,  
 Mr. Hooper has given his attention to preparing it in various forms. Dr. Winn  
 finds the inspissated juice the most efficient preparation, which can be had  
 from Mr. Hooper, or direct through the Wholesale Houses.

HOOPER, Operative Chemist, Pall Mall East, and Grosvenor-street.

**Mr. Hooper's Water Mattresses or**

BEDS, and CUSHIONS for AIR or WATER, for placing on an ordi-  
 nary Bedstead. Being made of India-rubber, without the admixture of cloth  
 materials, leakage is avoided. (Extract from THE LANCET, Jan. 25, 1851.)

**CUSHIONS FOR BED-SORES.**  
 —Whether threatened with  
 Sloughing, or in which  
 Sloughing has taken place,  
 Fractures, Diseased Joints,  
 Spasms, Lassitude, Typhoid  
 and other Fevers, Rheumatic  
 Affections, Dropsy, Coldness  
 of the Stomach and Feet,  
 Consumptive and all Bed-  
 ridden Patients. They are  
 simply to be placed on an  
 ordinary bedstead. These  
 Cushions and Beds are not  
 affected by Heat or Cold, and  
 will bear water at any tem-  
 perature.

Finsbury-square, February 27, 1852.

I have in several instances employed Mr. Hooper's Water Cushions and  
 Mattresses; they have in all cases afforded great relief and comfort, and have  
 proved much more convenient and manageable than the Water Bed.

JON. PERRIN, M.D., Physician to the London Hospital.

Infirmary, Chichester, March 21, 1852.

Sir,—We are all much pleased with your Cushions, and still more so with  
 the Mattresses.

Yours truly,

THOS. NEWHAM, House-Surgeon.

HOOPER, 7, PALL MALL EAST, and 55, GROSVENOR-STREET.

**Mr. T. H. Wakley's Stricture Instru-**  
 MENTS. Complete Sets of these Instruments may now be had of  
 WEISS & SON, 62, Strand, London.

**Mr. Edwin Osborne, of 24, Savile-**

BOW, LONDON, begs to apprise the patrons of the late Firm of  
 Dodge and Osborne, that he is now the Sole Licensee and Maker of  
 PALMER'S PATENT (American) LEG; and, having had great experience  
 in its manufacture, feels confident of giving comfort and satisfaction to those  
 persons who may favour him with their patronage. References given (if  
 required).

**Orthopædic Mechanism.**—

Mr. NEATHER BIGG begs to invite the attention of the Faculty to an  
 entirely new principle he has discovered for constructing the various apparatus  
 for deformities of the Feet, Spine, &c. It combines mechanical power with  
 free muscular action; avoids the least chance of abrasion or suppuration, (so  
 often resulting from the mechanical appliances hitherto used,) and assists in  
 every respect an increase of development.

Mr. H. Bigg will most gladly show any medical gentleman, who may be in-  
 terested in the perfection of such contrivances, instruments adapted for  
 Talipes Varus, Valgus, Equinus, Spurious, and Calcaneus; also for Lateral,  
 Posterior, and Anterior Curvatures of the Spine, &c. &c.

All cumbersome mechanism being dispensed with, the cost is lessened and the  
 weight diminished at least one half.—PATENTED.

29, LEICESTER-SQUARE.

**New Spinal Support.—Fr. G. Ernst,**

Lamb's Conduit-street, Foundling Hospital, particularly directs the  
 attention of the Faculty to his newly-invented SPINAL APPARATUS, which  
 has met with universal approval. It possesses advantages not yet obtained  
 in any other form of support; the pelvic portion being self-adjusting, it follows  
 the movements of the body; but at the same time an equal support is yielded  
 to the whole spinal column, whatever position the wearer may assume; the  
 excessive constraint which has constituted one great defect in similar appar-  
 atus is thus removed, and muscular development permitted. It is extremely  
 light, can be worn without fear of observation, and is capable of being adjusted  
 to either description of spinal curvature.

To be had only of the Inventor, 43, Lamb's Conduit-street.

**M. Pillischer's Newly-Constructed**

STUDENT'S MICROSCOPE, which, for solidity, portability, and  
 reasonable price, surpasses any Microscope hitherto made by any English  
 or Continental maker. The Student's Microscope, with coarse and fine  
 adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch  
 French achromatic object-glasses of best quality, the whole packed in  
 mahogany case, 7in. by 6in., £5 10s.; or with M. Pillischer's own-made, 1in.  
 of 16 degs. angular aperture, and 1in. of 60 degs., £7.

The above stand with lever stage, extra eye-piece, double mirrors, animalcule  
 cage, &c., £8; or with Pillischer's glasses, £9 10s.

A list of prices will be sent free on application to M. Pillischer, 89, New  
 Bond-street.

**Mr. Bourjeaud's Registered Elastic**

APPLIANCES, acting spirally, and free from Seams, to be obtained  
 only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's  
 Hotel, London; and 17, Rue des Beaux Arts, Paris.

Fig. 1. At home from One till Five.

Fig. 2.

**Fig. 1. BELT AND AIR-PAD FOR PROLAPSUS UTERI OR ANI.**—  
 Mr. Bourjeaud begs to state that the apparatus here figured has been found  
 extremely useful in cases of prolapsus uteri or ani, and with patients, especially  
 females, who require support for the perineum. The compressing agent is a  
 caoutchouc bag, filled with air; it is in the diagram hanging loose in front of  
 the patient, and is fixed in its place by the strips of elastic tissue, the free ex-  
 tremity of which is seen. The latter is fixed to the lower and posterior margin  
 of the belt, and by the elasticity of the bag and straps sufficient compression  
 is made, and not the slightest uneasiness is experienced. This is a most  
 valuable adjunct to surgical and obstetrical practice, and is highly appreciated  
 by the most eminent members of the profession.

**Fig. 2. This is a most useful belt, called the ABDOMINAL SUPPORTER.**  
 It is made of varying strength, to suit the peculiarities of patients, and is  
 most useful during gestation or after parturition, to forestall the uncomfortable  
 state called pendulous abdomen. During gestation, it relieves the veins from  
 the pressure of the distended womb, and thus prevents swelling of the legs;  
 and after the birth of the child it is most valuable to those ladies who are  
 anxious for the look of their waists. This belt is most useful in cases of dropsy,  
 especially when ovarian, as the pressure may be increased so as to conduce, in  
 favourable cases, to the absorption of the fluid. Mr. Bourjeaud cannot too  
 strongly recommend this belt to corpulent people; they will find it a real  
 comfort.

## GOLD CHAINS AND JEWELLERY.—PRIZE MEDAL.

**W**atherston and Brogden's Gold Chains, by troy weight, at realizable value, and the workmanship at wholesale manufacturer's prices.—The Great Exhibition having established the advantage of purchasing from the wholesale manufacturer wherever it can be accomplished, and thereby dispensing with an intermediate profit, WATHERSTON and BROGDEN beg to announce that, in obedience to the numerous calls made upon them, they have thrown open their Manufactory to the public at the same prices they have been in the habit (for the last half century) of charging to the trade in London, India, and the Colonies. The system of weighing chains against sovereigns being one of the greatest frauds ever practised on the public, WATHERSTON and BROGDEN guarantee the gold in their chains, and will repurchase it at the price charged,—the workmanship, according to the intricacy or simplicity of the pattern. Example:—Intrinsic value of a chain of 15 carat gold, weighing 1½ ounce, £3 19s. 7d.; supposing the workmanship to be £2—total, £5 19s. 7d. By this arrangement the purchaser will see at a glance the proportion charged for labour compared with the bullion in a gold chain, and being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of jewellery all made at their Manufactory, 16, HENRIETTA-STREET, COVENT-GARDEN.—Established A.D. 1798.

### The 16s. Trousers reduced to 14s.—

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

### To Professional Men and others.—

The Oxford Mixed Doeskin Trousers, price 21s. The Stratus Cloth Vest, price 10s. 6d. Stock for choice, or to measure.

S. BATTAM, Coat and Trousers Maker, 180, Tottenham-court-road, five doors south of Schoolbred and Co's.

Patterns of the material and Directions for Measuring sent free per post.

### To all who cannot get a Fit; the

Importance of which requires no elucidation to convince the most sceptical how indispensably necessary it is to health, comfort, and appearance. R. T. FIGRAM, while wishing to avoid the present system of puffing, adopts this means of making known his SELF-ACTING INDICATOR of the HUMAN FIGURE. An invention can only be estimated by its results: a trial will not only give satisfaction, but will justify in favouring R. T. P. with their recommendation.

R. T. Figram, Tailor, 51, Lamb's Conduit-street, Foundling Hospital.

### Assistant-Surgeons.—Gentlemen

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS', 28, WEST STRAND, LONDON, the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, on application.

### Cholera Prevented! Rettie's Patents.

SELF-ACTING SEWER AND SINK TRAPS, for Streets and Kitchen Sinks, to prevent all effluvia from Drains, Cesspools, and Urinals. Damp Houses cured at Fourpence per day, giving a dry, warm temperature, for sick or invalids.

PORTABLE CHAMBER CLOSETS, free from all effluvia. Orders to E. M. and M. Rettie, 7, Brompton-road. (Enclose Stamp.) N.B.—Beware of imitations on the above Patents.

### India-rubber Urinals for Male and FEMALE RAILWAY TRAVELLERS AND INVALIDS.

URINAL FOR TRAVELLING.  
Price 15s. and 18s.

FEMALE URINALS FOR DAY USE.  
Price 21s. and 25s.

The above Urinals are made on the most approved principles, and are all fitted with the recently-invented valve, which will not allow any return of the water by the upper part, by being placed in any position, and from their construction prevent the objectionable smell complained of in those of other Manufacturers.

Manufactured by W. S. SPARKS, 115, New Bond-street, London.  
A liberal discount allowed to the Medical Profession.

### Improved Invalid Cot Carriages—

the greatest luxury and comfort ever introduced for removing invalids, being fitted up with the patent noiseless wheels. These carriages may be engaged, on moderate terms, for any journey, upon application to H. and J. READING, coachbuilders, 14, Riding House-lane, Cavendish-square.—N.B. A good assortment of new and second-hand carriages for sale or hire.

### Patent Perambulators.

C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.

OFFICE, 497, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guineas.

CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

### Purification of Linen—Prevention of

DISEASE.—J. BOILESSVE, 55, King William-street, City, London, solicits the attention of the Nobility and Gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

69, Marylebone-lane, London, Feb. 2nd, 1854.

SIR,—I have much pleasure in informing you, that I am entirely satisfied with the performance of your No. 3 Calorifere, lately put up for warming my manufactory; it has been in operation for a month, and I believe it to be the best and most economical means of drying yet invented, and particularly suited to my business, as there is no dust arising from its use, as there is from the old stoves. The consumption of coke is about one bushel per day.

I am, Sir, yours truly,

SAMUEL HUBERT,

To J. Boilessve, Esq.

Firm of JOHN WOOLLS and Co., Paper-stainers

### Warming and Ventilating, by Hot

AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOILESSVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment—

Highfield, Berkhamstead, Herts., January 24th, 1854.

SIR,—I read some time ago in your valuable paper, an article advocating the need in this climate of warming dwellings with some simple apparatus, giving ventilation, combined with the healthiest temperature, at a great saving of fuel. I am very glad to give you the result of my experience of a new kind of stove, named "Calorifere," erected some months ago at this residence by Mr. J. Boilessve, London; it answers its purpose perfectly; the house and every room to which the ventilation is adapted, is kept at an agreeable temperature, with an entire absence of the oppressive atmosphere usually experienced by all other methods of warming dwellings; that I have seen several persons, some of them highly scientific, who have examined the apparatus and have expressed themselves satisfied, and consider it a most perfect application of warm air and ventilation combined. The cost of warming the house and conservatory attached, has been Eightpence per twenty-four hours, during the late cold weather, and the trouble of attendance is very little. The economy of fuel will cause this stove to be generally adopted, I have no doubt, more especially as the charge for coals is constantly on the increase. The stove in operation should be seen to be appreciated, and I can add, from my experience of its effects during this winter, that it is invaluable for any invalid in so variable a climate as ours, and no one can be aware of the comfort until it is tried.

I am, Sir, yours obediently, a Subscriber,

The Editor of the Times.

R. W. FRASER.

**Allsopp's Pale Ale in Bottle, as**  
supplied to the CRYSTAL PALACE; also in casks of 18 gallons.  
Recommended by BARON LIEBIG.  
Address, HARRINGTON PARKER and CO., 51, Pall-Mall, London.

**Soyer's Aromatic Mustard.**—"M."  
Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.  
Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

**Do you bruise your Oats yet?—New**  
Oat-crushers, £2 15s., £4 5s.; Chaff-cutters, £1 7s., £3 7s.; Mangles, £2 10s.; Flour-mills, £4 10s.—WEDLAKE and CO., 118, Fenchurch-street.—One bushel when crushed makes two.  
How to Keep a Horse for 9s. a Week; or a Book on Feeding, 1s 4d.

**Pure Water.**—Ransome and Co. beg  
to call the attention of the Medical Profession to their ASCENSION PURIFIERS, more particularly to those for immersion, which afford at all times a constant supply.  
Price 21s. and 9s.—Depot, 71, Baker-street, Portman-square.

**Mr. Mechi wishes it to be clearly**  
understood that he CHARGES the SAME PRICES at the CRYSTAL PALACE as at Leadenhall-street: that his manufactures are varied to suit all classes. For instance, Dressing-cases at 25s., or at £150; Penknives at 1s. or 21s.; Tooth-brushes at 6d. or at 2s.; each article being good of its sort. Mr. Mechi's assistants at the Crystal Palace will attend constantly to receive orders and dispose of his manufactures there.—4, Leadenhall-street, June 20.

**Anatomical and Dental Repository,**  
45, Museum-street, Bloomsbury, London.—JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands, and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

**Every excellence which the**  
Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c.  
H. and Co. have much pleasure in informing the Profession that they have perfected an ABDOMINAL BELT of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 18s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stocking: Circumference at A, B, C, D, and E; length from A to D, and D to E.  
HUXLEY and CO., 8, Old Cavendish-street, late 5, Vere-street, Oxford-street.

**Huxley's Fulcrum**  
ABDOMINAL BELT will be found, from its mechanical arrangement, (acting diagonally), and producing the required support for the lower part of the Abdomen, to be the most complete and comfortable arrangement ever invented. It is extremely light, weighing only 4oz. Price 18s.  
Measures required.—Circumference at A, B, and C; depth from A to C.  
A discount of 20 per cent. to the profession.  
HUXLEY and CO., 8, Old Cavendish-street, late 5, Vere-street, Oxford-street.

**Ladies' Belts.—Bailey's**  
ELASTIC LADIES' BELTS are found to be some of the most useful articles in his establishment. They are worn by those who are delicate in constitution, as they support the Back and Abdominal Muscles, giving the greatest possible comfort before and after Accouchement. They are without Buckles or any incumbrances, and easily adjusted. Prices, 18s., 32s., and 42s.  
Those without Elastic are much used by Surgeons for persons immediately after Accouchement, and called Bailey's Compressing Belts. Price 10s. 6d., 15s., and 25s.  
Hospitals and Lying-in Institutions supplied. Females in attendance, and private rooms for trying on. Elastic Stockings and Knee-caps.  
Address, WM. HUNTLY BAILEY, 418, Oxford-street, London.

**Dissecting and Post-Mortem Instruments,** New and Second-hand. Surgical Instruments of the best description; A. URE'S New Urethrotome for Stricture; New Uterine Compress; Newly Improved Pessary; Instruments for Army and Navy Surgeons; DARTNELL'S Patent Truss; Trusses for Union Surgeons; Enema Syringes; New Syphon Enema, as supplied to the Army; New Spinal Machine, pronounced the best ever invented.—at  
PRATT'S, Surgical Instrument Maker, 420, Oxford-street.

**Dinneford's Pure Fluid Magnesia,**  
now greatly improved in purity and condensation.  
"Mr. Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—PHARMACEUTICAL JOURNAL, May, 1846.

This excellent remedy, in addition to its extensive and increasing sale amongst the public, is now very largely employed in DISPENSING: for which the cheapest and most convenient form is in the STONE JARS; half-gallon, 5s. 6d.; gallon, 9s. 6d.; specially adapted for the use of Surgeons and Chemists. To be had from the manufacturers, DINNEFORD & CO., Chemists, 172, Bond-street, London; and all respectable Wholesale Druggists and Patent Medicine Houses.

**Meinig's Electro-Generator,**

FOR CHOLERA.

TO THE MEDICAL PROFESSION.

Having witnessed personally the greatest benefit, in the first stages of Cholera, derived from the application of weak, continuous currents of Electricity from the spine to the abdomen, by which the warmth and action of the digestive organs is maintained, and the urinary functions stimulated; and feeling confident that in an advanced stage of the disease strong, interrupted Electric Currents passed along the cramped and paralyzed limbs, and along the spinal column, will be found of paramount efficacy in restoring normal circulation, Mr. Meinig earnestly invites the Medical Profession to test and investigate the effects of Electricity in the now prevalent epidemic; and so confident does he feel of the all but marvellous success of his Apparatus in this dreadful disease, that any medical gentleman who desires it may receive Mr. Meinig's warrant, to the effect that he will retake and repay, within one month after the purchase, any Apparatus which, after trial, it might be wished to return.

Prices of the Portable Generator: 5s., 10s. 6d., 15s., 20s., and 30s., according to power. Powerful Pocket Batteries, £3 3s.  
103, LEADENHALL-STREET, and 213A, PICCADILLY.

**Francis L. Puckeridge, Sole Inventor**  
and Manufacturer of the late Mr. R. LISTON'S WATERPROOF TRANSPARENT ISINGLASS MEMBRANE PLASTERS, now patronized by Mr. Liston's successor, Mr. Quin, in his hospital and private practice; patronized likewise by Mr. W. Ferguson, Surgeon, of King's College Hospital; Mr. J. M. Arnott and Mr. Wormald, of Bartholomew's Hospital. Used for amputations and other serious wounds, requiring observation without exposure to the air.

F. L. P. begs to state there are two qualities, and is particularly beneficial for Spinal Complaints, Ruptures, Sprains, or any weakened part; also, a Defensive Skin, to apply between the wound and the lint, and cause less pain in dressing. Likewise, a superior Gauze Lisse, waterproof and not waterproof, of the same adhesive properties as the Membrane; also, superior Tinted Court Plasters and Tinted Goldbeaters' Skin, by the yard and in cases. F. L. P. offers his most grateful thanks for the encouragement and kind patronage he has received from the Medical Gentlemen of England and foreign parts, and hopes to merit a continuance of their favours by manufacturing his Plasters with the same unremitting care as heretofore.

May be had of the Proprietor, 4, York-place, Walworth, Surgical Instrument Makers, Chemists, &c., with improved directions how to apply.

**Hare-Lip.—Extraordinary Application and CURE.**

Communication from Mr. BROADBENT, Surgeon, Ferry Hill, Durham.

MR. BENJAMIN NICKELS,  
SIR,—I wish to state concerning your Plaster to the following effect. About ten days after an operation for Hare-lip, the boy fell against a stone step and ruptured the lip. The day previously I had received your Elastic Plaster, and on being summoned to the boy, (without much hope of success,) I applied three strips of the Plaster, extending from ear to ear, bringing the ruptured edges into apposition. Seven days after the Plaster retained the cheeks in the position I had left them on the day of application. Fresh strips were then applied, and the edges ultimately united. In my opinion, no other plaster could have answered the intention, and I think it specially adapted to wounds on the face.

I remain yours obediently.

(Signed) G. W. BROADBENT.

NICKELS'S PATENT ELASTIC ADHESIVE PLASTER, and ELASTIC ADHESIVE BANDAGES, which are made on quite a new principle, rendering them a cheap, efficient, unvarying support as a spiral covering, or stocking (without the trouble of lacing), for varicose veins, sprains, weak joints, and all rheumatic affections. These Bandages may also be cut and applied as ordinary strapping.

The Patente has had the honour of receiving the highest testimonials in approbation of his ELASTIC PLASTERS from the following most eminent Members of the Profession, and many other Gentlemen, by whom they are patronized and used in their hospital and private practice:—J. C. W. LEVER, M.D., Physician Accoucheur, Guy's Hospital. Mr. FERGUSON, Surgeon to his Royal Highness Prince Albert, Prof. Surgeon, King's College, London; Surgeon King's College Hospital. Mr. HILZOW, Surgeon, Guy's Hospital, Surgeon to the City of London Hospital for Diseases of the Chest.

THE PATENT ELASTIC COURT PLASTERS are found most superior both in appearance and quality.

Sold by all principal Chemists in the United Kingdom, and by Mr. BENJAMIN NICKELS, Surgical Plaster Manufacturer, 9, Camberwell-green, London.

## Medical Society of London.—The

FIRST MEETING of the SESSION, 1854-55, will be held on SATURDAY next, October 14th, at Eight o'clock P.M., when an Address on "Cholera" will be delivered by E. HEADLAND, Esq., the President of the Society.

E. SMITH, M.D., LL.B., } Hon. Secs.  
C. H. ROGERS HARRISON, }

32 A, George-street, Hanover-square.

## University of London.—Notice is

hereby given that the SECOND EXAMINATION for the Degree of BACHELOR OF MEDICINE, for the present year, will commence on Monday, the 8th of November; and that for the Degree of DOCTOR OF MEDICINE, on Monday, the 27th of November.

The Certificates required must be transmitted to the Registrar, fourteen days before the commencement of the Examination to which they refer.

By order of the Senate,

Marlborough House,  
Sept. 25th, 1854.

E. W. ROTHMAN, Registrar.

## Mr. G. Hind, F.R.C.S., resumed his

DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.

Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-recent, Bedford-square.

## Kelvedon School, Essex.

Conducted by Mr. W. WISEMAN, M.C.P.

The Studies of Young Gentlemen intended for the Medical Profession are so arranged at this Establishment as to qualify them, on leaving, for passing the Preliminary Examination at the University of London or Apothecaries Hall.

Terms, from Thirty Guineas to Fifty Guineas per annum, according to the accommodation, &c., required.

## School for the Sons of Medical Men,

CLERGYMEN, OFFICERS OF HER MAJESTY'S ARMY, NAVY, AND CIVIL SERVICE, &c.

ST. JOHN'S FOUNDATION-SCHOOL, Greville-mount House, Kilburn, London.

Head Master—The Rev. Anthony F. Thomson, B.A. Lincoln College, Oxford, (eldest surviving son of the late Dr. Anthony Todd Thomson, of University College.)

Mathematics—Gowan Evans, Esq., M.A. Lincoln College, Oxford.

German—U. Green, Esq., (Nieuwied College, Coblenz.)

French—Hy. Poittevin, Esq., (Paris.)

Music—Dr. Charles Steggall, Trinity College, Cambridge; Professor of the Royal Academy of Music, London.

The system of this School is particularly adapted to prepare Boys for the Medical Profession, the Army, whether Line or Artillery, the Navy, and Civil Service.

The Terms are moderate and inclusive. The House is new, and has been built with a special view to its purpose, at a cost of over £3000. It is situated on high ground, in the most healthy and beautiful position in the north of London.

A Prospectus, with full details, may be had on application to the Head Master, at the School.

## St. Bartholomew's Hospital and

MEDICAL COLLEGE.—The WINTER SESSION Commenced on October 2nd, with an Introductory Address by Dr. Burrows.

### LECTURES.

Medicine—Dr. Burrows.  
Surgery—Mr. Lawrence.  
Descriptive Anatomy—Mr. Skay.  
Physiology and Morbid Anatomy—Mr. Paget.  
Chemistry—Mr. Stenhouse.  
Superintendence of Dissections—Mr. Holden and Mr. Coots.

### SUMMER SESSION, 1855, Commencing May 1st.

Materia Medica—Dr. Roupell.  
Botany—Dr. F. Farre.  
Forensic Medicine—Dr. Daly.  
Midwifery, &c.—Dr. West.  
Comparative Anatomy—Mr. McWhinnie.  
Practical Chemistry—Mr. Stenhouse.  
Natural Philosophy—Dr. Martin.

HOSPITAL PRACTICE.—The Hospital contains 650 beds, and relief is afforded to nearly 80,000 patients annually. The in-patients are visited daily by the Physicians and Surgeons, and Clinical Lectures are delivered weekly; those on the medical cases, by Dr. Roupell, Dr. Burrows, and Dr. Farre; those on the surgical cases, by Mr. Lawrence, Mr. Stanley, Mr. Lloyd, and Mr. Skay. The out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

COLLEGIATE ESTABLISHMENT.—Warden, Dr. BLACK. Students can reside within the Hospital walls, subject to the rules of the Collegiate system, established under the direction of the Treasurer and a Committee of Governors of the Hospital. Some of the teachers and other gentlemen connected with the Hospital also receive students to reside with them.

SCHOLARSHIPS, PRIZES, &c.—At the end of the Winter Session, examinations will be held for two Scholarships of the value of £45 for a year. The examination of the classes for prizes and certificates of merit, will take place at the same time.

Further information may be obtained from Mr. Paget, or any of the Medical or Surgical Officers or Lecturers, or at the Anatomical Museum or Library.

### TO THE PROFESSION.

## Mr. Bowmer, M.R.C.S. Eng., 50,

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with *Assurances*, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

### TO MEDICAL MEN.

## To be Disposed of, a small but well-

established PRACTICE in Berkshire, with club appointments to the amount of about £20 a-year. £280 required, being about one year's returns. So good a nucleus for making a large Practice is seldom met with. Superior house and grounds, rent only £20.—Direct to A. B., care of Mr. Gordon, 17, Hemingford-cottages, Richmond-road, Islington, London.

## To be Sold, the Lease of a most de-

strable and long-established PROFESSIONAL RESIDENCE, in Savile-row, at a low rent.—Apply to Mr. Churchill, 11, New Burlington-street.

### TO SURGEONS.

## On the High Road, Peckham,

between High-street, and New-cross, a Corner HOUSE, first-rate situation for business, of a superior description, to be LET very low. Three or four hundred houses recently erected on the estate, and no medical man upon it. Apply at the house corner of King's-road, from 12 till 4.

## Apartments, Furnished or Unfur-

nished, may be had in the House of a Medical Man, situated in a healthy locality near the South Coast, having every facility of access by railway. The above is peculiarly suitable for a married couple, or a lady, or two sisters. A Boarder would be preferred.—Reference may be made to Messrs. Gale, Baker Warde, and Co., Druggists, Bouverie-street, Fleet-street.

### TO MICROSCOPISTS.

## To be Disposed of, at a great sacri-

fice, by M. PILLISCHER, Optician, 88, New Bond-street, a MICROSCOPE, by ROSS, with a complex set of Object-Glasses and Apparatus, &c.

## Skull, beautifully mounted à la Bau-

chène, under Glass Shade. To be sold cheap.  
Mr. LAWSON, Bookseller, 19, Melton-street, Euston-square.

### TO PROFESSORS OF ANATOMY, STUDENTS, &c.

## Dr. Kahn continues to execute every

description of ANATOMICAL and PATHOLOGICAL WAX MODELS. For a List of Prices apply at 232, Piccadilly.

DR. KAHN'S ANATOMICAL MUSEUM is open Daily, from Eleven till Five, and from Seven till Ten. Admission, One Shilling. Lectures, as usual, by Dr. SAXTON, F.R.G.S., and F.E.S.

## St. Mary's Hospital.—A fourth

RESIDENT MEDICAL OFFICER, duly qualified, will be recommended to the Weekly Board for Election, whose duties will be to take charge of the Patients in the Maternity Department. Apartments and Board will be provided by the Hospital.

Gentlemen desiring to fill the above Office are requested to send their applications with Testimonials to the Secretary at the Hospital, from whom further particulars may be obtained, on or before Saturday the 14th instant.

Board Room, Oct. 2, 1854.

ROBT. J. NEWMAN, Secy.

## General Kent and Canterbury Hos-

pital.—A Vacancy has occurred in the Office of DISPENSER and ASSISTANT to the House Surgeon of this Hospital. He is provided with Board, Lodging, and Washing, and receives a Salary of £40 per annum.

The Candidates, who must be Licentiates of the Apothecaries' Company in London, unmarried, and under forty years of age, are requested to send their Testimonials of qualification and character, with a statement of their previous employment, to the Secretary, on or before Friday, October 27th, after which the day of election will be fixed.

September 29th, 1854.

THOMAS SOUTHER, Secy.

## Calne Union.—The Board of

Guardians of this Union give notice, that on Wednesday, the 15th of November next, at noon, they will elect a MEDICAL OFFICER for the entire Union, who must be duly qualified according to the Commissioners' Order of 12th of March, 1842. He will be restricted from private practice, and will be required to devote his whole time and attention to the duties of his office, and keep a horse. The salary is £200 per annum, without extra fees for Surgical or Midwifery cases. Drugs, &c., will be provided at the charge of the Union, and assistance will be rendered in dispensing Medicines. Vaccination will be paid for at per successful case. Applications, accompanied by testimonials, to be made to the Clerk, on or before Tuesday, the 31st of October instant.

By order of the Board,

Calne, Wilts, October 4th, 1854.

HENRY S. HEATH, Clerk.

## Matrimonial Institution.—Founded

1846.—Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CUREUX, 12, John-street, Adelphi, London.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.  
Office hours from 12 till 4.

**Death Vacancy.—Immediate.—A**

Surgeon of standing, with a good-class General Practice of about £1000 a year, situated in a favourite market-town, easily reached from London, has just died. A doubly-qualified Gentleman, about thirty years of age, with £200 or £700 at command, may make a very favourable arrangement with the widow.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**Lunatic Asylums.—Wanted, by a**

Medical Man well versed with the treatment of the Insane, a SITUATION in an Asylum.—Apply by letter to A. B., 39, Poultry, London.

TO SURGEONS AND APOTHECARIES.

**To be Disposed of, the Shop, No. 17,**

Newington-causway, lately occupied by Mr. Barnes, now deceased. Fixtures to be taken at a valuation. Apply at No. 27, King-street, Borough.

**To be Disposed of immediately, a**

good PRACTICE. Receipts near £400 per annum. An immediate purchaser will be introduced on the most liberal terms.—Address, pre-paid, Beta, THE LANCET Office, 423, Strand, London.

**An M.R.C.S. and L.A.C., married,**

and without family, wishes to take charge of a Branch Practice in the country, or to be Out-door Visiting ASSISTANT. A liberal salary expected.—Address, stating particulars, to Medicus, Post-Office, Brompton, London.

**A Third-Year's Student offers his**

services to a Surgeon in General Practice, whose arrangements would allow him time for study. He can be highly recommended by the gentleman with whom he is now residing. Address, A. Z., Post-office, Torrington-place.

TO SURGEONS.

**Wanted, a Surgeon duly qualified**

by law, in a fine First-class Ship proceeding to Australia.—Apply to John Bonus and Son, 81, Gracechurch-street.

**Wanted, in the Country, an English**

Gentlemen, as Visiting and Dispensing ASSISTANT.—Address, stating age and references, to H. C. S., THE LANCET Office, 423, Strand, London.

**Wanted, in a highly respectable**

Town and Country Practice, a Medical ASSISTANT, of active habits to Visit, Dispense, and attend Midwifery.—Apply, stating terms, references, and qualifications, to A. B., Post-Office, Abergavenny, Monmouthshire.

**Wanted immediately, an active**

Visiting and Dispensing ASSISTANT, competent to attend Midwifery, between twenty-six and thirty years of age. Apply to Mr. Josh. Dakin, Chemist, High-street, Poplar.

**Wanted, by a General Practitioner,**

an ASSISTANT to Dispense, occasionally to Visit, and attend Midwifery.—Apply personally or by letter to F. A. C., 2, Charlotte-row, Walworth-road.

**Wanted, by a Gentleman who has**

been some years in the Profession, a Situation as ASSISTANT, (the neighbourhood of Charing-cross or Middlesex Hospitals would be preferred.) Board and Lodging, with time to attend Lectures, &c., would be considered equivalent to his services.—Address, J. D. F., THE LANCET Office, Strand.

**Wanted, by an M.R.C.S. Eng. and**

L.S.A., aged twenty-five, who has been two years House-Surgeon to a large Hospital, and is well acquainted with Union and General Practice, a Situation as Out-door Visiting and Dispensing ASSISTANT. A liberal salary required.—For testimonials and references, address, Omicron, Mr. Watson's, Long Buckby, Northamptonshire.

**Wanted, by a Surgeon in a large**

provincial town, a Visiting ASSISTANT, who must also assist in Dispensing. He must be above twenty-five years of age, and able to obtain good testimonials of knowledge of his profession and general character. Legal qualifications not essential, but will be preferred. Salary £50, with board, &c. Address to Medicus, care of J. Dale and Co., stationers, Bradford, Yorkshire.

**To be disposed of, in consequence of**

the continued indisposition of the proprietor, Mr. Elijah Pring, the Good-will, Stock, Fixtures, &c., of that well-known establishment, the MEDICAL HALL, No. 30, Westmoreland-street, Dublin, (established in 1821,) now in full working order, and to which a highly respectable and numerous connexion is attached. The business, until disposed of, will be carried on as usual. The fullest information can be had of Messrs. Herring and Co., 40, Aldersgate-street, London; of Mr. Graham, No. 12, Cope-street, Dublin; and of Messrs. Grattan and Co., Belfast; or at the premises.—18th September, 1854.

**Medical Transfer and Partnership.**

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RELINQUISH, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

**Death Vacancy.—The Decease of a**

Gentleman conducting an extensive and highly-respectable Practice, renders an immediate arrangement desirable with a competent Successor, who must possess the English qualifications, and be in every respect fit to conduct a General Practice of the kind.—Apply, giving London references, to M.D., care of Mr. ORRIDGE, 30, Bucklersbury, London.

TO SURGEONS.

**A Practice, with Retail, in St. John's**

Wood, in a commanding situation, with ample scope for securing an extensive connexion, is obtainable for £300.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

**General Practice, Lincolnshire.—To**

be Disposed of, the Succession to a highly-respectable Connexion, in one of the best towns in Lincolnshire.—For particulars, apply to Delta, care of Mr. ORRIDGE, 30, Bucklersbury.

TO SURGEONS.

**A Gentleman, married, (unqualified,)**

is in immediate want of a Situation as General Assistant in town or country. Can produce unexceptionable references, &c. Apply by letter to J. R. R., 76, Railway-terrace, Redhills, Birmingham.

TO MEDICAL PRACTITIONERS.

**The Advertiser wishes to obtain a**

Situation as ASSISTANT to a General Practitioner in a good locality, (without retail.) Salary not a primary object. Apply to A. B., 2, Bessborough-gardens, Piccadilly.

TRAVELLING TUTOR.

**A Clergyman, purposing to spend**

the winter months in the South of Europe, wishes to meet with a Pupil, for taking charge of whom he would require no further remuneration than the payment of his expenses. Address, M.A., Christ-church, Oxford.

**To be Disposed of, a General Medical**

PRACTICE in Devonshire, realizing between £300 and £400 a year. The Advertiser is desirous of leaving at Christmas, and a lower premium than is usual will be taken for the Practice in consequence.—Apply by letter to L. R. Y., Tavistock Hotel, Covent-garden, London.

**General Practice to be Disposed of,**

between thirty and forty years established, in a highly-respectable and populous neighbourhood in the county of Suffolk, with Union Appointments, Clubs, &c. Receipts about £500 per annum.—Address, F. G., 1, Norton Folgate, London.

TO DENTISTS.

**A Practice to be Disposed of, esta-**

blished a number of years, satisfactory reasons can be given by the present Practitioner for resigning.—For further particulars, apply to A. B., 9, Bridge-terrace, Harrow-road, Paddington.

TO MEDICAL AND OTHER STUDENTS.

**A Surgeon, whose house is larger**

than he requires, can accommodate three or four Gentlemen with Bedrooms and Breakfast, use of Sitting-room and attendance, at Two Guineas per Month each, and additional Board if required, at equally moderate terms. Central for St. Bartholomew's, University, Middlesex, King's College, and the Royal Free Hospitals.—M.R.C.S., 18, Hunter-street, Brunswick-square.

**A Visiting and Dispensing Assistant**

wanted by a Practitioner, in a small town within forty miles of London, competent for Union Practice and Midwifery. To reside in the house. Salary from £40 to £60 a year, as the qualifications may be.—Address, by letter, C. D., at Messrs. Corbyn and Co., 300, Holborn, stating age, qualifications, and references or testimonials.

MEDICAL.

**A Student, desirous of attending**

Charing-cross Hospital, is willing to engage with a Gentleman in that neighbourhood, requiring the services of a Dispenser and Junior-Assistant, competent to visit occasionally, and perform minor operations in Surgery. For his services board and lodging will be considered equivalent. For further particulars address C. D., Messrs. Gale, Baker, Warde, and Oldfield, Bouverie-street, Fleet-street.

**In an Establishment three miles**

west of London, YOUNG LADIES are RECEIVED to BOARD and EDUCATE, at 30, 35, and 40 guineas per annum, inclusive terms. A garden of nearly two acres in extent.—For prospectuses, address M. X., Barker's Library, Dorcas-terrace, Hammersmith.

# DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,  
AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM,  
AND ALL SCROFULOUS DISEASES.

**A**pproved of and recommended by **BERZELIUS, LIEBIG, WOEHLER,**  
**JONATHAN PEREIRA, FOUQUIER,** and numerous other distinguished scientific Chemists.  
Prescribed by the most eminent Physicians, and supplied to the leading Hospitals of Europe.  
Specially rewarded with Medals by the Governments of Belgium and the Netherlands.  
Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—  
effecting a cure or alleviating symptoms much more rapidly.  
Contains iodine, phosphate of lime, volatile acid, and the elements of the bile—in short, all its most active and essential  
principles—in larger quantities than the Pale Oils made in England and Newfoundland, deprived mainly of these by their  
mode of preparation.

*The following Extracts are selected from some of the leading Medical and Scientific Testimonials in favour of*  
**DR. DE JONGH'S COD-LIVER OIL:—**

**BARON LIEBIG,**

Professor of Chemistry at the University of Giessen, &c. &c.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use."

The late

**Dr. JONATHAN PEREIRA,**

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

**Dr. FOUQUIER,**

Professor at the University of Paris, Physician to his late Majesty Louis Philippe, &c. &c.

"You have preserved to science the use of a medicine that might have fallen into utter discredit, in consequence of its unaccountable inaction in some cases."

**Dr. E. RINGEL,**

Of Carlsruhe, Grand Duchy of Baden.

"This analysis has convinced me that Dr. de Jongh's Oil is not only prepared with greater care than the ordinary Cod-liver Oil, but that it contains in larger quantities those principles which are generally admitted to be most active and essential, so that it ought to be considered the most efficacious kind."

**Dr. SEGNIß,**

Of Gelnhausen, Duchy of Hessen.

"I AM bound to state that this Oil is greatly superior to all other kinds previously used by me, and that, therefore, the object aimed at by the use of this remedy is more surely attained by this Oil than by any other kind."

The

**INTENDANT OF THE CIVIL LIST OF BELGIUM.**

"THE King has charged me to return you his very particular thanks for the homage done to him, by the presentation of your most valuable researches concerning the Cod-liver Oil: as an expression of his utmost satisfaction, he has given me the order of presenting you with the accompanying large Gold Medal."

**Dr. VAN DEN STIGEN,**

Emmerich.

"I CAN conscientiously recommend it to my colleagues as being superior to all other kinds."

The

**MINISTER OF THE INTERIOR OF HOLLAND.**

"I HAVE the honour of bringing to your knowledge, that it has pleased the King to grant you, by his Decree of the 20th January, 1848, No. 101, a Silver Medal with an appropriate honorary inscription, as a testimony of his Majesty's high approbation for your efforts in securing to this country a supply of the most efficacious Cod-liver Oil from Norway. I have given the necessary orders for the execution of this Medal."

**THE ROYAL POLICE OF PRUSSIA.**

"THE Royal Police of Prussia (Königliches-Polizei-Præsidium) has the honour of informing you that it has caused the sample which you have forwarded to be submitted to an official investigation, and that the result of such investigation has proved it to be not only the genuine Cod-liver Oil, but still further, that it is of a kind which distinguishes itself from the Cod-liver Oil in ordinary use, alike by its taste and chemical composition."

**"THE LANCET,"**

(July 29th, 1864.)

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. IN THE PREFERENCE OF THE LIGHT-BROWN OIL OVER THE PALE OIL WE FULLY CONCUR."

"WE HAVE CAREFULLY TESTED A SPECIMEN OF THE LIGHT-BROWN COD-LIVER OIL, PREPARED FOR MEDICAL USE UNDER THE DIRECTION OF DR. DE JONGH, AND OBTAINED FROM THE WHOLESALE AGENTS, MESSRS. ANSAR, HARFORD, AND CO., 77, STRAND. WE FIND IT TO BE GENUINE, AND RICH IN IODINE AND THE ELEMENTS OF BILE."

**"THE MEDICAL TIMES,"**

(August 5th, 1864.)

"We believe that the profession are much indebted to Dr. de Jongh for his laborious researches into the composition and properties of this Oil; and we have the high authority of Baron Liebig and the late Dr. Pereira, in testimony of the value of these labours. In his zeal for investigating the properties of the Oil, Dr. de Jongh made a journey to Norway, and carefully examined its varieties, its mode of preparation, and its adulterations."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S Stamp and Signature, by

**ANSAR, HARFORD, & CO., 77, STRAND, LONDON,**

Sole Consignees and Agents for the United Kingdom and British Possessions, at the following prices:—

HALF-PINTS ... .. 2s. 6d. | PINTS ... .. 4s. 9d. | QUARTS ... .. 9s.

**IMPERIAL MEASURE.**

**\*\* Hospitals and other Charitable Institutions requiring large quantities may be supplied on considerably reduced terms.**

PRINTED BY THOMAS CHROATE SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CHURCHILL, of No. 423, Strand, in the parish of St. Martin-in-the-Fields, Westminster, in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—  
Saturday, October 7, 1864.

## NEW EDITIONS OF THE FOLLOWING MANUALS.

### FOWNES' MANUAL OF CHEMISTRY.

With numerous Illustrations on Wood.

EDITED BY

H. BENCE JONES, M.D., F.R.S.,

AND

A. W. HOFMANN, F.R.S.

Fifth Edition. Foolscap 8vo, cloth, 12s. 6d.

Making 13,000 Copies.

### ELEMENTS OF NATURAL PHILOSOPHY.

BEING AN EXPERIMENTAL INTRODUCTION TO THE STUDY OF THE PHYSICAL SCIENCES.

With numerous Illustrations on Wood.

By GOLDING BIRD, M.D., F.R.S.,

AND

CHARLES BROOKE, M.B. CANTAB., F.R.S.

Fourth Edition. Fcp. 8vo, cloth, 12s. 6d.

Making 6250 Copies.

### THE ANATOMIST'S VADE-MECUM;

A SYSTEM OF HUMAN ANATOMY.

With numerous Illustrations on Wood.

By ERASMUS WILSON, F.R.S.

Sixth Edition. Fcp. 8vo, cloth, 12s. 6d.

Making 15,000 Copies.

LONDON:

JOHN CHURCHILL, NEW BURLINGTON STREET.  
No. 1624.

Just published, in fcap. 8vo, cloth, price 7s.

## A Treatise on Hooping-Cough, its

Complications, Pathology, and Terminations; with its Successful Treatment by a New Remedy. By GEORGE D. GIBB, M.D.  
London: Henry Benschaw, 358, Strand.

TANNER'S PRACTICE.

In 32mo, sewed, cloth, price 3s. 6d.

## A Manual of the Practice of Me-

DICINE. Second Edition, re-written, enlarged, and much improved. By T. H. TANNER, M.D., Licentiate of the Royal College of Physicians, and Physician to the Hospital for Women.

"The work is up to the present time on all points."—MEDICAL TIMES.

London: Henry Benschaw, 358, Strand.

The Third Edition, in One Volume, 8vo, price 14s.

## Lectures on the Diseases of Infancy

AND CHILDHOOD. By CHARLES WEST, M.D., Physician to the Hospital for Sick Children, and Physician-Accoucheur to St. Bartholomew's Hospital. The Third Edition, revised throughout and enlarged.

By the same Author, in 8vo, price 5s.

## AN INQUIRY INTO THE PATHOLOGICAL IMPORTANCE OF ULCERATION OF THE OS UTERI.

London: Longman, Brown, Green, and Longmans.

Now ready, large 12mo, 4s. 6d., cloth,

## On Pain after Food; its Causes and

TREATMENT. By EDWARD BALLARD, M.D. Lond.; Lecturer on the Practice of Medicine at the School of Medicine adjoining St. George's Hospital; Author of the "Physical Diagnosis of Diseases of the Abdomen."

London: Walton and Maberly, Upper Gower-street, and Ivy-lane, Paternoster-row.

NEW EDITION.

Now ready, 12s. 6d., cloth.

## Walshe's Practical Treatise on

DISEASES OF THE LUNGS AND HEART, their Symptoms, Treatment, and Physical Diagnosis. By W. H. WALSH, M.D., Professor of the Principles and Practice of Medicine and Clinical Medicine in University College, London.

One Volume. A New Edition, almost re-written, and enlarged by the addition of 200 pages.

"This work is what its name indicates it to be—eminently practical. That it will add largely to the already great reputation of its author, no question can be entertained. It is far in advance of any other Treatise on Diseases of the Chest, either in this or any other country. Every page—we were about to say every line—contains a fact, often new, and always resting on the Author's to say every line—contains a fact, often new, and always resting on the Author's to support every argument adduced in opposition to others. To the practitioner, the clinical teacher, and to the student, this work will prove alike invaluable."—MEDICAL TIMES.

London: Walton and Maberly, Upper Gower-street, and Ivy-lane, Paternoster-row.

# THE BRITISH MEDICAL DIRECTORY FOR 1855.

The Editors respectfully and gratefully acknowledge the receipt of a large number of "Returns" for this Directory.

The Editors have stated on previous occasions, that when the entries in the Directory for the current year (1854) are found to be correct, a mere intimation of that fact will be sufficient; but when alterations are required, they should be distinctly specified, and in all cases the Names should be written *clearly*, and at *full length*.

Lists of the Names of duly-qualified Practitioners resident in the several Cities, Towns, and Villages of the United Kingdom, will be thankfully received, as also information of the Death, Removal, or Appointment to a Public Office, of any duly-qualified Practitioner. In the Metropolis, and other Cities and large Towns, the *streets* and *numbers* of the Houses should be given.

Duly-qualified Practitioners who have already responded to these appeals would confer a favour on the Editors by inducing Professional friends and neighbours to make their "Returns" as quickly as possible, as delays might evidently cause some names to be omitted.

"The BRITISH MEDICAL DIRECTORY, for ENGLAND, WALES and SCOTLAND," to be published on the 1st of January, 1855, may be obtained of all Booksellers and Newsmen, price Six Shillings, (including One Shilling postage.)

OFFICE, 423, STRAND.

## The 16s. Trousers reduced to 14s.—

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

## R. T. Pigram, Practical Tailor, and

Inventor of the Indicator of the Human Figure, whereby a perfect fit is secured, respectfully invites the attention of the public to his mode of art, since none can doubt the importance of an easy and exact adjustment of wearing apparel. Superior Trousers at 17s. 6d. per pair.

R. T. PIGRAM, 51, Lamb's Conduit-street, Foundling Hospital.

## Notice.—Berdoe's Ventilating

WATERPROOF LIGHT OVER-COATS resist any amount of rain, without confining perspiration, the fatal objection to all other waterproofs, air-tight materials being unfit and dangerous for clothing; and, being free from vulgar singularity, are adapted for general use, equally as for rainy weather. Price 46s. and 50s. A large stock for selection, also, of Capes, Shooting Jackets, Ladies' Mantles, Habits, &c.

W. BERDOE, Tailor, &c., 96, New Bond-street, and 69, Cornhill (only).

TO THE NOBILITY, CLERGY, AND GENTRY.

## Walker Babb's Two-Guinea Coats,

One-Guinea Trousers, and Half-Guinea Vests, made from Welsh, Scotch, and Irish Wools, in their pure state. Will stand any wear, and can be worn in any climate. For Fishing and Shooting nothing can equal them. The Black Tweed is well adapted for Clergymen's Riding Trousers. Waterproof Pocket Coats and Capes, Box Coats, Liveries, &c. &c.

D'OLEY'S SCOTCH WOOLLEN WAREHOUSE, 346, Strand, opposite Waterloo-bridge.

## Assistant-Surgeons.—Gentlemen

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS, 28, WEST STRAND, LONDON,

the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, and every necessary information, may be obtained on application.

## Metal Bed-Pan, Price 6s.—Acknow-

ledged to be the most convenient in form, and much more durable than any now in use.

To be had of the Manufacturer, T. LAWRENCE, 20, Great Charlotte-street, Blackfriars; or of Messrs. Gale, Baker, Warde, and Oldfield, Bouverie-street, Fleet-street.

Orders from the Country must be accompanied by a Remittance.

## Gas-heating Apparatus.—H. Mather

begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Gridirons Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 76, GRAY'S-INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

## Do you bruise your Oats yet?—New

Oat-crushers, £2 15s., £4 6s.; Chaff-cutters, £1 7s., £3 7s.; Mangles, £2 10s.; Flour-mills, £4 10s.—WEDLAKE and Co., 118, Fenchurch-street.—One bushel when crushed makes two.

How to Keep a Horse for 9s. a Week; or a Book on Feeding, 1s. 4d.

AT THE CRYSTAL PALACE.

## "The Duobus," a cheap close Carriage

for a "Country Practice," having all the comfort and convenience of a Brougham, with the weight of an ordinary Gig. Price £42. This Carriage can be seen at the new Crystal Palace, and sketch and particulars obtained on application to T. R. Starey, Coachmaker, Nottingham.

## Patent Perambulators.

C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.

OFFICE, 467, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guineas.

CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

## Surgical Instruments, and every

Implement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), Retail as well as Wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

	s.	d.		s.	d.

Best Bleeding Lancets, per dozen					

**Mr. T. H. Wakley's Stricture Instruments.** Complete Sets of these Instruments may now be had of  
WEISS & SON, 62, Strand, London.

**Henry Bigg, 9, St. Thomas's-street,**  
Borough, Surgical Instrument-maker to Guy's and St. Thomas's Hospitals, begs to call the attention of the Medical Profession to the following valuable instruments, made from designs and suggestions kindly given by the Gentlemen whose names are attached—viz., Mr. Le Gros Clark's Talipes Instrument; Mr. Bransby Cooper's Ovarian Trocar; Mr. Cock's Recto-Vesical Trocar; Mr. Cooper Forster's Ear Speculum; Mr. Hilton's Speculum Ani; Dr. Lever's Midwifery Instruments; Mr. Solly's Elastic Catheter, with Catgut Director. These Instruments being constructed on the premises secures their excellence and perfect finish.  
9, St. Thomas's-street, Borough, London.

**New Spinal Support.—Mr. H. Bigg,**  
20, Leicester-square, particularly invites the attention of the Faculty to his newly invented SPINAL APPARATUS, which is constructed on a principle never before employed. It entirely dispenses with cumbersome mechanism, and having a force analogous to muscular motion, allows the body to move freely in every direction. When applied its action resembles the pressure of the hands against the curvature, accompanied by a gentle uplifting of the drooping side.  
It is remarkably light; has a self-adjusting pelvic part; can be applied to every variety of spinal deformity; and arranges itself so perfectly as to escape the closest observation. Patented.  
To be had only of the Patentee, 20, Leicester-square.

TO THE MEDICAL PROFESSION.  
**Fr. G. Ernst, Anatomical Machinist**  
and MANUFACTURER of SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam Ernst (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

**New Spinal Support.—Fr. G. Ernst,**  
Lamb's Conduit-street, Foundling Hospital, begs to draw the attention of the Faculty to his recently-invented SPINAL APPARATUS, which, after some months of trial, has proved superior to any of the various kinds hitherto used, and produced the most satisfactory results. This appliance, being self-adjusting, free bodily motion is permitted; thus, while equal and necessary support is given to the wearer, all injurious or painful pressure is avoided, and a great amount of comfort and benefit consequently yielded. It can be modified so as to suit any FORM OF SPINAL DEFECTION; its weight is comparatively trifling, and from its capacities for nice adaptation elicits no observation when on the body.  
To be had only of the Inventor, 43, Lamb's Conduit-street.

**Huxley's Fulcrum**  
ABDOMINAL BELT will be found, from its mechanical arrangement, (acting diagonally,) and producing the required support for the lower part of the Abdomen, to be the most complete and comfortable arrangement ever invented. It is extremely light, weighing only 4oz. Price 18s.  
Measures required.—Circumference at A, B, and C; depth from A to C.  
A discount of 20 per cent. to the profession.  
HUXLEY and CO., 8, Old Cavendish-street, late of 5, Vere-street, Oxford-street.

**Ladies' Belts.—Bailey's**  
ELASTIC LADIES' BELTS are found to be some of the most useful articles in his establishment. They are worn by those who are delicate in constitution, as they support the Back and Abdominal Muscles, giving the greatest possible comfort before and after Accouchement. They are without Buckles or any incumbrances, and easily adjusted. Prices, 18s., 32s., and 42s.  
Those without Elastic are much used by Surgeons for persons immediately after Accouchement, and called Bailey's Compressing Belts. Price 10s. 6d., 16s., and 26s.  
Hospitals and Lying-in Institutions supplied. Females in attendance, and private rooms for trying on. Elastic Stockings and Knee-caps.  
Address, WM. HUNTLY BAILEY, 418, Oxford-street, London.

**M. Pillischer's Newly-Constructed**  
STUDENT'S MICROSCOPE, which, for solidity, portability, and reasonable price, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7in. by 6in., £5 10s.; or with M. Pillischer's own-made, 1in. of 18 degs. angular aperture, and 4in. of 60 degs., £7.  
The above stand with lever stage, extra eye-piece, double mirrors, animalcule cage, &c., £8; or with Pillischer's glasses, £9 10s.  
A list of prices will be sent free on application to M. Pillischer, 83, New Bond-street.

**Orthopædic Mechanism.—**  
Mr. HEATHER BIGG begs to invite the attention of the Faculty to an entirely new principle he has discovered for constructing the various apparatus for deformities of the Feet, Spine, &c. It combines mechanical power with free muscular action; avoids the least chance of abrasion or suppurations, (so often resulting from the mechanical appliances hitherto used,) and assists in every respect an increase of development.  
Mr. H. Bigg will most gladly show any medical gentleman, who may be interested in the perfection of such contrivances, instruments adapted for Talipes Varus, Valgus, Equinus, Spurious, and Calcaneus; also for Lateral, Posterior, and Anterior Curvatures of the Spine, &c. &c.  
All cumbersome mechanism being dispensed with, the cost is lessened and the weight diminished at least one half.—PATENTED.  
20, LEICESTER-SQUARE.

TO THE SURGICAL AND MEDICAL PROFESSION.  
**W. F. Durroch, late Smith, begs to**  
inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas's-street, (near the Hospital,) in Southwark.  
Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.  
SPECULUM ANI, made by W. Durroch, for John Hilton, Esq., may be had at a moderate price.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.  
**Important Saving, by Pre-payment,**  
in the PURCHASE of  
NEW WHITE MOULDED VIALS.  
APSLEY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—  

1 oz., 1 oz., & 1 1/2 oz. per Gross, 6s.	In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.
2 oz. " 7s.	
3 oz. " 8s.	
4 oz. " 10s.	
6 oz. " 15s.	
8 oz. " 18s.	
4 1/2 oz. graduated in 3 doses 12s. 6d.	

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,  
APSLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

**Purification of Linen.—Prevention of**  
Disease.—J. BOILEVE, 55, King William-street, City, London, solicits the attention of the nobility and gentry to his CALORIFERE, for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.  
From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1853.  
Sir,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) put up in the Laundry at Woburn Abbey in May, 1852, by Mr. Boileve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy. I sent to the Laundry for the man who has the management of it, and he says, that they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.  
I am, Sir, your obedient servant,  
J. Boileve, Esq. J. PALFREMAN, House Steward.

**Cholera Prevented! Rettie's Patents.**  
SELF-ACTING SEWER AND SINK TRAPS, for Streets and Kitchen Sinks, to prevent all effluvia from Drains, Cesspools, and Urinals. Damp Houses cured at Fourpence per day, giving a dry, warm temperature, for sick or invalids.  
PORTABLE CHAMBER CLOSETS, free from all effluvia.  
Orders to E. M. and M. Rettie, 7, Brompton-road. (Enclose Stamp.)  
N.B.—Beware of imitations on the above Patents.

**Ten Thousand Stoves.—The Tenth**  
Thousand of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, and CO., 46, King William-street, London-bridge, and may be obtained of most ironmongers. The Improved Patent Ventilating Stove, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded, post free.

# GREAT REDUCTION IN PRICE OF Sir William Burnett's Disinfecting.

FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d.  
This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 18, Cannon-street, London-bridge.—N.B. Beware of a spurious imitation.

## The Cholera Prevented by the

destruction of all noxious effluvia.  
CREWS'S DISINFECTING FLUID. Recommended by the College of Physicians and the London Board of Health. The cheapest and strongest CHLORIDE OF ZINC.

Quarts, 2s. Pints, 1s.; Half-pints, 6d.—Sold by all Chemists, Druggists, and Shipping Agents, and at Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

## THE MOST CERTAIN PREVENTIVE OF CHOLERA YET DISCOVERED.

FURTHER GREAT REDUCTION IN PRICE.

## Crews's Disinfecting Fluid is the

Best and Cheapest for the Purification of Dwelling-houses, Stables, Dog-kennels, Ships' Holds, Cesspools, Drains, Water-closets, &c.; the Disinfection of Sick Rooms, Clothing, Linen, and for the Prevention of Contagion. The extraordinary power of this Disinfecting and Purifying Agent is now acknowledged, and its use recommended by the College of Physicians. Unlike the action of many other Disinfectants, it destroys all noxious smells, and is itself scentless. The manufacturer, having destroyed a monopoly fostered by the false assumption of the title of a patent, has to warn the public against all spurious imitations. Each Bottle of Crews's Disinfecting Fluid contains a densely concentrated solution of Chloride of Zinc, which may be diluted for use with 200 times its bulk of water. Vide Instructions accompanying each bottle.

It is sold by all Chemists and Shipping Agents in the United Kingdom, in Imperial quarts, at 2s.; in pints, at 1s.; half-pints, at 6d.; and in larger vessels, at 5s. per gallon.

Manufactured at H. G. GRAY'S, Commercial Wharf, Mile-end, London.

Agents: Messrs. Drew, Heyward, and Barron, Bush-lane, Cannon-street, City.

## Tarratt's Bandage and Strengthening

PLASTER.—This Plaster, from the nature of the composition and the material on which it is spread, is adapted for a permanent bandage, as it neither produces irritation of the skin, nor, when applied, does heat cause it to lose its adaptation to the part. Having these qualities, it is peculiarly valuable in the treatment of ulcerated legs, varicose veins, &c., where equal and constant support is required. Several of the most eminent surgeons continue to use this Plaster in their practice, preferring it in certain cases to any other. It is well suited for exportation and use in warm climates, the high temperature having less effect on it than on any other plaster.

The profession are referred to Messrs. Westwoods and Hopkins, Wholesale Druggists, Newgate-street, where the plaster may be had in packets containing three yards, for 2s. 6d., or spread upon skins of chamois leather, at 3s. 6d.

Westwoods and Hopkins also call attention to their Compound Adhesive Plaster for fractures and wounds, as likewise to their concentrated preparations, essences, &c.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lyttæ P.L., easily applied and removed, and will not produce strangury or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR.—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction."

60, Grosvenor-street, London.

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. Brown's BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicator, when carefully applied, and has not been productive of any degree of Strangury.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 43, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

## Drug Price Currents forwarded free

of Postage, on application, by Messrs. HEWLETT and GODDARD, Wholesale Druggists, 6, Arthur-street West, Upper Thames-street, near London Bridge, removed from Hutton-garden; containing the ready Cash Prices for Drugs and Pharmaceutical Preparations of the purest quality. Messrs. H. and G. solicit the attention of the Medical Profession resident in the Provinces, Infirmary Committees, Dispensaries, &c. &c., to the advantages attendant upon the above Price Current.

## The Pulvis Jacobi Verus, prepared

by WILLIAM HOOPER, 24, Russell-street, Covent-garden, from its identity with the more costly preparations, and its acknowledged efficacy as an Antimonial, merits the patronage of those gentlemen who have not hitherto included Pulvis Jacobi in their daily Materia Medica. An extensive continuous demand for Public Institutions has satisfactorily verified the ancient character of this medicine. It is sold in 1 oz. and 4 oz. bottles, at 2s. 9d. and 10s. 6d.; and in packets for transmission by post.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible: also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Cytellodon Umbilicus, &c.); also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alterative), Liq. Parietaria (diuretic), and Liq. Bala (prepared from the Egle Marmelos, or Indian Bael), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BALT on hand.

2, Edward's-street, Portman-square.

## Mathey Caylus' Gluten Capsules

contain the purest Copaliba, either simple or combined with Citrate of Iron, Ratanhy, Cubebs, &c.; acknowledged by the London and Paris Hospitals; also by the Lock Hospital; M. Lesueur, chef de Travaux Chimiques à l'Académie de Médecine; Drs. Ricord, Cullerier, &c., who have granted written attestations, to be the best prepared Medicine for the cure of certain diseases.

Extract of a Letter from Dr. Cullerier:—

"I cannot induce you too much to extend the use of your preparations; by so doing you will render a valuable service to the therapeutic of blenorrhagic affections.

"I am, &c.,

"CULLERIER,

"Chirurgien de l'Hôpital de Lourcine."

Sold in Bottles, at 2s. 9d. and 4s. 6d., sealed and stamped with the Government stamp, bearing the name of the Patentee. To be had wholesale and retail of Robert King, French and English Pharmaceutical Chemist, 21, Princes-street, Hanover-square; and all respectable Chemists in the United Kingdom.—Country agents required.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

FIG. 1. At home from One till Five. FIG. 2.

FIG. 1. MR. BOURJEAUD'S NEW BELT AND AIR-PAD FOR INGUINAL HERNIA.—Mr. Bourjeaud begs to state that the smaller ends of the pyriform air-pads are seen below the inferior margin of the belt. The latter is made of elastic strips, about one inch in breadth, which, by being sewn together in a peculiar manner, effect an equable compression around the abdomen. On the internal and front part of the belt two air-pads are attached, exactly on the spot where the belt comes in contact with the inguinal rings; and these yielding pads exercise a gentle compression upon the rings, which compression may be increased or diminished in changing, by means of a small tube and stopcock, the quantity of air contained in the pads. This apparatus is now driving the steel springs completely out of the field; and Mr. Bourjeaud is happy to say that the hernia belt is getting more and more a favourite among the leading surgeons of the metropolis and the provinces. It is plain to all, that two ends should be kept in view as to apparatus for hernia: first, the support of the intestinal mass; and, secondly, prevention of protrusion through the rings, without giving the patient pain, or causing inflammation and gangrene by pressure on the abdominal parietes with unyielding steel springs. These generally acknowledged desiderata the new belt for hernia completely satisfies; and it becomes every practitioner's duty to advise its use to such of his patients who are affected with hernia.

FIG. 2. POSTERIOR VIEW OF THE HERNIA BELT AND AIR-PAD.—This diagram has been drawn in order to illustrate the latest improvement Mr. Bourjeaud has introduced touching this extremely useful apparatus. It had, namely, been found that, in the sitting posture, the pressure of the air-pads upon the inguinal rings became somewhat weaker; to guard against this change, the tubing attached to the lower margin of the belt and terminating in the air-pad, has been made to swell towards its centre, posteriorly. When the patient sits down, he drives the air contained in this kind of reservoir into the air-pad in front; the latter becomes a little larger, and the slight difference alluded to above is compensated without any effort on the part of the patient. This contrivance gives to the hernia belt a most valuable accuracy.

## New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES—449, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.  
CAPITAL, £100,000.

### TRUSTEES.

SIR JAMES DUKE, Bart., Ald., M.P.  
WILLIAM FERGUSSON, Esq., F.R.S.  
SIR CHARLES HASTINGS, M.D., D.C.L.  
GEORGE JAMES GUTHRIE, Esq., F.R.S.

### DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.  
GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

### MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DULY-QUALIFIED MEDICAL PRACTITIONERS AS THE MEDICAL ADVISERS OF THE COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.  
MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. ON ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES EFFECTED THROUGH THEIR INTERMEDIATION.

### EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and influential AGENTS wanted.

## Engineers' Masonic and Universal

MUTUAL LIFE ASSURANCE SOCIETY, 345, Strand, London.

During the prevalence of Cholera, Policies for three months (renewable, if required, at the expiration of that period) are granted by this Society, covering the risk, not only of Cholera, but of all other diseases. Rates may be obtained at the Office.

Annuitants admitted to a share in the Profits.

No charge for Policy Stamps.

Credit given for half the Premium.

Assignments and Transfers of Policies registered free of charge.

A liberal commission allowed to Solicitors and Agents on the introduction of business.

ANTHONY PECK, M.A., Actuary and Secretary.

## Family Endowment Life Assurance

AND ANNUITY SOCIETY.

12, CHATEAU PLACE, BEAUFORT SQUARE, LONDON.

ESTABLISHED 1835.

CAPITAL, £500,000.

### DIRECTORS.

William Butterworth Bayley, Esq., Chairman.

John Fuller, Esq., Deputy-Chairman.

Lewis Burroughs, Esq.

Robert Bruce Chichester, Esq.

Major Henderson.

Charles Henry Latouche, Esq.

Edward Lee, Esq.

Colonel Ouseley.

Major Turner.

Joshua Walker, Esq.

An Annual Bonus is allowed to parties who have made Five Annual Payments on Policies taken out on the Profit Scale. That for the current year is 20 per cent. in reduction of the Premium.

ENDOWMENTS AND ANNUITIES GRANTED AS USUAL.

### INDIA BRANCH.

The extensive Assurance Business of the Agra and United Service Bank has been transferred to this Office, and the Society has Branch Establishments or Agencies at Calcutta, Madras, Bombay, Agra, and Hong Kong.

JOHN CAXENOVE, Secretary.

## The London and Provincial Medical

PROTECTION and BENEVOLENT SOCIETY, 43, Lincoln's-inn-fields, London. Conducted by a responsible Committee of Medical Practitioners.

### PRESIDENT.

JOHN PROPERT, Esq.

### TRUSTEES.

John Bowling, Esq., Hammersmith.

James Clayton, Esq., Percy-street.

Nathaniel Clifton, Esq., Islington.

Horatio Day, Esq., Isleworth.

J. Probert, Esq., New Cavendish-st.

G. Webster, Esq., M.D., Dulwich.

The objects of this Society are—

1st. To secure the more regular payment for professional services, and to adopt measures for the benefit and advancement of the general interests of medical men.

2nd. To negotiate the Transfer of Practices, Partnerships, and the providing of Assistants and Pupils.

3rd. To establish a fund for benevolent purposes.

Annual Subscription, One Guinea; a firm, consisting of two partners, a Guinea and a Half; a firm of three partners, Two Guineas. No unqualified person can be admitted a Member of the Society.

The Trustees and Committee are responsible for all moneys paid to the Society, and also for the integrity of their agents.

JOHN CAPES, Esq., Secretary-Superintendent.

## Mr. G. Hind, F.R.C.S., resumed his

DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.

Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

## DR. DE JONGH'S

## LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,

AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

*The most effectual Remedy for Consumption, Bronchitis, Asthma, Gout, Chronic Rheumatism, and all Scrofulous Diseases.*

Approved of and recommended by BERZELIUS, LIEBIG, WOEHLER, JONATHAN PEREIRA, FOUQUIER, and numerous other distinguished scientific chemists.

Prescribed by the most eminent physicians, and supplied to the leading Hospitals of Europe.

Specially rewarded with Medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—effecting a cure or alleviating symptoms much more rapidly.

Contains iodine, phosphate of lime, volatile acid, and the elements of the bile—in short, all its most active and essential principles—in larger quantities than the pale oils made in England and Newfoundland, deprived mainly of these by their mode of preparation.

*The following Extracts are selected from some of the leading Medical and Scientific Testimonials in favour of Dr. de Jongh's Cod-liver Oil.*

### BARON LIEBIG,

Professor of Chemistry at the University of Giessen, &c. &c.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use."

### The late

### Dr. JONATHAN PEREIRA,

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this Medicine as yourself, whom I regard as the highest authority on the subject. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

### "THE LANCET,"

(July 29th, 1864.)

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. IN THE PREFERENCE OF THE LIGHT-BROWN OVER THE PALE OIL WE FULLY CONCUR."

"WE HAVE CAREFULLY TESTED A SPECIMEN OF THE LIGHT-BROWN COD-LIVER OIL, PREPARED FOR MEDICAL USE UNDER THE DIRECTION OF DR. DE JONGH, AND OBTAINED FROM THE WHOLESALE AGENTS, MESSRS. ANSAR, HARFORD, AND CO., 77, STRAND. WE FIND IT TO BE GENUINE, AND RICH IN IODINE AND THE ELEMENTS OF BILE."

### "THE MEDICAL TIMES,"

(August 5th, 1864.)

"We believe that the profession are much indebted to Dr. de Jongh for his laborious researches into the composition and properties of this Oil; and we have the high authority of Baron Liebig and the late Dr. Pereira, in testimony of the value of these labours. In his zeal for investigating the properties of the Oil, Dr. de Jongh made a journey to Norway, and carefully examined its varieties, its mode of preparation, and its adulterations."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S stamp and signature, by

## ANSAR, HARFORD, AND CO.,

77, STRAND, LONDON,

Sole Consignees and Agents for the United Kingdom and British Possessions, and may be obtained from respectable Chemists and Druggists in Town and Country, at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... 4s. 9d. | QUARTS ... 9s.

### IMPERIAL MEASURE.

\* Hospitals and other Charitable Institutions requiring large quantities may be supplied on considerably reduced terms.

## OBSERVATIONS

ON THE

GANGLIA AND NERVES OF THE  
UTERUS.

By ROBERT LEE, M.D., F.R.S.,

FELLOW OF THE ROYAL COLLEGE OF PHYSICIANS, LONDON; PHYSICIAN TO  
THE BRITISH LYING-IN HOSPITAL, AND OBSTETRIC PHYSICIAN TO ST.  
GEORGE'S HOSPITAL.

FROM the functions of the uterus, Galen inferred that it must be supplied with nerves; "but they are extremely small," he says, "compared with the size of the organ." He knew that the uterus and bladder were supplied from the great sympathetic and spinal nerves. In 1559, Vesalius stated that small branches of nerves proceed to the neck of the uterus on each side from the sacral nerves, and that the superior part of the uterus receives minute branches of nerves from the great sympathetic. In 1664, Willis had traced the sacral and great sympathetic nerves to the neck of the uterus, and to the bladder and rectum, but no further. In 1672, De Graaf represented, in an engraving, the trunk of a nerve passing on each side into the posterior surface of the neck of the uterus, and ramifying like the branches of a tree over the body and fundus. In 1765, Haller, in the unimpregnated uterus, described nerves accompanying the spermatic vessels to the ovaria, which emanate from the renal plexus; and other nerves supplying the lower part of the uterus, the bladder and vagina, which proceed from the hypogastric and fourth sacral nerves. In 1783, J. G. Walter, in an engraving of the unimpregnated uterus, delineated a few small filaments of nerves passing into the lower part of the orifice and cervix of the uterus from the upper part of a plexus formed by the junction of the hypogastric and sacral nerves. The fundus and body of the uterus were represented in this plate covered with peritoneum, and the spermatic nerves were not delineated. None of these distinguished anatomists appear to have examined the nerves of the gravid uterus, or to have attempted to ascertain by dissection what changes take place in these nerves during pregnancy.

Dr. William Hunter never examined the nerves of the gravid uterus, and once only made a dissection of the nerves of the uterus in the unimpregnated state:—"I cannot take upon me," he observes, "to say what change happens to the system of uterine nerves from utero-gestation, but I suspect them to be enlarged in some proportion as the vessels are. Upon this occasion I profess only to give the anatomy of the gravid uterus; yet since the description of the nerves of the uterus which I have read seems to me unsatisfactory, I shall so far go beyond my subject as to describe the hypogastric nerves, such as they appeared to me in a female subject carefully dissected for that purpose. All the uterine nerves come from the intercostals, and pass in the form of plexuses with the bloodvessels, as in the other abdominal viscera, so that there is a spermatic and a hypogastric plexus of each side attending the vessels of the same name. They are principally the branches of two large cords of the intercostals, which run down before and on each side of the aorta in the abdomen, much in the same manner as the trunks of the intercostals run down upon the sides of and behind that artery. On the left side this large cord comes down from the semilunar ganglion, partly as a continuation of the anterior cord of the intercostal, from that part where it is forming the semilunar ganglion, and partly as a plexus of nervous filaments coming down more forwards from the ganglion itself. This cord passes down below the beginning of the renal artery, all along the side of the aorta. In its way it receives branches from the intercostal, and gives off branches, so that it has the appearance of a plexus, though the principal cord can always be distinguished.

"It gives off the renal plexus, which is situated upon the side of the uppermost vertebra lumborum, and passes to the sinuosity of the kidney, behind the renal vein, but both before and behind and above and below the renal artery.

"Opposite to the third vertebra lumborum, the cord gives off two pretty large branches, and some small filaments of nerves, which run down with and before the spermatic artery. This spermatic plexus may be distinctly traced, with the artery, into the ovum and adjacent parts, at the upper part of the broad ligament.

"Immediately below the origin of the spermatic plexus, No. 1624.

opposite to the same vertebra lumborum, two large branches come from the trunk of the intercostal nerve, in the common direction of their communicating branches—viz., forwards, downwards, and inwards, which join the great cord, and make it large from this conjunction downwards.

"On the right side, the cord comes down from the semilunar ganglion, close to the root of the superior mesenteric plexus and artery, giving a few branches only to the renal plexus, and runs down on the right side of the aorta, as the other on the left.

"And on the right side, the renal plexus, which comes chiefly from the semilunar ganglion as it passes towards the kidney, behind the vena cava and renal vein,—the renal plexus, I say, sends down the spermatic plexus behind the beginning of the renal, which soon joins and passes with the spermatic vessels of this side.

"The two cords, right and left, may be said to constitute a plexus all along the aorta, which makes the basis of the plexuses which accompany the branches of that artery; or they may be considered as the anterior cords of the intercostals in the abdomen.

"At the upper part of the fourth vertebra lumborum, the right cord gives down a considerable branch with the iliac artery, which, branching, forms a kind of sheath-like plexus upon the artery in its way to the groin.

"At the bifurcation of the aorta, the right and left cords unite upon the fore part of the aorta, and make a plexus from that part directly downwards, as far as the lower part of the fifth vertebra lumborum, and then finally divide into what may be called the right and left hypogastric nerve.

"On the right side, a pretty large branch comes from the trunk of the intercostal, on the side of the fourth vertebra lumborum, which, passing downwards and inwards, behind the right iliac artery, joins the plexus of the two united cords before the last vertebra lumborum.

"The hypogastric nerve passes round the side of the pelvis, between the peritoneum and the hypogastric vessels, and upon the inside of the ureter. At the middle of the side of the pelvis, where the hypogastric vessels divide, the nerves split into a double range of branches—viz., anterior and posterior.

"The posterior range goes to the side of the rectum; some branches passing to the back part, and others to the fore part of the gut, and the first and uppermost of these branches are manifestly reflected upwards upon the gut, directing their course towards the colon. The anterior range of branches is the largest, and may be considered as the continuation of the trunk of the hypogastric nerve in the form of a plexus. Where the hypogastric vessels are passing to the side of the uterus and vagina, this nerve, situated behind them, spreads out in branches like the portio dura of the seventh pair, or like the sticks of a fan, with many communications, which are sent to the whole side of the uterus and vagina. The uppermost branches pass upwards in the duplicature of the broad ligament towards the fundus uteri. The branches, as they go to the lower parts of the organ, pass less obliquely, then horizontally, and the lowest of all run downwards on the side of the vagina. The greatest crowd or number of these branches go to the os tines and the adjacent parts of the uterus and vagina."

This was the only dissection of the nerves of the unimpregnated uterus that Dr. Hunter ever made; and never having examined the nerves of the gravid uterus, "I cannot," he observed, "take upon me to say what change happens to the system of uterine nerves from utero-gestation, but I suspect them to be enlarged in proportion to the vessels." From 1794 to 1833, it does not appear that any other attempt was ever made in Great Britain to dissect the nerves either of the unimpregnated or gravid uterus.

John Hunter denied that the nerves of the uterus ever enlarged during pregnancy in the smallest degree. "The uterus in the time of pregnancy," he says, "increases in substance and size, probably fifty times beyond what it naturally is, and yet we find that the nerves of this part are not in the smallest degree increased. This shows that the brain and nerves have nothing to do with the action of a part, while the vessels, which are evident, increase in size; if the same had taken place with the nerves, we should have reasoned from analogy."† Mr. Hunter left no preparations of the nerves, either of the unimpregnated or gravid uterus, to prove the truth of the bold assertion, "that the nerves of this part are not in the smallest degree increased" during utero-gestation.

In 1822, Professor Tiedemann published a description of the

\* An Anatomical Description of the Human Gravid Uterus and its Contents. By William Hunter, M.D. London, 1794. p. 21.

† J. Hunter's Works, vol. III, p. 117. 1887.

nerves of the gravid uterus, but not at the full period of gestation. In the first plate the spermatic nerves, as described by Dr. William Hunter, are represented on both sides accompanying the spermatic arteries to the ovaria. The spermatic veins, and the nerves which follow them, are not exhibited. The uterine arteries are seen running along the posterior surface of the uterus, and anastomosing near the ovaries with the spermatic arteries. The uterine nerves, proceeding from the hypogastric plexuses, are shown accompanying the uterine artery, and spreading out on the posterior surface of the uterus like the branches of a tree, nearly in the same manner as represented by De Graaf. The fundus and body of the uterus down to a line drawn across, a little lower than the ovaria, are represented covered with peritonæum. In the second plate the same parts of the uterus are represented invested with peritonæum. Some small branches proceeding from the superior part of the left hypogastric plexus are exhibited accompanying the uterine artery, and spreading in an arborescent form on the side of the uterus. Several small ganglia are delineated on the nerves proceeding to the uterus, bladder, and vagina, from the hypogastric and spinal nerves. Tiedemann says, "*Ex inferiori parte plexus hypogastrici lateralis plures rami ad cervicem uteri et vaginam descendunt, ibique, cum ramis anterioribus nervi sacralis tertii et quarti conjuncti magnum constituunt plexum, quem hypogastricum lateralem inferiorem nominò. Nervi in plexum ingressi in vera et genuina ganglia intumescunt itaque plexum gangliosum component.*"

In 1823, Professor Lobstein stated that the uterus, before and after conception, had a very scanty supply of nerves. "*Rarissime in uteri substantiam tum vacui tum gravidi sese immittere videntur nervorum surculi.*"

In 1829, Professor Oslander affirmed that the nerves of the human uterus had never been seen either by himself or by any other anatomist, and that he had been deceived by the authority of scientific persons, when he stated that nerves were spread over the whole uterus. "Although it is very probable that the uterus possesses nerves," observes Professor Oslander, "still, hitherto, they have been very unsatisfactorily demonstrated, either as regards their number or their nature. I myself, like others, deceived by the authority of more scientific persons, formerly stated that nerves were spread over the whole of the human uterus, since I believed that more skilful anatomists than myself had really seen them; for example, Walter, who speaks so confidently of nerves which accompany the larger arteries. But I know now that they have not been seen by others any more than by myself, and I can only assume that the uterus, as an irritable organ, must possess nerves. But I have not seen, and it certainly does not possess, any nerves that are easily demonstrable by the scalpel, and, still less, any large branches. But what we have not yet seen may subsequently be discovered: and those who have sufficient opportunities, and the requisite dexterity, to examine pregnant and unimpregnated uteri, should zealously endeavour, by repeated dissections, to discover the uterine nerves; and especially to trace the lumbar and sacral nerves toward the uterus, as it is probable that if nerves do go to the uterus, they, like the arteries, are much larger during pregnancy than those in the unimpregnated condition."

On the 8th of April, 1838, while dissecting a gravid uterus of seven months, which was immersed in alcohol, I distinctly observed the trunk of a large nerve proceeding upward from the cervix to the body of the uterus along with the right uterine vein, and sending off branches in its course to the posterior surface of the uterus, some of which accompanied the ramifications of the vein, and others were inserted into the peritonæum. A broad band, resembling a plexus of nerves, was also noticed extending across the posterior surface of the uterus, and covering the nerve midway between the fundus and the cervix. On the left side the same appearances were seen, and several branches of the nerve accompanying the uterine vein appeared distinctly continuous with branches of the great plexus crossing the body of the uterus. This preparation was placed in the museum of St. George's Hospital on the 1st of October, 1838. H. C. Johnson, Esq., one of the surgeons, was the first anatomist to whom the preparation was shown, who had no doubt that the plexuses were ganglionic nerves. Several eminent anatomists, to whom I subsequently showed the preparation, thought that I had been misled by appearances, and that they were absorbent vessels accompanying the veins and tendinous fibres spread across the posterior surface of the uterus. They, however, all acknowledged that they had never seen nor dissected the nerves of the uterus, either in the human subject or in the lower animals. I resolved, when another opportunity should present itself, to follow the sym-

pathetic into the gravid uterus with the utmost care, that I might discover the nature of the great plexuses covering its surface.

On the 18th of December, 1838, a woman in the sixth month of pregnancy died in St. George's Hospital, a few hours after the fetus and its appendages had been expelled. The uterus was removed with its bloodvessels and nerves remaining connected with it, and the great sympathetic and sacral nerves were carefully traced to the different parts of the uterus while the preparation was covered with alcohol. With forceps and needles all the structures surrounding the nerves were removed, but the neurilemma was preserved entire, this tissue being considered an essential component part of the uterine nerves. Ten months were spent in making this dissection.

In a communication which I made to the Royal Society, and which was read on the 12th of December, 1839, I described the appearances displayed in these dissections, and also represented by drawings the spermatic, hypogastric, and sacral nerves passing into four great plexuses under the peritonæum of the body of the uterus. From the form, colour, vascularity, and general distribution of these plexuses, and from their branches actually coalescing with those of the great sympathetic, I inferred that they were true ganglionic plexuses, and constituted the special nervous system of the gravid uterus. All the eminent anatomists who examined these dissections admitted that the plexuses were accompanied with arteries, and were continuous with the spermatic and hypogastric and spinal nerves. None attempted to show in any other part of the body bands of elastic tissue assuming a similar plexiform appearance, accompanied with arteries, or continuous with undoubted nervous structures.

Mr. Owen and Mr. Kiernan were the referees appointed to examine and report upon the paper as to its fitness for publication in the "Philosophical Transactions." After a very brief examination with the microscope of small portions of the plexuses, under the peritonæum, which had been upwards of a year immersed in strong alcohol, and consequently unfit for such an examination, they decided, in the most positive manner, that they were not nervous plexuses. The evidence furnished by the actual continuity of these structures with the great sympathetic and sacral nerves, their vascularity, and their plexiform appearance, were considered by them of no weight compared with the microscopic appearances. The microscope alone, Mr. Kiernan affirmed, could decide the question whether these structures were or were not nervous. At this time the referees assigned no grounds for their decision, and they were not bound to state any grounds. The verdict was pronounced by the referees in a manner so unhesitating, that, for a short time, I was almost tempted to disbelieve the evidence of my senses, and even to conclude that the most sensitive and powerful muscular organ in the human body had no nerves, and that sensibility and contractile power did not depend upon nervous influence. The phenomena of human parturition, the pains of labour, and the innumerable local and sympathetic affections of the uterus which I daily witnessed, again forced on me the conviction, in spite of this decision which had been so hastily pronounced, (without any grounds being assigned,) that the new structures displayed really were great nervous centres in the uterus, the chief source of its sensitive and contractile powers,—and that the existence might be denied, with equal reason, not only of the whole sympathetic nervous system, but of all the nerves of the human frame. I could not forget that all the different parts of the nervous system, sympathetic and spinal, had been discovered ages before the invention of the microscope, and that such an instrument had never before been employed in similar inquiries, and to throw doubt upon the evidence universally received since anatomy had first been cultivated as a science. The undisputed continuity of the new structures with the sympathetic and spinal nerves, their form, colour, and vascularity, rendered it impossible that they could be bands of elastic tissue, expansions of the peritonæum, or modification of cellular membrane, or any kind of fibrous matter not nervous. If the structures were not ganglia and nerves, then it followed that the uterus had no nerves.

The Committee of Physiology of the Royal Society was first appointed by the Council in 1837, and during twelve years all the papers on Anatomy and Physiology were referred to its members, to examine and report upon them as to their fitness for publication in the "Philosophical Transactions." In the adjudication of Royal Medals in Physiology, and several Copley Medals, the recommendation of this Committee was almost invariably adopted by the Council. By this system the most important duties of the Council were delegated or transferred to this secret Committee. The names of the referees on papers were usually concealed, and the grounds upon which they

decided respecting the rejection or publication of papers were not revealed to their authors, who had no right to request that the grounds might be assigned. In 1839, when my paper "On the Nerves of the Gravid Uterus" was presented to the Royal Society, Sir Astley Cooper was chairman of this Committee, which has now "ceased to reign" at Somerset House.

Before presenting this paper, I requested Sir A. Cooper to examine my dissections, and give an opinion thereon. Sir Astley saw the preparations only once, and in a foggy November morning, with the light of two small tallow candles, in his back kitchen in Conduit-street. In making the dissections, I had found the bright light of the sun in the spring and summer mornings was required, or the condensed light of a powerful Argand lamp when dissection was carried on during the night. Sir Astley admitted without reserve, that the great plexuses at the cervix and on the body of the uterus were continuous with the sympathetic and sacral nerves, and that they had all the characters of ganglia and plexuses of nerves; but he would not admit them to be nervous structures, because he believed in the truth of the unsupported and erroneous assertion of John Hunter, "that the nerves of the uterus never enlarge in the slightest degree during pregnancy," and because Sir Astley thought that nerves never enlarged in any part of the body under any circumstances. He considered the new structures displayed to be expansions of peritonæum and bands of elastic tissue, similar to those which he said he had observed on the surface of the testis, and which for a time he supposed to be nerves. Sir Astley jocularly called the ganglia and nervous plexuses of the uterus "*the cart-ropes and chain-cables*" of the organ. Subsequently several foreign anatomists were sent to look at "the cart-ropes and chain-cables of the uterus," but they all returned to Sir Astley to report that the new structures were undoubtedly ganglia and nerves, and that they had never before seen them displayed by any anatomist in France, Italy, or Germany. Sir Astley entreated me to send no paper on the subject to the Royal Society, and he even felt offended because I did not follow his advice. He, however, in time forgave the offence, and his last words to me, a short time before his death, were—"I shall call upon you very soon, to make up my mind upon *your nerves*, and shall be most happy to be convinced."

On the 20th of October, 1839, Sir B. Brodie, a member of the Committee of Physiology, with Mr. Tatum and Mr. H. C. Johnson, examined the dissections described in the paper, and they had no doubt that the new structures displayed were nervous structures. Two days before, Mr. Caesar Hawkins had expressed the same opinion. Professor Partridge, of King's College, likewise examined the preparations, and the "impression made upon my mind at the time by your demonstrations," he says, "was, that the structures were ganglia and nerves." Professor Owen likewise examined the dissections, and he thought at first the new structures displayed were nervous structures, but he subsequently changed this opinion, and thought they were bands which "corresponded in structure with the fibrous modification of cellular tissue." Mr. Joseph Swan also examined the dissection twice carefully, and expressed his conviction that the structures displayed were nerves; and he thought them so interesting, in a physiological point of view, that an account of them should be sent to the Royal Society, and he consented to write the description. He afterwards changed his opinion, and has since published a treatise to prove that the uterus is very sparingly endowed with nerves, which undergo little change during pregnancy.

The late Professor Mayo, of King's College, likewise a member of the Committee of Physiology, very carefully examined the dissection of the gravid uterus of six months, and he communicated to me in the letter inserted below, his opinion respecting it. Five days after sending this letter he wrote to me the following note:—"Mr. Tomes, the house-surgeon at the Middlesex Hospital, has one of Powell's finest microscopes, and he is himself well known, through his researches on the teeth, as a good microscopical observer. He is likewise well versed in the appearance of nerves in the microscope. I have begged him to be at home at the hospital on Sunday, at half-past one, in the hope that you will be able to meet me there at that hour with your preparation which I examined. If the microscopic examination be satisfactory, no room for doubt will be left. Mr. Tomes assures me that the microscopic characters of the nerves are quite identifiable."

Mr. Tomes examined portions of the ganglionic plexuses under the peritonæum, both of the unimpregnated and gravid uterus, with the microscope, but he declined giving any opinion concerning them. He thought that a lengthened inquiry on recent specimens of nerves was essentially necessary to arrive at a just conclusion respecting the structures displayed in my

dissections. Mr. Tomes has since informed me that at the time he made this microscopic examination of the uterine nerves, he was almost entirely unacquainted with the microscopic characters of nerves, his attention previously having been wholly confined to the structure of teeth and bone. Mr. Mayo was equally unprepared for such a delicate investigation with the microscope, but the same night he requested that his official letter to the Council of the Royal Society should be returned to him, and urged me in the strongest terms not to send the paper to the Royal Society, a recommendation which I could not comply with. Before leaving England he wrote to me expressing the gratification he had received from learning that I had continued the investigation, and that the correctness of his first impressions, as stated in the following letter, had been confirmed:—

"MY DEAR SIR,—Agreeably with your request, I write to you my impression as to the points of anatomical structure displayed in the dissection of an uterus at the sixth month of pregnancy, which you gave me this morning an opportunity of examining. You have made out the existence of a thin band of firm, white, fasciculated substance, of some breadth, situated at the lower and anterior part of the uterus, prolongations of which extend from thence to the round ligaments, into which they are continued by numerous filaments. To the same parts you have traced the production of a smaller narrow band, that is disposed transversely across the middle of the posterior surface of the uterus, and with the fasciculated terminations of which the prolongations of the anterior band are joined by other filaments. These bands adhere firmly to the peritonæum, and filaments pass from them into that membrane. Larger and more numerous filaments pass from them into the fibrous (muscular) structure of the uterus, to which the bands adhere as firmly as to the peritonæum. Filaments of the spermatic nerves are distinctly continuous with some of the filaments existing at the junction of the two bands behind the uterine ends of the Fallopian tubes. Filaments of the lateral uterine nerves are distinctly continuous with the anterior band above-mentioned, and with its productions upon the side of the uterus. Tiedemann has either disregarded or overlooked the structure which you have displayed. I have no doubt that he overlooked it, considering that he has likewise overlooked the large anterior lateral uterine plexuses derived from the hypogastric plexuses and sacral nerves to contribute to the supply of the fibrous (muscular) texture of the uterus, and to coalesce by filaments with the system first mentioned. I am the more surprised that Tiedemann should have overlooked these nerves, as the filaments which he observed and delineated in his plates appear incommensurate with the size of the plexus from which they proceed. His oversight must have arisen from his following those filaments only which go with the uterine arteries; the great branches which you have shown accompany the uterine veins.

"The reasons which suggest themselves against considering the fasciculated bands which you have displayed in the uterus to be parts of the nervous system, are their firmness of texture, and in co-operation with the peritonæum. But neither of these circumstances appear to me equal in weight to the facts of the continuity of filaments of the spermatic and hypogastric nerves with the bands, and of the production of filaments, after the manner of nerves, from the bands into the substance of the uterus—facts which strongly favour the opinion that these bands are nerve plexuses or ganglia, and that they form the special uterine nervous system.

"I am myself inclined to adopt the latter opinion, and believe that I may safely congratulate you on a discovery of great anatomical and physiological interest.

"I remain, dear Sir, yours sincerely,

"HERBERT MAYO.

"19, George-street, Hanover-square, Nov. 24th, 1839."

This letter was enclosed in an envelope, with the following note from Mr. Mayo:—

"I enclose an official note to you, to append, if you think fit, to your paper. If I have made any mistake, tell me, that I may set it right. I have made none in viewing your discovery as genuine, interesting, and important, and calculated to make up your *lee-way* to the honours of a first-rate anatomist."

Sir Charles Bell, when passing through London, on his way to Italy in 1840, saw this dissection, and said: "You have discovered on each side of the neck of the uterus a great nervous centre—a great ganglion—in fact, the brain of the uterus. This ganglion is the centre of all the nerves of the vagina, bladder, rectum, and lower part of the uterus." He said: "It is not a plexus, but a distinct ganglion, which is

situated over the uterine vein on the left side." The arteries running in the plexuses under the peritoneum Sir Charles Bell said demonstrated that they were not bands of elastic tissue, or modifications of cellular substance or fibrous matter."

(To be continued.)

ON

## TRACHEOTOMY IN EPILEPSIA LARYNGEA.

By MARSHALL HALL, M.D., F.R.S., &c.

I now resume the question of the institution of tracheotomy in epilepsy. In doing this, I present to the readers of THE LANCET the results of several years of careful investigation.

I can conscientiously affirm that my hopes of relief in *this direct* of human maladies, from tracheotomy, are more sanguine than ever. I do not, and never did, expect to *cure* epilepsy, and especially epilepsy in its inveterate stages, or with organic lesions, by tracheotomy. I did not expect much from the use of this measure amongst the "incurables" of the lunatic asylum or the workhouse. I did not expect any good results, except by accident, in the cases in which the patient was subjected to tracheotomy without a just and previous *diagnosis*; for it is still necessary to repeat, that it is for laryngismus, spasmodic or paralytic, and its effects, and *not* for epilepsy, any more than for apoplexy, that I have proposed tracheotomy as a remedy.

In a word, I proposed tracheotomy for epilepsy in its *direct* form, short of inveteracy and organic lesion,—in effect, whilst *hope* still remained. I proposed it for that form—that of the *epilepsia laryngea*,—assuredly expecting it to *reduce* it to some other milder *abortive* form; and my hopes have not been disappointed. In one case,—a case in a lunatic asylum, too,—the fits were reduced, by "a moderate and impartial estimate, fifty per cent. in frequency, and seventy-five per cent. in severity," and were "entirely *changed*, there being not the slightest lividity of the face, or frothing of the mouth," &c. &c.

In the next place, I proposed tracheotomy for the paralytic laryngismus which follows the severest attacks of epilepsy instantly endangering life; and by it life has been preserved already in *many* cases, beginning with that of Mr. Cane, and, for the present, ending with that of Dr. Williams, of Wrexham. I say this, notwithstanding the fact that the latter patient died afterwards; for he was rescued from a first danger to succumb to a second and totally different one.

To render the proof of the efficacy of tracheotomy still more complete, it has been observed that the fits have been alighter or more severe, according as the tracheal tube was freely patent, or obstructed by mucus—an event, from its tenacity, very apt to occur. In one case the tracheal tube fell out, the fit was severe, and the patient expired.

The effect of tracheotomy in spasmodic laryngismus is only discovered in the induced absence of fits, or in the mitigated form of the fits which do occur. In paralytic laryngismus it is different; the lividity of the countenance, the distention of the veins, the dyspnea subside *à vue d'œil*; the effect is immediate, and beyond a doubt. The danger is averted; life preserved.

In this case all depends on the early institution of the operation. The laryngismus arises from paralysis of the laryngeal nerves. But other branches of the pneumogastric are paralyzed, and if this condition has long subsisted, the bronchial tubes become clogged with mucus, and the patient dies of bronchial, after having escaped from laryngeal, asphyxia. This was the event in Dr. Herrick's case. It occurs too, undetected, in many cases in which the laryngismus has subsided, and for whom a vain hope is therefore entertained. I visited such a patient many years ago with my friend, Dr. Webster: the fit had passed away, but a diffused bronchial rattle remained, and the patient died of bronchial asphyxia.

I have much to say hereafter on the subject of *irritation*, and of *paralysis* of the pneumogastric nerve in *all* its branches, events still unrecognised by the profession. But I now resume the topic of this paper.

Amongst the questions in regard to epilepsy, two most important ones have never yet been considered: the *first*, what are the precise forms of the *epilepsia trachea*, and what are the *abortive* forms of epilepsy when the effects of laryngismus have been superseded by tracheotomy in the *epilepsia laryngea*?—the *second*, what are the causes and modes of death in epilepsy?

I should conclude that there is usually little danger for mind, limb, or life, in the *epilepsia trachea*, judging from the effects of tracheotomy in mitigating this danger in the cure of

*epilepsia laryngea*. In several cases not only have the complexion and the general appearance and the general health been greatly improved by tracheotomy, but the impaired mind itself has become restored. This was remarkably the case in Mr. Markarsie's, Dr. Neill's, and Dr. Bucknill's patients.

The sources of danger to life in epilepsy are—apoplectic asphyxia and, as in tetanus, exhaustion of the nervous powers—that is, coma, and laryngeal or bronchial asphyxia from paralysis of the pneumogastric nerves, and exhaustion and sinking from the violence and repetition of the attacks.

All these are questions, not for hasty and superficial criticism, but for patient and careful investigation.

And now to the proper subject of this communication.

There are two cases of epilepsy in which, the propriety and efficacy of tracheotomy admit of *no doubt*.

The *first* of these is the *epilepsia laryngea*, of inorganic origin, in its early stage, threatening mind or life, not yet involving organic change; that is, *spasmodic* laryngismus and its effects.

The same remark applies to other convulsive diseases, puerperal convulsion inclusive.

The *second* is, the *epilepsia laryngea*, proceeding to coma and *paralytic* laryngismus or stertor, augmenting the coma and endangering life.

The same remark applies to the coma left by other convulsive diseases, and to all kinds of *simple* apoplexy; that is, apoplexy without lesion or rupture of vessels, deep intoxication, narcotic poisoning, &c.

It may now be well to take a brief retrospect, and consider what has been done.

Of Mr. Cane's case, the first and the most brilliant of all, life was immediately *saved*, and the patient was preserved afterwards—*notwithstanding* some indiscretions, such as occasionally closing the trachea—from his attacks, which had previously occurred on an average five times in a fortnight.

The case of Mr. Anderson was one of the greatest possible inveteracy, and tracheotomy was performed altogether without diagnosis, for epilepsy *not* for laryngismus. Yet was its violence mitigated.

In Dr. Niell's case there was great improvement. On one occasion "he was threatened with an attack, of which he was conscious;" "removed a temporary plug," and "the symptoms disappeared!" "He made arrangements to renew his business; walked about the streets in the confidence and consciousness of a strength of mind and purpose which he had not experienced for a long period."

On another occasion a seizure occurred; the tracheal tube, it is supposed, dropped out, and the patient "died almost instantaneously!"

In Dr. Herrick's case, the convulsions, after recurring every hour or two from three o'clock to nine o'clock P.M., "kept recurring every twenty or thirty minutes; the face and lips were swollen and livid; the breathing much obstructed by mucus, slow and stertorous; the veins of the face and neck much distended." It was concluded that "the patient could not survive an hour unless relieved." Tracheotomy was performed, and followed by "a most marked improvement." "the breathing being more natural, the countenance less livid." On the two following days there were only four convulsions, and these less protracted and severe than any previous to the operation.

Unfortunately, this patient was only relieved. He died on the third day of bronchial asphyxia.

Both Dr. Neill and Dr. Herrick were satisfied with the power of the remedy. The former had to regret its inefficiency, the tracheal tube having been expelled; the latter, its too tardy performance.

Henceforth let us carefully select our cases. Let a just diagnosis be instituted; let there be a fair degree of *hope*; let the disease be *laryngeal*, of sufficient gravity to justify the remedy, but not inveterate, not yet involving organic change.

I conclude by repeating that *there are two cases of epilepsy in its direct forms, in which the PROPRIETY and EFFICACY of tracheotomy admit of no doubt: these are—first, epilepsia laryngea, with spasmodic laryngismus, threatening the extinction of MIND; second, epilepsia laryngea, with paralytic laryngismus, threatening the extinction of LIFE.*

I now propose to add notes of the recent events which have illustrated the use of tracheotomy in epilepsy. These are given in the words of the observers themselves, who have pursued the inquiry.

The first document is a note from Mr. Mackarsie:—

The following simple detail will not fail to interest your readers. It affords a proof of the value of tracheotomy in *epilepsia laryngea*, by contrasting the condition of the

patient before, during, and after the existence of the tracheal opening. Had this orifice been maintained freely patent, it is obvious that the loss of intellect first, and the loss of life next, would humanly speaking have been averted!

The present note completes the account of one of the most interesting of the cases in which tracheotomy has hitherto been performed in epilepsy; and, as the able and judicious writer justly observes,—“there is much that is important to be learnt from it.” There is indeed much to be learnt from the following striking paragraphs:—

“Clay-cross, September 20th, 1854.

“MY DEAR SIR,—For many months I have been anxious to communicate to you the results in my case of epilepsy treated by tracheotomy.

“When I last wrote to you, my patient had a recurrence of fits, but in a much mitigated form; his mind had improved, and his complexion from being of a dusky hue had assumed a natural colour, only remaining perhaps a little paler than natural.

“At this period the tracheal opening was allowed to close through neglect, and the fits resumed the severe form they had had before. I wished to re-open the orifice into the trachea, but was not permitted to do so. I watched my patient with intense interest, and observed him revert to his former condition; the fits became more severe, and the coma more prolonged, the dusky hue of his complexion returned, and his mind again gave way, until at length I found it necessary to remove him to an asylum.

“In this asylum my patient remained a few months, and eventually died from the frequent recurrence of the fits.

“I think there is much of importance to be learnt from this interesting case.

“I shall always consider it a great honour to correspond with you.

“I remain, dear Sir, yours very faithfully,

“To Dr. Marshall Hall.”

“W. J. MACKENZIE.

The second document I adduce is an extract from an able note from Dr. Bucknill, full of the deepest interest:—

“Devon County Lunatic Asylum, Exminster, Sept. 24th, 1854.

“MY DEAR SIR,—“Both cases on which I operated for tracheotomy have died: one of phthisis, the other of epilepsy. The mode of death in the latter was very instructive. It was the second case mentioned in my paper in THE LANCET for August 13th, 1853, p. 138:—

“\* \* \* \* The wonderful change in the character of the fits I have described continued for a period of about nine months. About that time her sister paid her a visit, and they had a quarrel about their mother's will. The day afterwards she was distinctly hysterical, and in the middle of the following night she had severe epileptic convulsions. These continued at intervals of ten minutes for about sixteen hours, when she died from exhaustion, (failure of the heart's action, I suppose,) distinctly not from coma. During the whole of this period, the tracheal opening was quite free, and the large canula was carefully kept clear. During each fit, the external muscles of respiration could be felt in a state of tonic spasm; and it is probable that the diaphragm was also fixed. For a short period in each fit the respiration was completely arrested. I kept the patient sitting in an easy chair, to prevent the accumulation of mucus in the air-tubes.

“I quote from memory, but have the case ready for publication.

“I remain, my dear Sir, yours very truly,

“Dr. Marshall Hall.”

“J. C. BUCKNILL.

I have for some time been investigating the causes of death in convulsive and apoplectic diseases. The case of which a note has been given was evidently one of exhaustion of the *vis nervosa*. In this manner tetanus seems to destroy life. Each successive fit adds to the exhaustion induced by the previous ones, until the patient expires.

If two frogs be affected with strychnism, and one be excited, and the other left in secured tranquillity, the former dies, and the latter survives.

The different forms assumed by epilepsy require to be investigated—the tracheal, the laryngeal, the abortive in cases in which tracheotomy is instituted, the syncopal, and not least, this of nervous exhaustion.

It is difficult to imagine how the respiration can be arrested without closure of the glottis. There are three modes, however, in which this may occur: one is, at a full expiration; the second, at a full inspiration; the third, the muscles of inspiration and the muscles of expiration being simultaneously and equally contracted.

In any such case the *diagnosis* must be established by observing the state of the larynx, of the neck, of the face, and of the cerebrum. In the absence of laryngismus, the deep purple lividity and tumefaction, and the subsequent deep coma, &c., are equally absent, and tracheotomy of course *hors de propos*.

Much observation is still required to complete our knowledge of the forms of epilepsy.

The third document I beg to adduce, is an extract from an able note from Dr. Edwards.

“Grosvenor-street, Cheltenham, Sept. 26th, 1854.

“MY DEAR SIR,— \* \* \* \* The effect of the operation (see THE LANCET of May 28th, 1853,) was *immediate, self-evident, axiomatic, to all present*. Dr. Allardyce expressed his opinion then, and repeated it this morning, that not only were the effects such, but ‘that without it the case must have been utterly hopeless.’ \* \* \* \*

“I may sum up here, that *no fit of any severe character took place in my patient from the moment the tracheal opening was made*, so long as the tube, of whatever kind or form, was kept perfectly clear, and so long as it was kept in the trachea; and that whenever a seizure of a severe character occurred, the tube was found invariably more or less obstructed.

“Slight abortive fits occurred; but these were so dwindled into insignificance, that the patient, having occasionally but a *momentary feeling*, said he was quite well.

“The tube was now removed by the patient. The patient continued well until December, when he became comatose, sank, and died, the history of the attack being wanting.

“Believe me, dear Sir, very faithfully yours,

“CHARLES EDWARDS.”

I have taken the liberty of abbreviating the last paragraph of Dr. Edwards' admirable note.

Dr. Edwards has done great good to the cause by a most important discovery, for which I feel deeply indebted to him. This is to be found in detail in THE LANCET, vol. i. 1853, p. 548. It is, that the tracheal tube, and even the exterior tube when an interior one is withdrawn, is extremely apt to be clogged and obstructed by viscid mucus. A fit may then occur, and be as severe as if the operation had never been performed.

The case requires no commentary. Tracheotomy has saved—mind and life! What can be added to such a statement?

I will now beg your readers' attention to a few short paragraphs, embracing the principles which should guide us in the use of this heroic remedy in epilepsy; they are *five* in number:—

First.—The treatment by tracheotomy should, as in all other cases of the use of important remedies, be founded on an *accurate DIAGNOSIS*; the case should be unequivocally *laryngeal*.

Secondly.—The case should *admit* of REMEDY; it should not have been *organic* in its origin, or have sustained organic change in its progress.

Thirdly.—Not only should there be no organic disease, but the case should not be *inveterate*, even if it be still one of function.

For this reason I do not think the cases already consigned to an asylum or the workhouse can offer much promise of permanent benefit from tracheotomy, or from any mode of treatment. The cases must be of such date as to present *hope*. They must be so severe and threatening in regard to mind or life, as to present sufficient *cause* or *reason* for the operation. It will be readily understood that I do not expect the lunatic asylum or the workhouse often to furnish cases for tracheotomy. The cases in these institutions are generally already *inveterate* or *organic*.

Fourthly.—The tracheal aperture should be *ample*, and be sustained *unequivocally FREE*.

Fifthly.—Our expectations should be reasonable; we should expect to remedy *laryngismus* and its EFFECTS, whatever these may be, and nothing more.

If these five principles guide us, there will be an end of all discreditable controversy; the remedy will have a fair and unprejudiced trial; we shall rejoice if it prove successful, and mourn if it prove a failure.

For myself I have only to say, that I have not, in any case in which tracheotomy has been performed, had the opportunity of forming the diagnosis *for myself*, having never had occasion to witness a paroxysm in any of them. I believe no proper diagnosis has been established in some of them—in Mr. Anderson's, for example. And what shall I say of Dr. Andrea Verga's case? Is it not lamentable to see *such* things brought forward on so grave an occasion?

I fear that that will long be said of tracheotomy in epilepsy which is constantly said of other operations—as that for hernia—that when instituted, it is instituted too tardily, too late. Another observation may be made: I know positively

that the operation has not generally been efficient, for want of an ampler orifice, freely sustained.

Now, let us imagine a youth attacked by epilepsy—by epilepsia laryngea; let us observe that, after a certain number of these attacks, the *mind* begins to fail; that there is incoherence of ideas, loss of memory, &c.; that this state of things is augmenting; that the patient is in danger of becoming a maniac or an idiot; that all other remedies have failed; that *tracheotomy* affords a *HOPE*. Who will hesitate to perform so simple an operation?

Or, let us imagine that, after a severe epileptic attack, the patient remains in a state of coma, his life being obviously endangered, as in the cases of Mr. Cane, Dr. Herrick, Dr. Williams; &c., who will hesitate to avert this danger by performing *tracheotomy*? In *all* these three cases the *danger was so AVERTED!*

I will only add, that as I understand the question better, my hopes of success become more, not less, sanguine. Only let the remedy be instituted in cases perfectly appropriate, after a just and adequate diagnosis, and in a manner perfectly efficient.

September, 1854.

## A SKETCH

OF THE

### PRESENT CONDITION AND TREATMENT

OF

### DISEASES OF THE URINARY AND GENERATIVE ORGANS IN PARIS, COMPARED WITH THOSE IN LONDON.

By WILLIAM ACTON, Esq., M.R.C.S.,

FORMERLY EXTERNE TO THE VENEREAL HOSPITALS OF PARIS.

(Concluded from p. 8.)

#### GNORRHOEA.

It is to be regretted, but still the conscientious surgeon is obliged to admit the fact, that notwithstanding all the improvements that have taken place in the treatment of diseases of the urinary and generative system during the last few years, little progress has been made in the cure of gonorrhoea. It is true that we have in this the nineteenth century a better knowledge than we before possessed of the pathology of the disease, and we have expunged many a vulgar error which was entertained about the complaint; but as to the discovery of a certain rapid cure, we are as far distant from it as ever, and perhaps it is only with a reputation such as Ricord's that a teacher dare make the acknowledgment that, after performing various experiments during a long course of years, no certain plan of cure has been discovered. This, however, is not so surprising to the old practitioner as it is to the tyro, who does not consider the situation the discharge comes from, the frequency with which the disease occurs, the liability of relapse, together with the little attention a patient will pay to the complaint; but, above all, that the urine, loaded with all sorts of stimulating substances, must necessarily pass over the inflamed surfaces many times in the twenty-four hours; and it would almost appear as if gonorrhoea would ever continue to be the *opprobrium medicorum* and the pest of the patient, notwithstanding all the science bestowed upon it. In saying this, however, I would not be understood to mean that gonorrhoea should last an indefinite length of time; far from it, for in 19-20ths of the cases the affection is to be cured readily and easily in persons who will take ordinary precautions; but every now and then cases occur which linger on many weeks, and yield at last to change of air or abstinence from all treatment, the disease apparently wearing itself out.

During the last few years, M. Ricord has been gradually relinquishing the employment of caustic injections in the treatment of this complaint. He still thinks that in many cases this is the treatment attended with the most certain success; but every now and then instances occur in which the pain is very severe, the inflammation runs high, and then, instead of a cure being obtained, the disease relapses into a chronic state, which resists all our means of cure; in addition to this, the patient requires a great deal of watching, more than a surgeon in full practice is able to devote to each individual; so that, as I mentioned above, Ricord now employs caustic injections very rarely, and prefers prescribing capsules, and the following injection:—Sulphate of zinc, acetate of lead, of each fifteen grains; tincture of catechu, one drachm; Sydenham's laudanum, one drachm; rose water, six ounces and a half. My own prac-

tice in London fully bears out this experience, and it is only in old rebellious cases of gleet, in spermatorrhoea, and in chronic affections of the bladder, that I now employ nitrate of silver injections; but in these cases the judicious employment of caustic is of the greatest value, and will at once effect a cure when all other means fail; still, even in these cases, the remedy must be employed with care, otherwise ill consequences will arise.

In the subacute stages of gonorrhoea, when there is no scalding, but a good deal of discharge, I have found the solution of lead answer best in London, together with copaiba capsules, not taken in large numbers, but at repeated intervals, so as to charge the urine constantly with the essential oil; but I still (as in the last edition of my book) continue to insist that gonorrhoea will rarely be rapidly cured, unless the surgeon takes the precaution to show a patient how to use his syringe, and see that the instrument be properly made. Having insisted elsewhere in great length on these points, I do not think it necessary here to revert to them; but to these petty matters I attribute much of my success, and not to any specific treatment. It is, however, worthy of note, that the time of year and the damp weather have a great influence in retarding a cure.

#### GLEET.

Many of my readers, will, I am sure, be glad to hear a few particulars on the treatment which has proved most successful in this obstinate affection. It is not my intention to enter into the various pathological changes chronic discharges from the urethra depend upon, or the indications which should be followed out; suffice it for the few lines I can devote to the subject, to state, that in the more obstinate instances the surgeon meets with, Ricord strongly now recommends the employment of bougies of metal, which possess the curve seen in the adjoining woodcut.

These instruments were brought under the notice of the profession by M. Beniquè, and are of various sizes, each number being a little larger than the other; and although employed by their inventor for the treatment of stricture, are now found very useful in old-standing gleets, where we may suppose the canal has undergone some thickening. The employment of these graduated bougies is then one of the remedies I should recommend, gradually increasing the size; and Ricord's experience seems to bear out the strong recommendation which I gave in the last edition of my work "On Diseases of the Urinary Organs," p. 119, to employ dilatation, accompanied with injections, in the treatment of gleet.

Since the publication of my last edition I have experimented largely with counter-irritation, and I think my success deserves a few moment's consideration. In addition to the means above stated, I am in the habit of recommending my patients to paint the under surface of the urethra with tincture of iodine every night, as well as applying the liquid to the perineum, so as to produce a slight peeling off of the skin. The remedy is then to be left off, and repeated when the skin has regained its cuticle. In the more chronic cases I employ a solution of cantharides dissolved in chloroform,\* with which I paint the skin well in the situation mentioned above. The chloroform evaporates, leaving the cantharidine *in situ*. But as I intend shortly publishing a paper on this subject, I shall not further allude to it here.

#### SWELLED TESTICLE.

Compression of the testis, by means of strapping, has now been nearly given up by M. Ricord, in his hospital; it is, he still admits, an excellent remedy when well applied, but a patient should be seen, in the early stages, twice a day, and the strapping re-applied if necessary. Without watching, this treatment is sometimes accompanied with disagreeable consequences, which aggravate the complaint, at least the French professor thinks so; but in London, in private practice, I have every reason to be satisfied with the treatment, which shortens the duration of the disease very much, and dispenses with the

\* This may be procured at Messrs. Bells', Oxford-street.

usual inconveniences attending these cases. M. Ricord places his principal dependence on leeches, mercurial ointment, and plaster; and, above all, purgatives taken every morning, consisting of aperient salts. In this last recommendation I can bear testimony most fully.

## VARICOCELE.

M. Ricord showed me several cases of varicocele, treated by his instruments, in the progress of cure, and stated, that he never but once had an accident with them, and that arose from his pulling away the ligature too soon, hæmorrhage came on, and, in cutting into the tumour, he found that the silk had failed to divide a small portion of the enclosed parts, and hæmorrhage took place from an arteriole. He added, he has no occasion to publish any ill consequences, they will be known, if they occur, soon enough.

On the question of return of the complaint, he says, he has seen relapses in the practice of others, not in his own. When all the vessels are divided, the complaint cannot return at once, but it may in some cases. In what operation does not this occur? Are we, on such grounds, to defer all operations?

Impotence he has never noticed as a result; on the contrary, the testicle suffers no longer from the stagnation of its blood-vessels, when relieved of the pressure by the operation.

In private practice we are rarely called upon to resort to this operation. Patients generally apply to us early, and then palliative remedies suffice; and in the more advanced stages I do not usually recommend recourse to ligature of the veins, as the patient often would refuse; and experience shows that support of the scrotum, by means of a bandage, strapping the testis, and the constant wearing a varicocele ring, suffices to relieve the most urgent symptoms.

### ON THE TREATMENT OF CHOLERA BY CALOMEL.

By JOSEPH AYRE, M.D., Hull.

SINCE the appearance of my letter in *The Times* newspaper, in correction of an opinion advanced by Dr. Johnson, and of my letter in *THE LANCET*, since reported in a separate form, I have had several letters addressed to me, in which inquiries are made of me on various points relating to the treatment of epidemic cholera, and which it did not fall in my way to notice in either of my letters; and I have now to solicit the favour of having a short space accorded me in *THE LANCET* for the replies which my correspondents desire to receive from me.

Of these inquiries the first in order is the treatment I employ for the premonitory diarrhoea, on which I must observe, that when I first became acquainted with the disease in 1832, I was struck with the close relation which subsisted between the premonitory diarrhoea and the fully developed disease; as the milder one so often passed insensibly into its other and severer form, it became with me a reasonable induction, that they derived their existence from the same morbid cause, and admitted of the same remedy. Assured as I felt to be of the correctness of this conclusion, I at once reduced my views to practice; and as calomel was with me the sole remedy for the cure of the fully developed disease, so I also relied on that medicine for the diarrhoea that might lead into it. In the collapse, as I have many times stated, I gave one or two grains every five or ten minutes, as the intensity and duration of it required; whilst for the premonitory diarrhoea I lessened the size of the dose and still more the times of its repetition. A half grain of calomel given every hour or two hours for five or six successive times, united with a drop or two of laudanum, or with an occasional dose of the compound cretaceous mixture, rarely failed fully to remove the complaint. This practice was pursued by me through the whole of the epidemic of 1832, and on my visits to more than two hundred patients in the true disease. I adopted in that year to a limited degree the house-to-house visitings in the districts where my cholera patients resided. In 1849 the same plan was pursued by a staff of young medical men, who carried the medicines with them; there were 1430 patients thus attended, and only six who were not cured, and with an immediate abatement of the number who were the subjects of the disease before the system of house visiting was adopted.

Another point upon which information appears to be wanted is, as to the required dose of the calomel in respect to its remedial effect upon the disease. By many it seems to be believed that ten or fifteen grains of the medicine exhibited every hour will have an effect equivalent to the dose of two grains every ten minutes, and be less irksome to the nurse and

patient. But on these points I would remark that, however it may seem to be, there is no difficulty in carrying out the treatment by the frequent exhibition of the medicine; for if administered in a small pill, in a dessert-spoonful of water, the thirst of the patients makes them willing, and even impatient, to take it; and as to any other difficulty in regard to the attention demanded of the nurse, it is in no way a consideration to be thought of beyond that of taking the necessary means for obviating it. To the large dose of the calomel there is presented the grave objection, that the purpose of the calomel is not to *promote*, but to *restrain*, the discharge from the bowels, and this the small dose effects, whilst the large dose may become an irritant to the stomach and bowels, and be rejected or ejected from them, and thus defeat its purpose as a remedy. At one period the calomel was placed on the tongue to be thence absorbed, by which to have its mercurial action excited in the system, but this purpose is never attainable in the collapse, and is not to be desired if attainable. Yet so firmly fixed with many has been the opinion that a mercurialization of the system is the effect to be sought for, and that which alone can render the small-dose practice with calomel efficient, that mercurial inunction has been resorted to as most conducive to this object. The failure, however, which so many experienced in their attempt to mercurialize the system, and their disappointment, when it was produced, in not finding it to be a remedy, have led them unhappily to conclude that calomel unabsorbed must prove alike inefficient; whilst others, on the other hand, believing that the calomel would be absorbed, have been alarmed at the consequences which they imagined would ensue from the amount of calomel demanded for the removal of the collapse. All these conclusions, however, are based on the groundless assumption of absorption taking place during the stage of collapse, and when the calomel is only to be given, and in overlooking what I believe to be the fact, that the effect of the calomel is strictly topical, and, in its reduced state to an oxide, is remedial of the specific morbid action present in the bowels, and essentially forming the disease. Be this, however, as it may, certain it is that no absorption of the calomel occurs so long as its exhibition is confined to the stage of collapse, and therefore no evil ever has been or can be produced by its exhibition, however unlimited may be the amount employed.

With some I find it is thought that small doses, repeated at intervals of half an hour, may be sufficient in the collapse when not extreme; but time is everything in the treatment of this disease, whose duration is to be reckoned by minutes, and every hour during which the patient is allowed to remain in collapse increases the difficulty of the recovery, and adds to the risk of consecutive fever succeeding the stage of collapse; and this leads me to observe upon an opinion I find to be entertained, that the fever is essentially a part of the disease, instead of being, as in truth it is, an accidental result of the delayed or imperfect subsidence of the collapse; when the small-dose calomel practice is fairly carried out, and no stimulant or opiate adjuvants united with it, the result will be a direct return to convalescence, or the subsidence of the collapse, with no excitement ensuing. With those who have reported their failure it will be found that their unsuccess has, in too many cases, arisen from their neglecting to persevere in the onward course of the treatment. Dr. Shearman, of Rotherham, in a report sent by that gentleman to *THE LANCET*, relates of a patient in profound collapse, to whom he gave two grains of calomel every ten minutes, that no abatement of the symptoms took place until the end of eight hours, and who nevertheless had persevered until that recovery ensued which past experience had taught him to expect. So long as collapse endures, so long, I beseech your readers to believe, may the exhibition of the calomel be continued; for pending its continuance no absorption of the calomel takes place. And here I must observe upon the use of the term "reaction," as employed very generally to denote the condition which ensues on the removal of the collapse, and which, as implying a state of morbid excitement in the system, is incorrect. In the collapse there is a weakened state of the heart's action, and of the whole arterial system, amounting even to pulselessness at the wrist; and the removal of this state under the calomel treatment is a return of the heart to its normal action, and not to one of excitement. On the subsidence of the cold stage of an intermittent, there is a febrile reaction, but not necessarily so in cholera when the treatment is rightly carried out, and no improper delay or other avoidable hindrances are permitted to obtrude. Out of two hundred patients whom I attended in 1832, I had not more than six or eight I believe who had any fever at all, and with these there were assignable causes for it, which greater attention might have obviated. Besides the exception I have here

made to the term "reaction," I would further remark on a practice so frequently pursued, where the collapse has yielded, and the free action of the heart is restored,—the practice I refer to, and which I cannot too earnestly or importunately advise to be discontinued, is the further exhibition of the calomel at wider intervals after the symptoms of the collapse have disappeared. The calomel is for the collapse, and for no other object, and its exhibition may be suspended or continued at wide intervals so soon as the symptoms of it have exhibited proofs of their being in the course of subsidence. Calomel is wholly useless, if not injurious, if exhibited after the collapse has substantially yielded, and if given beyond this time it will infallibly affect the system, and cause a distressing pytalism. The evil thus wrought is purely a gratuitous one, counter-balanced by no benefit, and only demanding a very moderate care to be prevented. As of the consecutive fever, so also I can affirm of pytalism as resulting from the calomel,—I had not in 1832 more than six or eight patients who became the subjects of it out of more than two hundred who underwent that treatment.

But to proceed. By some of my correspondents the calomel is regarded as a stimulant, and is given as such, and by others as a sedative; but the truth seems to be, that its apparent action as a stimulant is referable to the relief it affords to the depression, and as a sedative by its abating irritation in its action as a remedy to the whole disease. These notions, though unsound, as I believe them to be, have no material effect upon the practice, and differ in this respect from that too prevalent course of treatment in which symptoms are prescribed for. The opiate which I have given is a drop or two of laudanum with the pills for a very limited period, and which I have well nigh abandoned as unnecessary, believing that the cramps, for which inordinate doses of opium used to be given, are best subdued by the remedy which removes the disease. With regard to the several adjuncts, as they are termed by my correspondents, I have ever avoided them as unnecessary, and, as interfering with the action of the calomel, may prove injurious. Amongst these adjuncts as most pernicious is brandy and other diffusible stimulants, unhappily once so much resorted to and depended on. Few of those who have honoured me with their correspondence now employ them; but to those gentlemen, as well as to all of your readers, I would earnestly recommend the utmost observance of simplicity in their use of calomel in this disease; for too often by a mixture of means, (and some of a stimulant or narcotic kind,) symptoms are superadded to those of the disease; and when resorted to, be they harmless or otherwise, they tend but to compromise the conclusions which, in relation to the principal remedy, it is the purpose of the treatment to attain.

In the reports which the Board of Health is seeking to obtain from all engaged in the treatment of the disease, I can but earnestly desire, in regard to the cases purporting to be treated in accordance with the plan advocated by me, that the requirement, in every instance, shall be an account of the precise dose given, and the intervals of its repetition, and the period through which it was continued, with an account of whatever treatment was combined with it; if unaccompanied with these particulars no account can be complete, or deserve to be relied on, and, as in the case of the Report issued under the authority of the College of Physicians, I must claim to have it disallowed. For myself, as not an indifferent looker-on, I would fain renew to the Right Hon. the President of the Board of Health the request I addressed to the Cholera Board of 1832, and, subsequently, to the Board of 1849, to appoint an inspector for this town, who should visit every case where the treatment I advocate was employed, and make a report of each case in respect to its state of intensity, and the results of the treatment employed on it; fully assured the ordeal to which the treatment so often described would be subjected would result in the entire approval of this measure for the treatment of cholera, and in the establishment of its claim to the quality of a specific, and little inferior to that which is assigned to quinine in the cure of intermittents.

Before bringing these somewhat discursive observations to a close, I desire to state, that in testing the efficacy of any mode of treatment in cholera, the trial made of it in an hospital must of necessity be in a considerable degree unsatisfactory. In many cases the attack is so sudden and overpowering, that the patient cannot with safety be undressed. A few such cases I have met with, and one recently, and yet they were nevertheless saved. The distance to which the patients have to be removed, and the time lost in their removal, united with the fatigue and the delay in commencing the treatment, are all so many hindrances to the efficient employment of the remedy. Besides, none of those appliances so profusely and so unprofit-

ably employed in the hospital, and at one time thought to be so needed, are necessary under the calomel treatment. In no case in 1832, or since, have I ever resorted to any of those means, as the hot-air bath, &c., as auxiliary to the treatment, and by which, according to the admission of some who employed them, the sufferings of the patients were increased. The collapse, in fact, is a disease comparatively of short duration; and wretched as were the abodes of many whom I visited in it, there was no extremity of privation, save that of not having a nurse, which precluded recovery; and if the parochial authorities in behalf of the poor were to form a staff of nurses, male and female, each being supplied with a small ten minute sand-glass, and to a liberal pay were to add a gratuity for every patient whom their assiduity assisted to restore, there would be little else required. By these simple arrangements for carrying out the treatment so often advised, and so long and so uninterruptedly pursued by me, I can pledge the assurance for myself, and for all (now happily forming a large number) who have fully and fairly employed it, that so employed, its great efficiency will be manifest; and, taking the unbiased testimony of so many as my warrant, I can further affirm, that no one who has fulfilled the conditions presented for its use will ever desire to relinquish it.

October, 1854.

## SECOND QUARTERLY METEOROLOGICAL REPORT FOR 1854 ON ST. THOMAS'S HOSPITAL.

By ROBERT DUNDAS THOMSON, M.D., F.R.S.L. & E.,  
PROFESSOR OF CHEMISTRY IN ST. THOMAS'S HOSPITAL COLLEGE.

THIS quarter has been characterized by a pretty constant high elevation of the atmospheric pressure. The mean height of the barometer, the cistern of which is placed at 9½ feet above Trinity high-water mark at London-bridge, was 29.901 inches. The lowest reading being 29.132 inches, and the highest 30.532 inches. Notwithstanding this high pressure, the number of rainy days has been great, with the exception of April, when, from the predominating easterly winds, the rainy days were five. Rain fell on fourteen days in May, and on fifteen days in June, with winds from the south-west, the direction from which the return trade-winds, loaded with moisture, are derived. The total rainy days out of ninety-one were thirty-four, or in two months of sixty-one days there were twenty-nine days of rain. The mean temperature of the quarter was 52°·8, or 49°·7 in April, 52°·1 in May, 56°·6 in June. The greatest heat was 79°·4 on the 26th of June, and the lowest point attained by the thermometer was 32°·6 on 25th April. The range of temperature in April, May, June, respectively, was 42°·1, 32°, 35°. The mean weight of water in a cubic foot of air for the quarter was 3.52 grains. The mean temperature of evaporation was 48°·3; the mean dew-point was 42°·2.

Although, during the months of which the meteorological data have been now published in THE LANCET, no influence can be ascribed to the weather as affecting disease, it remains to be seen whether they will throw a ray of light on the subsequent medical history of the year, when the predicted epidemic set in with great virulence. (See Table on opposite page.)

## THE PATHOLOGY OF CHOLERA, AND ITS TREATMENT WITH PURGATIVES.

By JOHN JONES, Esq., M.R.C.S.E., Derby.

THE announcement a few weeks ago of a "new mode of treating cholera" with castor oil as having been successfully adopted by Dr. George Johnson, of King's College Hospital, after having gone the round of the newspapers, and excited an unusual degree of public attention, is now spoken of as a thing that has passed away—an entire failure, and utterly unworthy of confidence. The General Board of Health has subjected it to the test of experiment, and, like most of its predecessors, it has been "found wanting." The movement which it has occasioned, however, has been attended with two results, which, by arousing professional apathy on the subject, might have a beneficial tendency.

1. It proves that the profession is lamentably at a loss respecting the pathology of this formidable disease, and consequently has no fixed principle on which to found its treatment.

2. That purgatives are not such inappropriate means of cure

as might, *a priori*, be supposed, and that the advocates for the purgative treatment need not be taunted, as they have been, with acting on the homœopathic doctrine, *similia similibus curantur*.

That the treatment proposed by Dr. Johnson should have failed, is not surprising; the nauseous and bulky nature of castor oil renders it peculiarly unsuitable in a disease where sickness is a prominent symptom. His pathology is also defective, which leads him to give castor oil for the purpose of assisting nature to eject from the body a supposed poison, which he considers the cause of the disease. In his letter on the subject he makes the following remark:—"I have arrived at the conclusion that those methods of treatment have been attended with the largest amount of success, which have been essentially eliminative in their tendency."

In this opinion I perfectly agree, and firmly believe that the only mode on which we can rationally depend for success will be found, not the castor oil treatment, but a selection of such purgatives as best tend to relieve internal congestions, and thereby restore the impaired organic functions.

Whatever may be the nature of the mysterious agent by which cholera is produced, I believe it to be a disease *emphatically* of congestion. The first symptoms indicate extraordinary depression of the nervous system generally, occurring simultaneously with congestion of the large veins, particularly of the abdominal viscera. The mucous membrane, throughout the whole extent of the intestinal tube, seems deprived of its usual functions of secretion and absorption; the mouth and fauces are no longer supplied with their natural moisture, and unquenchable thirst is the consequence; the mucous secretion of the stomach and alimentary canal is suspended, and seems superseded by a frightful exudation or pouring out of the serum of the blood, constituting the characteristic vomiting and purging; the liver ceases to secrete bile, and the kidneys secrete no urine. The blood, being deprived of its usual proportion of serum, and not being duly oxygenized by the lungs, is found to be "black or dark-coloured, not unlike tar in consistency, thick, ropy, and semi-coagulated." In accordance with this state, we have coldness of the surface, the tongue, and even the breath, together with blueness of the skin. These symptoms of collapse, if not promptly relieved, as is too well known, soon terminate in dissolution.

Strongly impressed with the congestive character of the disease, and believing that purgatives could alone be depended upon for removing this state, I had an opportunity when cholera first appeared in Derby, in the autumn of 1832, of putting my views into practice; and in a paper published in the *London Medical and Physical Journal* for January, 1833, entitled "*Cholera Spasmodica*," are recorded two cases successfully treated with calomel and colocynth, conjoined with external stimulants. In the year 1849, Derby was again thrown into great consternation by a visitation of cholera. On that occasion thirty-two cases were treated and cured by the same means. The symptoms, often preceded by neglected diarrhœa, were sudden and extreme prostration of strength; vomiting and purging; the dejections thin and watery, like urine, or having the appearance of gruel or rice-water; violent cramps; feeble pulse, and general coldness. Some of the patients were in a state of advanced collapse; pulse scarcely perceptible; surface cold as a corpse; breath and tongue cold; features shrunk, and marked blueness of the skin.

These cases were recorded, together with eight others which had occurred occasionally after the epidemic had ceased, in a paper published in the *Provincial Medical and Surgical Journal* for October, 1852, entitled, "*On the Treatment of Cholera by Calomel and Colocynth*," and since that period six others have been treated successfully by the same means, making a total of forty-eight cases.

The following was the mode of treatment adopted:—The abdomen and upper and lower extremities being first well rubbed with turpentine liniment, the patient was immediately wrapped in flannel steeped and wrung out in hot water, over which, and covering the whole body, as if swaddled, was applied a warm, dry, blanket. This fomentation was renewed every two hours, and two of the following pills given immediately, and one repeated every hour, till the motions became feculent and more natural:—calomel, eight grains; compound extract of colocynth, sixteen grains; oil of carraway seeds, three drops, made into eight pills. If the pills were rejected, they were immediately repeated, and occasionally accompanied with brandy, or hot brandy and water; but my chief dependence was upon the purgative pills and external stimulants.

Under this treatment a manifest amelioration of all the symptoms speedily occurred. The vomiting became less urgent; the dejections, instead of becoming more frequent, as might,

*a priori*, be expected as the effect of the purgative pills, became invariably less frequent, less copious, of greater consistency, and in a few hours feculent, and mixed with bile. With this gratifying occurrence, the cramps ceased; thirst no longer urgent; pulse risen; temperature of the skin increased; reaction, accompanied with warm perspiration, became gradually established; the renal secretion was restored, and for the first time perhaps from the commencement of the disease, micturition occurred.

The restoration in most cases was as rapid as the seizure was sudden; and although complete recovery usually quickly occurred, occasionally there was subsequent fever of a low type, which however soon subsided.

The premonitory diarrhœa, if attended with deficiency of bile, the evacuations being thin, watery, and of a light colour, although not having the characteristic appearance of rice-water, is best treated by purgatives.

Dr. J. G. Davey, of Northwoods, near Bristol, who some years ago practised in India, has recorded his testimony in favour of the above mode of treatment in a paper published in *THE LANCET*, May 13th, 1854, in which he states that he had recommended precisely the same practice ten years ago, and that it corresponds with the mode approved of by the medical practitioners in India. By a singular coincidence he recommended the same formula of pills adopted by me. He says—"This pill I direct to be taken every hour or two according to circumstances. Within these few weeks," he adds, "I have had under my care five cases of cholera of the worst description, and in neither was it necessary to give more than five doses of the pills in so quick succession, although it was found indispensable to the entire restoration of the abdominal secretions to repeat them from time to time during two or three days subsequent to the attack."

October, 1854.

#### ROYAL FREE HOSPITAL.

PAINTERS' DROP-WRIST; GOOD AND RAPID EFFECTS OF THE  
IODIDE OF POTASSIUM.

(Under the care of Dr. BRINTON.)

It is now well established that, with certain individuals, the poison of lead will produce some of its most distressing effects, though the handling of the metal or exposure to its influence may be but occasional. We have, amongst others, the case related by Dr. Watson, where a woman had drop-wrist and colic, merely from the accidental circumstance of some cages being painted with green colour in her room. In Dr. Brinton's case, of which we are about to give a rapid sketch, the patient, though not a painter himself, was in the habit of working in the same room with those engaged in the painter's occupation. In such cases the line of sulphuret of lead, described by Dr. Burton, is certainly a very important element of diagnosis.

But when the nature of the disease is made out, it remains to be seen whether we possess therapeutical means adequate to remove and control it. The question may be answered in the affirmative, as cases of perfect recovery are not unfrequently seen; but the means employed have somewhat varied within the last few years, at least so far as the palsy is concerned. Strychnine, the Bath waters, electricity, shampooing, frictions of various kinds, have been successively used with a certain amount of success; but the remedy which has of late proved the most successful is certainly the *iodide of potassium*.

Our readers are aware that M. Melsens (see *British and Foreign Medico-Chirurgical Review*, Jan. 1854) has started the theory that the effects of lead and mercury were caused by

chemical combination with the tissues of the human body, or by being present in intimate union with those tissues in some analogous manner. The therapeutical application of the theory necessarily was, as pointed out by Dr. J. R. Nicholson in this journal, (*THE LANCET*, vol. i. 1854, p. 42,) that the action of the curative agent must be directed to the conversion of the poisonous metal into a compound having less affinity for those tissues, and therefore readily eliminated from the body. M. Melsens has shown that iodide of potassium possesses the requisite conditions to become a curative agent in lead diseases, according to his theory.

Successful cases have been brought forward where mercurial intoxication was controlled by the iodide, and it has also been shown that lead poisoning may be beneficially influenced by the same salt.

Dr. Nicholson, to whom we have above alluded, has published a very interesting case, in which the lead, after the administration of 1090 grains of the iodide, could be readily detected in the urine; but, though the colic had entirely ceased, the palsy persisted. Galvanism was then used in conjunction with the iodide of potassium, and the patient went to his work, about fifty days after the commencement of the treatment, without any trace of paralysis. Dr. Nicholson draws from this case the following conclusions:—

First, that the iodide of potassium acts as a curative agent in lead-poisoning, by converting the lead into a form which can again be readily taken up by the blood, and evacuated by one of the natural outlets.

Secondly, that the iodide acts more speedily in conjunction with galvanism when employed for the relief of lead paralysis.

Now, with respect to the second conclusion, we would refer to a very interesting case, published in this journal, by Dr. Goolden, physician to St. Thomas's Hospital (*THE LANCET*, vol. ii. 1853, page 522.)

The patient had never had colic; had been occupied as a grinder for painters; and both arms, from the shoulder downwards, were perfectly useless, but the legs were less paralyzed. He took five grains, and, subsequently, eight grains, of iodide of potassium, three times a day, for about eight months, and was then discharged, fully capable of writing very legibly, the left hand being, however, slightly dropped.

The salt passed rapidly by the kidneys, and was tested by the addition of a little boiling starch, and a few drops of impure nitric acid, which last is necessary to decompose the hydriodic acid. This gave a deep blue colour. No lead could be found in the urine on the patient's discharge from the hospital.

Galvanic currents were used in this case, and, touching electricity, Dr. Goolden observes:—"I have no doubt that, as the protosulphuret of lead is rendered soluble by the iodide of potassium, it requires the agency of the nervous current to cause the absorption of the poisoned fibre, and the substitution of the new fibre possessing healthy tone and contractility."

We now pass to Dr. Brinton's case, in which no galvanic current was used, and where the effect of the iodide of potassium was more rapid than could have anticipated from the cases which have hitherto been put upon record. It well illustrates the diagnosis and treatment of lead-palsy.

A working-man, who had gradually lost the use of his right arm, applied to a medical gentleman, and was purged and blistered with little effect. On his appearing at the Royal Free Hospital, amongst a crowd of out-patients, Dr. Brinton noticed his pallor, and found that the muscles chiefly affected (the pronators and longer humeral extensors of the wrist) were precisely those most used in the patient's (a carpenter's) usual occupation of planing boards. The shorter extensors were also somewhat affected, though far less than is generally the case in the ordinary painters' wrist-drop. The man had a blue line on the gums. On cross-examination, it turned out that he was constantly at work in the same room with painters, and had never had lead-colic. The existing marked paralysis had lasted several weeks.

It is the marked and rapid result of treatment which forms the most interesting point in connexion with this case. The patient was ordered to take five grains of iodide of potassium thrice daily, and one or two warm baths were enjoined him.

After only one week of this treatment, during which he could not have taken more than two drachms of the above salt, he returned in great exultation, announcing himself cured, and briskly moving his previously almost immovable carpus and metacarpus to confirm his statement.

On close examination, Dr. Brinton could find scarcely a trace of the former paralysis in any of the movements of pronation and extension; and after persuading him to another week's use of the medicine, and cautioning him with respect to cleanliness

and change of dress for the future, was obliged to accede to the man's request, and dismiss him from further attendance.

Dr. Brinton regards the above case as almost unique in respect to the rapidity, completeness, and quantity in which this valuable salt here succeeded. As a rule, he has found the ordinary wrist-drop tedious of cure, even when the iodide has been aided by galvanism, tonics, and generous diet. (See the cases mentioned above.) He entertains a strong opinion, that in these cases the patient, even if resident in any hospital, ought always to be enjoined vigorous bodily exercise in the open air for some hours daily; and he regards friction and moderate use of the paralyzed limb as at least an important adjuvant to galvanism. The latter local remedy he thinks is easily applied in much too powerful a form, so as to fatigue and injure the muscles. It ought never to do more than gently exercise, by a stimulus which, as it replaces that of their poisoned and paralyzed nerves, should obviously find its limits in what we know of the normal effects of over-fatigue on their nutrition.

## ST. MARY'S HOSPITAL.

FRACTURE OF THE FEMUR; NON-CONSOLIDATION OF THE FRAGMENTS; EVENTUAL UNION BY MEANS OF MR. WINCHESTER'S APPARATUS.

(Under the care of Mr. COULSON.)

CONSIDERING the number of fractures which occur amongst the class of persons who usually look to public institutions for relief, we may venture to say that failure of union is rare, if we may judge from our tolerably large experience of the hospitals of this metropolis; and such cases would perhaps be rarer still, if perfect apposition of the fragments were invariably and perseveringly secured.

No doubt but the various apparatuses now in use for keeping broken bones still and in close contact, and for favouring the beautiful reparatory efforts of nature, are very ingenious and mostly effectual; but splints have lately been improved upon, and the starch or plastered bandage used in their stead at the very outset of the treatment. From the cases which we have seen, we are inclined to believe that there are many advantages attending the employment of the starch bandage, according to Seutin's method; the two principal boons being, that the patient may leave his bed in a few days, and that the apposition of the ends of the broken bones is thoroughly ensured.

This practice is largely carried out at two hospitals—University College, and the German Hospital at Dalston; and we propose on some future occasion to enter more fully on some cases treated at these institutions. We would at the present time only remark, that hospitals may realize a great saving by adopting the course we have just alluded to; for patients who have suffered simple fracture may be safely discharged, upon their crutches, about a fortnight after admission.

Much has lately been said on the Continent respecting bandages, made instantaneously hard by plaster of Paris and water; it remains to be seen how far this method may be compared with starch. The latter substance is much employed in all hospitals, after partial consolidation in splints has taken place; but the immediate use of starch was resorted to only in the two we have named above.

Now, it would be interesting to learn whether any cases of non-union have occurred in the hospitals, both at home and abroad, where the starch bandage has been introduced and splints given up; and if there are any, it is plain that less cases of ununited fracture with the starch bandage than with the splints would still be a great recommendation. However this may be, we are bound to say that, in all the cases of ununited fracture which have come before us, the want of permanent and steady apposition of fragments had a large share in the unsuccessful results; therefore all improvements which will tend to obtain proper and secure approximation of the broken bones should be received with favour.

The subject of ununited fracture is certainly worthy of occupying the attention of surgeons, and we have had frequent opportunities, in this department of *THE LANCET*, of referring to cases of this kind, principally to illustrate the practice of the resection of the ends of the fragments, and the use of Dieffenbach's pegs. (See *THE LANCET*, vol. ii. 1850, p. 652; vol. ii. 1851, p. 344; vol. ii. 1852, p. 152, 153, and 154; vol. i. 1854, p. 360; vol. ii. 1854, p. 81.)

On this day, however, we beg to bring forward a case of ununited fracture, (or at least of tardy union,) principally for the sake of introducing to our readers a very ingenious apparatus, invented by Mr. Winchester, and which was employed in the case of fracture of the thigh-bone, under the charge of Mr. Coulson. The particulars of the case are briefly as follow:—

Thomas H—, aged sixty, a carpenter, was admitted into the accident ward of St. Mary's Hospital, April 24th, 1854. On the evening of his admission, whilst under the influence of liquor, the patient fell down three or four steps, and fractured his right thigh about the middle. The limb was shortened by one inch, there was eversion, and the upper fragment tilted forwards, causing a swelling on the anterior and outer part of the thigh. The fracture was reduced, and put up in Desault's long splint, and it was ascertained that the man had on former occasions fractured his *left* thigh, right patella, and several ribs.

May 5th.—Eleven days after the accident the splints were removed and reapplied; the limb being found in a favourable position; but when the splints were again removed, thirteen days after this, (twenty-four days after the fracture,) there was a starting forwards of the upper fragment, and no union of the bone appeared to have been effected. The limb was therefore put up in M'Intyre's splint.

May 29th.—The thigh was examined, and although five weeks had elapsed since the accident took place, not the slightest union has occurred. The upper fragment tilted forwards, and there was great mobility between the fractured ends.

An apparatus, kindly lent by Mr. Winchester, (of which the accompanying engraving is a sketch,) was now applied. Mr. Winchester mentioned having invented it for a severe case of double fracture of the humerus, in which he found it impossible, by the ordinary means, to obtain union, but which after its application was readily effected.

a. The apparatus. b. The slot through which the bandage passes. c. The roller on which the ends are fastened and the bandage winds. d. The ratchet-wheel. e. The stop to prevent unwinding.

The apparatus consists of a grooved plate of sheet-iron, about ten inches long and three broad, with a slot in the centre, and a roller working immediately over, on which the bandage winds. Its object is to prevent displacement by affording the uniform support of a broad bandage, which encircles the limb; the ends are passed through the slot, and fastened to the roller above, which is tightened or loosened at pleasure. In the application of this grooved plate it is necessary to adjust lateral splints of millboard; the external one, over which the apparatus is placed, preventing pinching from the drawing up of the skin against the slot, when the bandage is tightened.

June 6th, forty-two days after the accident, the report says "going on very favourably, not one bad symptom."

The apparatus remained untouched for a fortnight from the time of its application, when it was removed, and the bones found firmly united. It was reapplied for a few days, after which a starch bandage was substituted, and the patient allowed to get out of bed, in order to walk about the ward by the aid of crutches. On June 30th, sixty-six days after the fracture of the bone, the man was discharged cured.

It will be perceived that this is a genuine case of tardy union by want of proper apposition, and not by any inherent inability in the patient's organism to throw out the provisional callus; for as soon as the ends of the bones were, by Mr. Winchester's apparatus, made to come in contact, *in earnest*, union took place. Whether the ingeniously-contrived plate of sheet-iron would answer as well in ununited fracture of long standing we cannot say; but it will at all events be worth while applying it in such cases, after having rubbed the ends of the fragments upon each other, and brought them in close contact.

#### CHARING-CROSS HOSPITAL.

##### ADDITION TO THE CASE OF HYDROPHOBIA.

FOR the convenience of our readers we extract from the *Dublin Medical Press* the case to which we lately alluded, (THE LANCET, Vol. ii. 1854, p. 276.) Dr. Forsyth, of Carrickfergus, relates the case as follows:—

On Thursday, the 27th instant, I was called to visit Master Heywood, an exceedingly fine boy, aged four years. I found

the child lying on the sofa beside his mother, who informed me that he was feverish, evidently unwell, and refused both meat and drink. Pulse 98, weak and irritable, tongue foul, eyes very heavy, bowels costive, skin cool, and respiration natural.

I administered an emetic, which occasioned a discharge of thick mucus, mixed with bile. A short time afterwards I gave him a dose of calomel and scammony, which produced a motion of hard feces. This not being satisfactory, I gave him another dose of the same medicine before he was put to bed. At my visit the next morning, I was informed that the bowels had been slightly moved through the night; that the boy had slept badly, although he had had fifteen drops of tincture of henbane, for composure, and that he refused to take all kinds of drink. The mouth was parched, and the tongue strongly loaded. Before leaving the room I made him take another laxative powder, which in a short time operated satisfactorily, with relief to all the symptoms.

At one o'clock, Dr. Read, of Belfast, visited the patient with me. The latter was sitting on the bed, amusing himself by turning the leaves of a book with pictures. He shook hands with both of us, and appeared almost well.

At my visit in the evening, I heard that the child's bowels were now rather free, on which account I gave him fifteen drops of the solution of morphia, which I happened to have in my pocket. Early the next morning I was called to see him; he was in bed with his father, who said that the child had not slept a wink through the night. The tongue was covered with a brownish crust, his mouth quite dry, and pulse greatly accelerated. Neither food nor drink would he let into his mouth; with a prodigious effort he swallowed a small powder I mixed with sugar and water. I ordered him to have a gentle drive in a car to abate the morbid excitement of his nervous system, and induce sleep without an opiate. At midday visit I heard that he had become very arbitrary in his conduct, and would not suffer a lady, of whom he had been very fond, to go out with him on the car; that his mother was obliged to interpose something to hide from him the sight of the sea; and that he returned to the house rather injured than benefited by the drive. When he heard that I was in the house, he came down stairs, and standing before me, gave me both his hands, and showed me his tongue. He appeared both cool and tranquil. In a moment, however, with the velocity of lightning, he pulled his hands out of mine, struck at my face most violently, spat at me, and kicked at my legs with a violence greater than anything I ever beheld. His looks and manner now left me no doubt of his insanity. All food, drink, and medicine, he absolutely refused.

As the evening advanced the paroxysms of his disease increased in violence; restraint became indispensably necessary, and about ten o'clock Dr. Reid arrived from Belfast.

We put our poor little patient under the influence of chloroform as soon as it was in our power, and he made the most wonderful resistance to its application. Even when he seemed to be composed for a minute or two, the paroxysm of his complaint would rouse him up. A strong anodyne enema was administered before eleven o'clock, which no doubt contributed to tranquillize his system, in conjunction with anæsthetic agency. About two o'clock in the morning he became very quiet; nature was exhausted, and a little before eight o'clock he breathed his last.

About six weeks before the lamentable death of this extremely fine child, he was bitten on the lip and cheek by a dog in the Isle of Man. Caustic had been freely used [the author should have mentioned *which caustic*] as soon as a medical man could be got, and the wounds had been healed for some time before any symptoms of disease appeared.

On the day before I saw him he bathed with reluctance, appeared irritable, and refused to swallow liquids. This state would indicate the commencement of the attack of hydrophobia, which terminated the child's life in the short period of four days.

#### Reviews and Notices of Books.

##### Bethlem Hospital Report, 1854.

DR. HOOD makes it known that in the last year the number of admissions at Bethlem was less than in preceding years—a diminution which he considers partially due to the circumstance that, in the metropolitan district, competition has induced the proprietors of some private asylums to adopt such a reduction of terms as render many of these establishments available to the middle classes of society—persons on the verge of poverty.

who would otherwise require charitable assistance. The discharges and removals in 1853 amounted to 212, of which patients 121 were dismissed cured. The regulation which restricts the residence of patients to one year (with a discretionary extension only to three or six months longer) has a material influence on these relative numbers. The non-restraint system continues to be unreservedly adopted in Bethlem Hospital, and, so far as Dr. Hood's experience has gone, it has, he says, been attended with unequivocal success. He gives illustrative cases in support of his opinion.

The alterations connected with the building, which will admit of a more complete classification of patients, are now nearly finished. Dr. Hood expresses the wish that better means existed for employing criminal lunatics, who are not only capable, but desirous of occupation, and whose industry might be made serviceable to the State, whilst their mental and bodily health would be improved. We learn from the Report, that "no cases of cholera have ever occurred within the walls of Bethlem."

We extract entire the following observations by Dr. Hood:—

"During the last year, in accordance with the announcement which I made in my former report, I delivered, in the hospital, a course of lectures on the Nature and Treatment of Insanity, illustrated by such cases as were then under medical treatment.

"These lectures were delivered during the months of May, June, and July, and I felt much flattered by their reception. Several of our governors did me the honour to attend; and I was much gratified in observing, that many eminent members of our profession favoured me with their presence at the introductory lecture. This year I purpose, under your sanction, delivering a similar course, again illustrating the subject matter referred to in the different lectures by such apposite cases as may then be in the hospital. The study of mental disease is now recognised to be a distinct and legitimate branch of medical science; and the current admission of recent cases into this institution present an ever-varying field for practical observation, which the numerous general hospitals in this metropolis do not profess to command. Here the pupil has the opportunity of studying all the different forms of insanity, and that too in the early state of the disease. Here he may dismiss his book-taught theories, and learn to appreciate the value of facts as they appear visibly before him. The attendance of students at these lectures has not, it appears, since this course was instituted, been so satisfactory as could be desired. My predecessors complained of the small number of those who regularly attended; but it is to be remembered, that the practice of lunacy is a "specialty;" and the pupils attending the London, or other schools of medicine, aim at qualifying themselves for general medical and surgical practice, and so much information is required to enable them to pass the stringent examinations which they have to undergo at the different halls and colleges, that many of them cannot afford time to follow up any of the collateral branches of this science."

The courses of lectures on Mental Disease delivered in this country are so few, that we think it highly desirable to give publicity to the above announcement.

*Notes on Spa and its Chalybeate Springs.* By THOMAS CUTLER, M.D., formerly Lecturer in the Blenheim-street School of Medicine, London, &c. &c., and now Resident Physician at Spa, Brussels and Ghent. 1854. pp. 122. New and Revised Edition.

In 1849, Dr. Cutler, in compliment to the beauty and virtues of his place of voluntary expatriation, and at the request of many patients and of the principal inhabitants of the place, published the first edition of his "Notes on Spa." It was quite natural that the springs of the valley of Wahai should meet with high laudation at our author's hands; but considering that Spa is really beautifully situated in the province of Liege, close to a lovely neighbourhood, where

"Ardennes waves above them her green leaves,  
Dewy with Nature's tear-drops as they pass,"—

provided with some of the purest chalybeate springs of Europe, and, moreover, owning "fifteen to twenty couples of stout-

working harriers," hunting a country something like Dartmoor, consisting mostly of heath, with some cultivated country, but no fencing,"—it cannot be wondered at that our author should find much to say in its recommendation and favour. The second edition, now before us, is an improvement on its predecessor, and may be well recommended to the notice of such as intend either *drinking or hunting at Spa*.

*A Discourse on Medical Botany.* By Earl STANHOPE, being the Substance of unpublished Addresses, delivered by him to the Medico-Botanical Society, of which he was President. London. 1854. pp. 47.

DISCURSIVE Memoranda, interesting alike to the naturalist, pharmacist, and clinical practitioner.

### WEAR AND TEAR.

THE effect of heat is living too fast, the effect of stimulants is living too fast, the effect of overwork is living too fast, and the effect of living too fast is premature decay and early death. .... European fruit-trees transported to the tropics are proverbially prolific in the amount of their leafy productions, two or three crops in one year, but there is a lamentable paucity in the amount of fruit, and the natural period of their lives is much curtailed. That unfortunate bird, the Strasburg goose, affords an apt elucidation of the effect of diminished respiratory powers and the large consumption of food, composed of hydrogen and carbon, on the liver. By warmth and inactivity its respiration is reduced to a very low degree, and at the same time it is fed on materials containing a very large amount of oleaginous matter. The consequence is, that the liver is stimulated to exertion; it hypertrophies from work; like the muscles of a blacksmith's arm, it gets no rest, but goes on working like a mill-horse, to try and get rid of the large amount of carbon in the system; but it is unable to accomplish the Herculean task required of it, and its cells become gorged with hydro-carbon in the shape of oil particles, and the mass of disease is the delightful dish in which epicures luxuriate under the designation, *Pâté de foie gras*. The effect of over-taxation in the amount of work may be seen every day in the battered limbs and broken constitution of race-horses, and the rapid destruction of eye-sight in those engaged in very fine work is proverbial. A watchmaker employed his time in writing the Lord's Prayer on a space about the size of the wing of a fly, in which all the t's were crossed and all the i's dotted; while so engaged he worked in a bright light; it occupied him about a fortnight, but in that short time his sight aged thirty years.—Mr. CAMPBELL in *Indian Annals of Medical Science*.

### TREATMENT OF ANEURISM.

Judging from a very careful review of the subject, and especially from the facts adduced by Norris, Velpeau, and Erichsen, it appears extremely doubtful whether attempts to cure aneurisms of the brachio-cephalic trunk by ligature of the right carotid or sub-clavian are in the least degree justified by experience. The generality of aneurisms of the innominate originate from the aorta. I find that out of forty-five cases collected by Dr. Holland, the aorta was observed to be diseased in twenty-three, and was stated to be healthy in six only; and it is to be observed that wherever the upper portion of the innominate yields first, the aorta is always liable to become secondarily involved.—Dr. CHEVERS in *Indian Annals*.

### INDIAN PLAGUE.

1st. "Mahamurre" and plague are identical.—2nd. The disease is of local origin, capable of transmission from person to person and from place to place.—3rd. It is gradually extending itself, and no sufficient grounds exist for the supposition that it will never be developed in surrounding countries.—4th. The local circumstances upon which "Mahamurre" depends should be done away with, and sanitary measures introduced, in which case it is probable that the disease will be gradually eradicated, or at any rate modified in severity.—5th. It is likely the disease, if dealt with early, will be found to be curable, and that the people themselves may use the remedies furnished by authority.—*Report on Mahamurre, or Indian Plague, by Drs. FRARSON and FRANCIS*.

# THE LANCET.

LONDON: SATURDAY, OCTOBER 14, 1954.

WHEN the pestilence now oppressing the land shall have passed away; when those who are specially charged with the duty of watching over the physical welfare of the people—with which every question of social and moral improvement is indissolubly linked,—shall turn back their attention to the philosophical consideration of the calamities out of which the country may have emerged for a time, and review the machinery that was relied upon in order to avert or to mitigate those calamities, it will be a matter for humiliation and regret to find that, in a country where science is diligently cultivated; where philanthropy is so active and abundant as to be ever seeking out objects whereon to exert itself; where the art of political administration is certainly not at the lowest ebb, neither science, nor philanthropy, nor the art of political administration, has been adequately directed to the attainment of an object which it is in the highest degree unsafe and unwise to neglect. If all has not been exactly left to chance, it certainly cannot be said that any complete or operative scheme has been provided by the Law for an efficient counteraction of the causes of disease. On every side may be seen bodies and individuals, animated by counteracting influences, some of them sometimes accidentally right; some of them perversely wrong; sometimes effecting a partial good in a circumscribed locality, not seldom at the cost of their neighbours; but all of them moving upon separate fortuitous impulses, and with peculiar objects, and all, consequently, concurring in the production of confusion, in mutual neutralization, and in the necessary failure in attaining the only object of universal interest, the health of all. Anything more clumsy, more absurd, or more inefficient than our present chaotic sanitary machinery, it is impossible to conceive. Its absurdity is the more gross, and its inefficiency the more shameful, because we undoubtedly possess all the materials, all the elements, for a good and comprehensive organization that shall be equal to the need. All that is wanted is to arrange those materials; to define the functions of each; to inform the newly-organized body with one intelligent and guiding spirit; and to confer upon it adequate powers of action. In no other way can we reasonably hope for success in an undertaking which requires that all the resources of science, all the zeal of public spirit, and all the appliances of administrative talent, should be steadily, consistently, and harmoniously directed to the object before us.

Let us glance at the *disiecta membra* of our sanitary forces. Under the Poor-Law Amendment Act, we possess the largest and most widely-extending machinery for the care of the public health. Under this Act, and in immediate and degrading subjection to the local Boards of Guardians throughout a portion of the empire, we possess a body of medical practitioners equal, by their zeal, their intelligence, and their professional acquirements, to the highest sanitary duties. Under the galling, parsimonious, and narrow-minded policy that but too often rules the councils of the Boards of Guardians, the medical officers are jealously restricted to the simple duty of treating the sick and wounded whom pauperism has brought within the jurisdiction of the Poor-Law. Men whose knowledge and whose

skill might be made available for the higher purpose of guarding the population against the approach of pestilence, and of preventing the desolation of communities by epidemics, are condemned to waste their energies in combating every case of disease in detail—disease which a wise foresight might perhaps have averted altogether. Under the present wretched system of petty and isolated sectional interests, it is impossible that any large measures for the general good can be carried out. It is unreasonable to expect that the economical minds of Boards of Guardians will ever compass the great truth, that it is cheaper to prevent disease from paralyzing and impoverishing a community than to resist it in detail. It is vain to demonstrate to men who are only intent upon reducing the poor-rates of a district, that it is the truest national, if not also the truest parochial economy, to expend money in removing all known causes of disease, and in opposing epidemics whilst still hovering at a distance. It is a hopeless task to urge upon such men that a blow may be parried by timely vigilance, which, if inflicted, all the skill of the surgeon cannot remedy. How often has it been proved, with all the force of argument and all the certainty of experience, that more people die every year of zymotic—or to a great extent, preventable—diseases than from sporadic or ordinary diseases, affecting individuals only? Shall we still and for ever go on enforcing plain and incontrovertible laws upon persons whose mental perceptions are hopelessly obscured by interest and prejudice? Where conviction is hopeless, reform is impossible. Shall we still and for ever abandon the most valuable possession of the poor man, that out of which all other possessions, moral and physical, proceed—his health—to the care of a system designed for another purpose, and that purpose one that too often leads the administrators to disregard every other consideration, howsoever important? Shall we perpetuate the folly to which the public health has long been sacrificed, of maintaining the authority of the Boards of Guardians in a matter essentially distinct, and only accidentally and arbitrarily associated with their proper function, the relief of the poor? Upon what principle can it be contended that those whose special province it is to take care of the paupers of a district, should be empowered not only to extend their jurisdiction over the sanitary interests of all classes of the community, but even to oppose and render nugatory the best-directed measures of others? Surely such a power it was never intended to commit to Boards of Guardians. It was surely not contemplated by the framers of the Poor-law Amendment Act, or at least by the Legislature, that any particular local Board should be in a position to nurse a pestilence, to give concentration to an epidemic, by defying, as the parochial authorities of Clerkenwell have lately done, the earnest injunctions of the Board of Health. To maintain such a proposition, is to maintain nothing less than that any Board of Guardians has the right to lend virulence to epidemic disease which may, after afflicting the district over which it rules, spread far beyond the parish boundaries, destroying and desolating the community at large.

If the charge of the public health be one absolutely incompatible with the particular duties of Poor-Law Guardians, and a charge which they have plainly usurped, it may be safely inferred that bodies constituted as Boards of Guardians are could not undertake the momentous charge without inflicting the deepest injury upon the public. What is the rule of action of these bodies in matters concerning health? A Board of Guardians pledged, above all things, including honour and the

public good, to a scrupulous and searching frugality, is called upon to appoint a medical officer. The merit that excels all other merit in a candidate, is willingness to undertake the greatest amount of work for the smallest amount of pay. A contract is entered upon, by which the medical officer is bound to attend to the sick poor who may "come upon the pariah." If he exceeds his specified duty by administering aid to others, no matter how great the emergency, in a private or public point of view, the probability is that he will be reprimanded by the Board, and refused all remuneration. When an epidemic threatens, so long as it only threatens, the Board is quiescent: nuisances accumulate; the materials which furnish the food of pestilence are recklessly or supinely tolerated; the health-destroying miasm is suffered to depress the vital energy of the inhabitants; but the rates, they congratulate themselves, are diligently kept under. When the epidemic has invaded the district, a fitful activity, prompted by fear, but ever narrowly controlled by the spirit of parsimony, is exhibited. But short-sighted parsimony is far remote from the wise prescience of true economy. The opportunity of *prevention* has gone by; and all the cost of actual disease, that paralyses productive labour, that spreads pauperism, and creates new burthens upon the poor-rates, has to be encountered. And how is it encountered? The weight of the emergency falls with overwhelming pressure upon the medical officer, who, absorbed in the urgent duty of tending the sick, has no time to devise or to carry out general measures for the preservation of the healthy. The community is thus left without counsel, and power of self-help is equally denied. The Guardians, on their part, perhaps, display a bustling activity in abating nuisances which had sprung up and acquired a footing through their own tolerance in times when danger was at a distance. The activity is developed too late either to save money or to stay the pestilence. The disease rages till its poison is spent. Guardians, bemoaning the past loss, still find means to retrench where utmost parsimony already prevailed. Nuisances return; noxious trades, suppressed for the moment, are resumed; filth and sloth recover their sway; the soil, the air, the water, the enervated human frame, quickly return to those conditions that engender or invite disease, and give it lethal power.

Let those who may be inclined to question the truth of this picture look to the history of the present epidemic. Instances abound.

Such, then, is the actual fruit of the present system, which surrenders the care of the public health to those whom the law only intended to entrust with the care of the poor. It may be asked, Can we cherish the hope that better results may be achieved by improving that system? May not the Boards of Guardians be brought to entertain a juster sense of the responsibility they have assumed? We believe no such hope can be reasonably entertained. Local Boards will ever be influenced by local considerations; and the public health is a national possession, that cannot be safely abandoned to the uncertain efforts of isolated local administrations.

But more than this. It will not be disputed, that in any comprehensive scheme of sanitary administration, the necessity of securing the confidence and co-operation of the medical practitioners throughout the country must be borne in mind. Nothing has been more clearly proved than the fact, that no confidence subsists or can subsist between the medical profession and the Boards of Guardians. The grievances long endured by the union surgeons have attained to such a height

that, in the last session of Parliament, a committee was appointed for the purpose of inquiring into the subject; and this was after the late Sir ROBERT PEEL had made an imperfect attempt to release them from too absolute a dependence upon the Guardians, by transferring half their salaries to the Consolidated Fund. One universal feeling of dissatisfaction with their present subjection to the Boards of Guardians prevails throughout the profession. That subjection cannot long be continued. The question that presses for speedy solution is, how best to bring together under a new organization the medical practitioners of the country, so as to secure their services in the great duty of preserving the public health?

The medical practitioners will, we are well assured, be found able and ready volunteers for the sanitary service of the country. What is wanted is an organization, and a guiding authority, invested with adequate powers. The guiding authority already exists. Adequate powers of action the Legislature must confer; and amongst these powers, one of the first and most essential must be the association of the union medical officers, under the new character of Officers of the Public Health, with the General Board of Health. It is obvious to every one that no general measures, having for their object the preservation of the health of the community, can emanate from the Poor-Law Board, which neither possesses the necessary powers, nor can reasonably claim to have such powers conferred upon it. It is also obvious that a Board, specially constituted for the administration of the Poor-Law, and possessing no member of the medical profession, could neither be expected to devise proper scientific measures, nor to obtain the confidence of medical practitioners. The General Board of Health, on the other hand, must be acknowledged to be the most natural and fitting head of the new department of State-Medicine. Its able President has already given proof of great energy and admirable administrative abilities. He has associated with himself a Council of Health, selected so impartially as to challenge the respect and goodwill of the profession. He wants not the will nor the ability to raise his department to the highest point of efficiency and public utility: he wants the power and the means.

No one imagines that the duties of the Board of Health begin and end with periodical struggles against the Cholera. That dire disease, although it has already in the present epidemic, destroyed more lives, and entailed a greater pecuniary loss on the country, than the war in the East, is but one of the many diseases against which we have to combat. The care of the public health demands constant watching and constant exertion. But no watching, however skilful, and no exertion, however zealous, can be efficient, unless there exist the power of carrying into practical operation the measures which science may indicate.

COMPLAINTS continue to reach us of the terribly defective condition of our medical staff in the army and ships of the Crimea, and our fleet in the Baltic. Whilst our gallant allies, the French, after the great battle of the Alma, had abundance of medical officers, and proper means of conveyance for the wounded, the English army was lamentably deficient in both. How many lives have been sacrificed for want of proper arrangement and neglect, it would be difficult to determine; but the authorities cannot urge in extenuation that they had not timely warning of the evils which were likely to result from their supineness.

is fervently to be hoped that immediate steps will be taken to remedy the evil. So long, however, as the insulting and absurd regulations respecting assistant-surgeons in the navy remain in force, so long will good men refuse to serve, and so long will there be a deficiency of proper medical officers in our ships of battle. Should any great event occur at sea, we shudder at the condition in which our poor wounded seamen must be placed, in the absence of that complete staff of medical officers, for whose assistance they have a right to look in the hour of pain and suffering.

THE Inspectors of the Board of Health are dismissed for the present. We believe the interests of the public have been well served by these gentlemen, but we regret that the niggardly sum placed at the disposal of the Board should render it necessary to dismiss them at the very time when their services might be most valuable, by the knowledge they must have obtained of their respective districts. We cannot attribute any blame to the President, whose anxiety to promote the cause entrusted to him has been obvious. We trust that the reports of these gentlemen, by pointing out the errors and shortcomings of our present legislation in regard to the Public Health, may lead to the bringing forward of a measure calculated to advance this great sanitary cause.

#### THE ACID TREATMENT OF CHOLERA.

To the Editor of THE LANCET.

SIR,—My name having been several times alluded to in your journal in connexion with the question of the treatment of cholera by acids, and particularly by Mr. C. E. Hatherly, in THE LANCET of September 30th, I beg to offer a few words by way of explanation. I have stated that I was the author of a pamphlet on the subject, written many years since, and I have to regret that I had long wholly lost sight of it, and could not in fact produce it. I advertised for it in a Birmingham newspaper, but failed to obtain a copy through that means. Recollecting that a gentleman now residing at Nottingham was in the establishment of Mr. Hammond, (who published it,) in Birmingham, as an apprentice at the time, I wrote to him, and he referred me to Mr. Stowell, of Temple-street, Birmingham, who printed it. On referring to Mr. Stowell, that gentleman at first declared that he did not think he could produce a copy, as their rule was to destroy, after a few months, all such productions. He, however, desired his man, who was present, to look into a drawer which was at his feet, as he said he sometimes put an odd copy of pamphlets there. He took up two or three, and then exclaimed, "Here it is." There it had lain undisturbed for twenty-three years. Mr. Stowell, gave me the copy, and I have written a short preface, and Mr. Stowell will shortly reissue a second edition of the pamphlet. On perusing it I find it advocates the use of mineral and vegetable acids, acetate of lead, &c. It is condemnatory of calomel and bleeding, which was in vogue at that time, and also of stimulants, &c. But whenever I have alluded to the subject since, quoting my own pamphlet from memory, I find I have made some blunders. For instance, it was published in 1831, and not in 1832 or 1833. I had also forgotten that it was published anonymously, and that it was addressed to the Central Board of Health of that date, and they no doubt possessed, or do possess, a "Copy." I also, in giving a formula as from my own pamphlet, was inaccurate as to some of the items, but not at all as to the general principle. There is a letter, with the signature B, in the *Morning Post* of September 21st, 1849, headed, "Causes of Cholera," which I wrote, and wherein I have endeavoured to show the rationale of the treatment by acids, and also broached the opinion, that the utility of calomel in cholera arose from its chlorine. I do not wish to advocate the practice of writing on medical subjects in other than medical journals, but only allude to the subject

now in support of my opinions. It was only when I observed parties making statements in your journal, of their having first suggested the treatment by acids, that I wrote to you, Sir, in my own name, in vindication of my prior claim. Previously I had written anonymously, which clearly shows I had no personal object in the matter, further than a wish to extend a practice which I strongly felt to be of great public interest. I also once wrote to the College of Physicians, in answer to a public call of theirs, strongly urging the practice in question. You have expressed a wish to see my pamphlet; I shall have pleasure in forwarding you a copy, so soon as the new edition issues from the press, and allow me to say, that whatever censure or credit your readers may award me with respect to this subject, I trust, in either case, to endure with due humility and patience; and if some errors have occurred, through a defective memory on my part, it should be known that the current of my thoughts has been directed mainly to other subjects in another channel since the publication of my pamphlet in 1831.

I am, Sir, your obedient humble servant,

GEORGE BODINGTON.

Button Coldfield, near Birmingham, October, 1854.

#### THE TREATMENT OF CLUB FEET.

[LETTER FROM MR. LONSDALE.]

To the Editor of THE LANCET.

SIR,—My attention has been directed to the introductory lecture delivered by Mr. Solly at the opening of the St. Thomas's School, published in the last number of your journal, in which he refers to the treatment of club feet, (talipes varus,) and for which he recommends the excision of the os cuboides as greatly facilitating the cure of the severest forms of this deformity.\* I must say that I am much surprised to find him laying such great stress upon this operation, and fear that his advocacy of it (for such it amounts to) may induce others, who have had but little experience in this branch of surgery, to follow his example, and to repeat it.

My object in addressing these few lines to your journal is to record my total disapprobation of this mode of treatment, as being quite uncalled for, and therefore unnecessary. I have now been connected with the Royal Orthopaedic Hospital for upwards of ten years, during which period I have seen some hundreds of cases of club feet, and many of them the severest forms of varus, not only in children, but in adults. These have been treated by my colleagues and myself, and they have all yielded to proper mechanical treatment, patiently persevered in after the division of the tendons, without the necessity of having recourse to (what appears to me) so serious and unscientific an operation as the excision of the cuboides bone.

In thus entering my protest against the operation, my only wish is to assert that the branch of orthopaedic surgery is capable of being followed out successfully by a simple and harmless mode of treatment, instead of having recourse to one that is quite unnecessary, and at the same time dangerous. I make this assertion boldly, Sir, founded on my own experience.

I have the honour to remain, Sir,

Your obedient servant,

EDWARD F. LONSDALE,

Surgeon to the Royal Orthopaedic Hospital.

Montague-street, Russell-square,  
October, 1854.

#### PREMONITORY SYMPTOMS OF CHOLERA.

To the Editor of THE LANCET.

SIR,—The profession ought to be extremely obliged to Dr. Oliver for having published his two cases of cholera, which appeared in THE LANCET of the 7th instant, and which so fully prove the pathological fact, that cholera cannot occur without a premonitory diarrhoea.

In these two cases, when he saw them, the evacuations, he tells us, were what is called "rice-water;" and as he says nothing of the presence of any fecal matter, we must conclude that there was none.

Every one is aware that there is always, in health, fecal matter in the colon and rectum, and that no one in his senses can suppose that that fecal matter can, by any disease which may supervene, be turned to serous fluid, and be passed off as "rice-water" evacuations.

\* I believe this was first recommended by Dr. Little. I remember having a conversation with him upon the subject two or three years ago.

Consequently, wherever the evacuations are what are called "rice-water," the person must have had repeated evacuations from his bowels, which have carried off the fecal matter.

As the question, whether there is or there is not a premonitory diarrhoea in every case of cholera, can only be settled by facts collected at the bed-side, and not by homilies—if Dr. Oliver, or any other gentleman who has a doubt in his mind as to the correctness of the rule laid down on this point, will take the trouble to go to the Poplar Union, he will there find a register, kept for the last five years, of all the cases of cholera which have occurred during that time; and as the 870 cases inserted in that register have attached to each the name of the medical gentleman who attended the case, it will be seen that six-and-thirty medical gentlemen have certified that a premonitory diarrhoea existed in every one of these 870 cases, for a longer or shorter period; and if he will further inquire, he will find that I have not the advantage to be known to twenty-four of these gentlemen, consequently their testimony cannot be taxed with partiality; all I have no doubt, were actuated in their researches by the same motives which actuated Dr. Bain and Mr. Webb—the sincere desire for accurate pathological information, and the no less sincere desire to refute by facts an opponent to the dogma they had so long respected.

In taking leave of this subject, permit me, through the medium of your journal to express my sincere thanks to the clerk of the Poplar Union, Mr. Symons, who, with a firmness of purpose which does him the greatest credit, has, while cholera raged, day by day seen that the daily reports of the medical attendants on the cases of cholera were collected and inserted in the above register.

And I do not forget the deep debt of gratitude which is due by the profession and by the public to the medical gentlemen of this union who, by their careful and minute investigations at the bed-side, and by recording daily the result of their inquiries, have done more for the advancement of our knowledge of the pathology of cholera than has yet been done by the efforts of any collection of individuals, or by the efforts of any government in any country.

I have the honour to be, Sir, your obedient servant,

D. MACLOUGHLIN, M.D.,

Member of the Legion of Honour.

Bruton-street, Berkeley-square, October, 1864.

## THE LATE FEARFUL CATASTROPHE AT NEWCASTLE.

To the Editor of THE LANCET.

SIR,—It would, I think, be highly interesting to the members of the profession generally, if their brethren in Newcastle would mark the effects of the late terrific explosion and fire on the offspring of those women who were at the time in a state of pregnancy, and transmit the same to the profession, as soon as interesting cases come under their notice.

I happened, the other day, to meet with a most extraordinary account given by Baron Percy, an eminent French military surgeon and professor, said to have occurred after the siege of Landau, in 1793. If true, it is a most interesting fact, and one well worthy of deep investigation. He says, that "in addition to a violent cannonading, which kept the women for some time in a constant state of alarm, the arsenal blew up with a terrific explosion which few could listen to with unshaken nerves." Out of ninety-two children born in the district within a few months afterwards, he states, that "sixteen died at the instant of birth; thirty-three languished for from eight to ten months, and then died; eight became idiotic, and died before the age of five years; and two came into the world with numerous fractures of the bones of the limbs, caused by the convulsive starts in the mother, excited by the cannonading and explosion!"

Here, then, is a total of nearly two out of three actually killed through the medium of the mother's alarm, and its natural consequence upon her own organization. These facts, if true, are, as I have said, highly interesting; and the professional men at Newcastle have now an excellent opportunity of testing the truths of them. Hoping that this subject may be thought worthy of investigation,—Believe me, Sir, yours obediently,

October, 1864.

J. R. L.

BIRMINGHAM GENERAL HOSPITAL.—At the weekly meeting of the Board, held on Thursday week, Lord Calthorpe in the chair, Dr. Evans, one of the physicians, announced that he was the bearer of a munificent donation to the hospital of £1000, for the benefit of the permanent fund for "accidents and urgent cases." The donor wished only to be known by the cognomen of "Delta."

## THE CHOLERA.

RELATIVE to the progress of cholera in the metropolis, we condense the following from the "Weekly Return" of the Registrar-General for the week ending October 7th:—

Districts.	Elevation above water mark.	Population (1861).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	26
Central (St. Giles, &c.).....	49 "	393,256	31
Western (Kensington, &c.)	28 "	376,427	59
Eastern (Shoreditch, &c.)...	26 "	485,522	95
Southern (St. Saviour's, Lambeth, &c.) }	6 "	616,635	200
			411

Of these, 118 were under 15 years of age; 236 were above 15 and under 60; 57 were above 60 years old. 98 are stated to have died from diarrhoea.

It is gratifying to be able to state that the improvement in the public health is visible generally in the metropolis, though it appears to be more slow in the Eastern and Southern districts than in other parts. The total deaths from cholera were 754 in the last week of September; they declined to 411 in the week that ended last Saturday. The deaths from diarrhoea in the same times were 165 and 96. The returns of cholera for the last two weeks give 113 and 59 in the Western districts, 50 and 26 in the Northern, 62 and 31 in the Central, 146 and 95 in the Eastern, and 383 and 200 in the Southern districts.

We have been informed that no instance of cholera has occurred in the Pentonville Prison during the present epidemic, but that the number of diarrhoea cases was unusually high. As a general rule, the treatment by sulphuric acid was adopted, but where pain or debility were excessive, opium or ether was added to the acid. All the cases recovered. In a communication from Dr. James G. Davey, we are told that the author regrets very much to see in our "last week's issue, a somewhat unqualified denial of the advantages and success of the purgative treatment of 'Cholera,' so called," and that "the great object of all and whatever treatment in cholera is, to restore the suspended functions of the vital (abdominal) organs, and this can be accomplished only by purgatives and stimulants variously combined and assiduously persevered in." Dr. Davey also remarks, that by reference to his former communications (October, 1842; May, 1854) to this journal, "Drs. Outram, Johnson, and Stark, and Messrs Crummev and Burke will perceive not only that the purgative treatment of cholera, so called, is by no means 'so novel' as they have supposed it to be, but that it has been the practice from 1834 to the present time" of Dr. Davey himself. Mr. Boeth, in a pamphlet he has favoured us with,\* thus writes, "By the abstraction of oxygen from the atmosphere, or the presence of an undue proportion of nitrogen, it would follow as a matter of course, that new combinations of gaseous bodies with the nitrogen would be made, which would act on substantive matter in a peculiar manner. Suppose, therefore, that nitrogen were unduly present in the atmosphere, this, uniting with carbon, which is ever found in the air in one form or another, whether as carbonic acid gas, or in compounds of hydrogen and carbon, would form cyanogen or prussic acid under certain circumstances. Now, the cholera bears out such an hypothesis as this, for its action is precisely what cyanogen or prussic acid would be on the human frame." (p. 3.) "Oxygen, therefore, is the prime antidote for cholera as an elemental matter." (p. 8.) "It would appear that the only mode of getting rid of the cholera, is to extirpate every nuisance or matter that generates hydrogenous compounds." (p. 10.)

\* An Approximation and Research after the Choleraic Principle, and the Means to render the Causes innocuous. London. 1854. pp. 32.

**PATHOLOGICAL SOCIETY.**—The first meeting of the Society for the present session will be held at the Society's rooms, in George-street, Hanover-square, on Tuesday next, the 17th inst., at eight p.m. The volume of "Transactions" for the past year, which has just been distributed to the members, appears, from a hurried glance, to be one of the most valuable contributions to medical science published by this or any of the medical societies of London. The success which we had from its origin anticipated for the Society is fully realized in its being able to supply materials for a volume like the present.

## Medical News.

**ROYAL COLLEGE OF PHYSICIANS.**—At the usual quarterly meeting of the Comitia Majora, held on Saturday, the 30th ult., the following gentlemen, having passed the necessary examinations for diploma, were admitted Members of the College:—

Dr. GRIFFITH, Wellington-street, London-bridge.  
Dr. HAWKSLEY, George-street, Hanover-square.  
Dr. BOWKER, Newcastle, New South Wales.  
Dr. MARTYN, St. Michael's-hill, Bristol.  
Dr. COCKLE, Guildford-street.

Also,—

Dr. JONES, Heidelberg, and  
Dr. GILMOUR, Liverpool,

were admitted as extra Licentiatees.

**ROYAL COLLEGE OF SURGEONS.**—The following gentlemen having undergone the necessary examinations for the diploma, were admitted Members of the College at the meeting of the Court of Examiners on the 6th inst.:—

BELLEW, HENRY WALTER, H.E.I.C.S., Bengal.  
BROMLEY, EDWARD HARE, Beaufort Iron Works, Monmouthshire.  
CORBETT, AUGUSTUS MEYERS, Kingston, Canada West.  
CROFT, JOHN, Lower Clapton.  
DODD, HENRY, Durham.  
GRANT, ALEXANDER, Aberdeen.  
LOWDELL, SYDNEY POOLE, Royal Mail Service.  
MARSHALL, HENRY, Edinburgh.  
NEWMAN, WILLIAM, Bradfield, Sheffield.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, October 5th, 1854.

BELLEW, HENRY WALTER, H.E.I.C.'s Service, Bengal.  
DICKSON, JOSEPH, Whitehaven.  
VIZE, AMBROSE BLITHE, Holbeach, Lincolnshire.

**EXAMINATIONS AT THE ROYAL COLLEGE OF SURGEONS.**—During the past year, one candidate in every six was rejected by the Court of Examiners.

**ST. GEORGE'S HOSPITAL MEDICAL SCHOOL.**—In noticing the introductory lectures at the various schools of medicine, in our last impression, we had not space for the names of the successful candidates in the several classes at this institution. The award of honours took place on Monday, the 2nd instant, Dr. Wilson, senior physician to the hospital, being in the chair:—*Scholarships:* Mr. Wm. Sutton, Halstead, Essex; Mr. Charles Hunter, Wilton-place, Belgrave-square; Mr. Robert L. Bowles, Abergavenny.—*Dr. Chambers' Prize:* Mr. William Dickinson, London.—*Sir Charles Clarke's Prize:* Mr. Wm. Dickinson.—*Anatomy:* Senior Class, Prize, Mr. Chas. Roberts, Gloucester-terrace, Paddington; Junior Class, Prize, Mr. Chas. Hunter, Mr. Robert L. Bowles, equal; Certificate, Mr. Shirley E. Woolmer.—*Physiology:* Prize, Mr. John H. Hooper, Fulham; Certificate, Mr. Charles Roberts, Paddington.—*Botany:* Prize, Mr. Shirley E. Woolmer, Pimlico.—*Chemistry:* Prize, Mr. E. J. Marshall, Walsall; Certificate, Mr. William Sutton, Mr. Robert L. Bowles.—*Practical Chemistry:* Prize, Mr. Henry Charles Andrews, New Bond-street, London; Certificates, Mr. Albert S. P. Knight, Pimlico; Mr. Chas. Roberts; Mr. John H. Hooper.—*Materia Medica:* Prize, Mr. William Sutton; Certificates, Mr. Shirley E. Woolmer, Mr. H. Lewis, Mr. Charles Hunter, Mr. S. Courtney.—*Medical Jurisprudence:* Prize, Mr. Henry Chas. Andrews, New Bond-street, London; Certificate, Mr. Charles Roberts, Paddington.—*Midwifery:* Prize, Mr. John H. Hooper, Fulham; Certificates, Mr. Henry Charles Andrews, Mr. E. J. Marshall.—*Practice of Physic:* Prize, Mr. Henry W. Bellew, Plymouth; Certificate, Mr. Wm. Dickinson.—*Surgery:* Prize, Mr. James Keene; Certificates, Mr. Henry W. Bellew, Mr. J. D. Prytherch.

**MEDICAL SOCIETY OF LONDON.**—The first meeting for the session will be held this evening, (Saturday,) at eight P.M., at the Society-house, George-street, Hanover-square. The President, Mr. Headland, will read a paper on Cholera.

**HUNTERIAN SOCIETY.**—On Wednesday next, at eight o'clock P.M., Mr. N. Ward will read a communication, on a Case of Non-malignant Disease, involving the Septum of the Nose, Nasal Bones, and Part of the Superior Maxillary Bones.

**SUPPLY OF NURSES FOR THE SICK.**—THE EPIDEMIOLOGICAL SOCIETY AND THE BOARD OF HEALTH.—A deputation of a committee of the Epidemiological Society, appointed to consider a scheme for supplying the labouring classes with nurses in epidemic and other sickness, waited upon Sir Benj. Hall, the president of the Board of Health, on Friday, October 6th, for the purpose of explaining their views and the plan proposed by the committee. Dr. Babington, the president of the Epidemiological Society, introduced the deputation, which was attended by the following gentlemen: Dr. Sibson, Mr. Grainger, Dr. MacWilliam, Dr. Milroy, Dr. Hare, Dr. Carlile, Dr. Snow, Mr. Aldrich, Mr. Tucker, and Dr. Sieveking. Dr. Babington stated the general object of the committee, and called upon Dr. Sieveking, as one of the secretaries, to give a more detailed account of their proceedings. Dr. Sieveking explained the arguments upon which the proposition to supply nurses to the labouring classes on a national scale was based, and showed that it was desirable that some measure by which it could be done should be carried, on medical, on sanitary, and on politico-economical grounds. He briefly alluded to the plan suggested by the committee, according to which the workhouse infirmaries should be made available for training females admitted into the workhouse as nurses. Sir Benjamin Hall highly approved of the proposition, and advised the committee what steps to take in order to secure the further consideration of the Board of Health for the plan. After a few words from Dr. Sibson and Mr. Grainger in support of the views advocated by the committee, the deputation withdrew.

**QUEEN'S COLLEGE, BIRMINGHAM.**—The Introductory Lecture to the opening of the medical classes was given by Mr. R. D. Grainger, before a numerous and highly influential company, on the Importance of Sanatory Reform. He showed by statistics the mortality and sickness which might be prevented by proper precautionary measures, particularly amongst the infantine population. He proved that, though the chief mortality would be in the ranks of the poor, the rich, as had been shown of late, would also fall victims. He urged upon his audience that they had no security for life whilst they lived surrounded by a tainted atmosphere, which they could easily purify by ordinary diligence and attention to the wants and interests of those around them.

**LEEDS MEDICAL SCHOOL.**—Mr. Ikin gave the Introductory Address at this School. He divided his lecture into the four following heads, upon which he enlarged with much eloquence:—First, he alluded to the foundation and progress of the Leeds School of Medicine; secondly, he pointed out the branches of medical science that would occupy the attention of the student; thirdly, he referred to the relations of medical art to science and literature generally, to the State, and to the public service; fourthly, he dwelt on our relations and duties to each other as members of a common profession, and the duties of students, destined as they are to become the future representatives of the noble arts of Medicine and Surgery.

**MEDICAL HOUSE-TO-HOUSE VISITATION.**—A letter addressed to Lord Palmerston by Dr. H. Gavin, one of the superintending medical inspectors of the General Board of Health, contains the following interesting and instructive facts, and brings under Lord Palmerston's notice a number of tables illustrating the results of the medical house-to-house visitation, as carried out in the towns of Newcastle, Dundee, and Glasgow. It appears from these that for every 26.6 persons afflicted with choleraic disease in its first stage, and who are aware of their danger and apply for advice, there are 73.4 persons who do not know their danger, and have to be sought out and placed under proper treatment; that for every 75 persons who are alarmed by the symptoms of the second stage and apply for assistance, there are 25 who still neglect this state of extreme danger; that for every 77.4 persons who have wholly neglected their condition until the third stage is fully developed, there are still 22.6 who, but for the system of house-to-house visitation, would be left to perish; that by this system medical aid is almost certain to be brought to every individual affected with the disease; and that by it also the probability of death of those attacked by the disease was diminished from 200 in a thousand to 3 per cent.

**MEDICAL MEN ON BOARD EMIGRANT SHIPS.**—A few days since, after an inquest held on the body of a child who had died on board of an emigrant ship at Liverpool, Mr. Curry, the coroner, made some very judicious remarks on the qualifications of medical men employed on board emigrant ships. He showed, from his experience in this matter, that the laws which regulate this important subject were most

defective, and that the remuneration to medical officers of these ships was so beggarly that no good men could be induced to go in them. He made some strong remarks on the entire question, and declared that such a state of things ought to be remedied, and he hoped his observations might tend to hasten the remedy. (Cheers.)

**THE MEDICAL STAFF IN THE BLACK SEA.**—As another illustration of the wretched condition to which our brave sailors in the Black Sea are reduced for want of medical assistance, we give the following extract from the correspondence of *The Times*' reporter:—"September 16th.—A most extraordinary occurrence, which deserves severe censure, took place yesterday. Signal was made from the *Emperor* for all ships to send their sick on board the *Kangaroo*. In the course of the day the last-named ship was surrounded by hundreds of boats laden with sick men, and the vessel was speedily crowded to suffocation. Before evening she had about 1500 invalids in all stages of suffering on board. The scene is described as appalling, in fact, too frightful for the details to be dwelt upon. When the time for sailing arrived, the *Kangaroo* hoisted the signal in reply to orders to proceed, 'It is a dangerous experiment.' The *Emperor* then signalled, 'What do you mean?' The reply was, 'The ship is unmanageable.' All the day she was lying with the signal up, 'Send boats to our assistance;' and, at last, orders were given to transfer some of her melancholy freight to other vessels also proceeding to Constantinople. Many deaths occurred on board; many miserable scenes took place; but there is, alas! no use in describing them. *It is clear, however, that neither afloat nor on shore is the medical staff nearly sufficient.* I, myself, saw men dying on the beach, on the line of march, and in bivouac, without any medical assistance; and this within hail of a fleet of 500 sail, and within sight of head quarters! We want more surgeons, both in the fleet and in the army. Often, too often, medical aid cannot be had at all, and it frequently comes too late." Our readers are well aware that this scarcity of naval medical officers is owing to the wretched treatment received by those already in the Royal Navy, deterring any but a *certain few* from joining that branch of the public service; it therefore becomes a more important duty than ever that our medical friends on shore should address the legislature by numerous petitions on the grievances and claims of their naval medical brethren. During the past week, the medical men of Salisbury, Winchester, Southampton, &c., have signed petitions for this laudable object, and it is to be hoped, that large as the number was which were presented during the past session, that in the ensuing parliamentary campaign they may be more than doubled. Those desirous of co-operating in this good cause, should address Mr. Stone, jun., 99, Albany-street, Regent's-park, who will take charge of petitions and forward them for presentation.

**LIVERPOOL SURGEONS.**—A curious scene occurred lately at a coroner's inquest in Liverpool. Two children died on board an emigrant ship, but wrong certificates were given as to the cause of death. "It is not long ago," said the Coroner, "I missed one of the porters at the Northern Hospital. I said, 'Has he gone?' 'Yes, sir,' was the reply; 'he has gone out physician on board ship.' This must certainly be put down," continued the Coroner, "and, if nothing else can be done, I shall draw the attention of Government to it. Here, to-day, we find Rosina Schatta, aged thirty-seven, said to die from apoplexy, but the medical man attached to the court has made a post-mortem examination, and it turns out no apoplexy, but pneumonia." There must be some regular Government officer, or registration, to prevent such cruelty.

**NORFOLK AND NORWICH HOSPITAL.**—**MR. DALRYMPLE'S RESIGNATION.**—The Board of Management of the Norfolk and Norwich Hospital, on receiving the resignation of Mr. Archibald Dalrymple, one of their surgeons, on the 23rd of September last, unanimously adopted the following resolution:—"The Board of Management cannot record the resignation of Mr. Archibald Dalrymple, one of the surgeons of this hospital, without at the same time recording their great regret that he should have found it requisite, on account of the state of his health, to take that step. The Board, in reviewing the past connexion of Mr. Dalrymple with this hospital, commencing with his election as assistant surgeon, in the year 1839, and as one of the surgeons, in 1847, desire to express their deep sense of his exceedingly valuable services to the hospital, their unanimous appreciation of his great kindness to the patients, and their hope that a short respite from the arduous duties of his profession may enable him to resume those duties with comfort to himself and benefit to the public."

**TESTIMONIAL TO A SURGEON.**—On Tuesday morning week, Mr. Wilson, the president of the Lancashire and Cheshire Branch of the Provincial Medical and Surgical Association, and the members of the Executive Committee, waited as a deputation, upon John Hatton, Esq., surgeon, the Honorary Secretary of the Branch, with whom they had been appointed to make arrangements for the recent anniversary meeting, and presented him with a valuable piece of plate, appropriately inscribed as follows:—"Presented to John Hatton, Esq., F.R.C.S., by the Executive Committee of the Provincial Medical and Surgical Association in Manchester, 1854, in testimony of their esteem for his personal character, and in appreciation of the talent and zeal which he exhibited upon that occasion as their Honorary Secretary.—William James Wilson, President."

We have much pleasure in calling the attention of the profession, and, indeed, we may here say of the public at large, to a portrait in lithography of R. D. Grainger, Esq., just published by Mr. Highley. The artist, Mr. Teniswood, has broad, vigorous handling, which has been well rendered by the lithographer, Mr. Lynch. We have no doubt the able likeness before us will meet with an extensive circulation.

**THE BATTLE OF THE ALMA.**—Mr. A. Gordon, surgeon to the 95th Regt., was wounded, on the 20th ult., during the terrific engagement with the Russians in the Crimea.

**THE BISHOP OF BORNEO.**—This distinguished prelate is a member of our profession, having been admitted a Member of the Royal College of Surgeons of England on the 3rd of June, 1839; and, at the last meeting of the Council, the Rev. Dr. Francis Thomas M'Dougall was elected a Fellow of the College.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, OCTOBER 7TH.**—The deaths in London from all causes, which in the first week of September rose to 3413, and in the three weeks following were 2836, 2504, and 2216, fell in the last week (the first week of October) to 1532. In the first week of October, 1849, the total number of deaths registered was 1290. The deaths from cholera were 411, and from diarrhoea, 98.

At the Royal Observatory, Greenwich, the mean height of the barometer in the week was 29.710 in.; on Sunday the mean reading was 30.063 in. The mean temperature of the week was 53.6°, which is 1° above the average of the same week in 38 years. The highest temperature occurred on Monday and Thursday, and was 72.8°; and on the latter day the mean temperature was 60.6°, being 8.2° above the average; on the two following days it was below the average. The mean dew-point temperature of the week was 48.1°, and the difference between this and the air temperature was 5.5°. The air was calm in the first part of the week; on Wednesday and Thursday the wind blew from the south-west, and at the end of the week was in the north-east. Rain to the amount of 0.45 in. fell on the last two days.

## Obituary.

On the 4th instant, at Brighton, after a long and severe illness, **RICHARD ROWLAND, M.D.**, of Woburn-place, Russell-square. The deceased gentleman was about fifty-six years of age. He was an M.D. of Edinburgh, 1827, and a Fellow of the Royal College of Physicians, London. He was also Assistant-Physician and Lecturer on the Practice of Medicine and Clinical Medicine at the Charing-cross Hospital. He was author of "A Treatise on Neuralgia," 1833; the article "Bronchocele" in the "Library of Medicine;" and another contribution to the same publication in 1851, "On Softening of the Brain." He was a man of very dignified and reserved disposition, but withal possessed of great suavity and kindness of manner.

**THE LATE DR. ROUPPELL.**—The committee of the Holloway and North Islington Dispensary held a meeting, on Monday evening last, (S. Lewis, Esq., in the chair,) at the Dispensary house of the institution, when the following resolution in connexion with the late lamented gentleman was passed unanimously:—"Resolved, That this meeting desires to express its deep sense of the loss the charity has sustained by the lamented death of its senior consulting-physician, Dr. Roupell. He took a warm interest in the affairs of the institution, to which he was a liberal contributor; and when the epidemic prevailed in 1849, he suggested the formation of a convalescent fund for supplying patients recovering from sickness with wine and nourishing food, which has since proved a great boon to the

suffering poor. His eminent talents, agreeable manners, and affectionate disposition were highly appreciated by the several members of the medical staff, who, with the committee and the governors at large, sincerely lament his loss."

At Sydney, JOHN HARRISON, surgeon, formerly of Blandford, Dorset, in the fiftieth year of his age.

On board the *Ben Nevis*, emigrant ship, at Queen's-town, of cholera, Dr. BLENNERHASSETT, late of Tralee.

At Rangoon, Assistant-surgeon J. W. FIRMINER, 19th Regiment Native Infantry.

At Edinburgh, after a few hours' illness, JOHN MACKAY, M.D.

At Weatherfield-hall, Essex, THOMAS TROLLOPE, surgeon, aged fifty-seven.

#### TERMS FOR ADVERTISING.

The following is the Scale of Charges for Advertisements:—

For 7 lines and under..... £0 4 6 | For half a page ..... £2 12 0  
For every additional line ... 0 0 6 | For a page ..... 5 0 0

Advertisements which are intended to appear in *THE LANCET* of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of *THE LANCET* far exceeds that of any other Medical Journal in the world.

#### TERMS OF SUBSCRIPTION TO "THE LANCET."

One Year ... .. £1 14 8  
Six Months... .. 0 17 4  
Three Months ... .. 0 8 8

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, *THE LANCET* Office, 433, Strand, London, and made payable to him at the Strand Post Office.

#### TO CORRESPONDENTS.

*University of Oxford: Examinations for the Degree of M.D.*—We have been furnished with the following official statement by the kindness of Mr. Bowden, the Registrar of the University. Candidates are required—

"1st. To perform the exercises called Responsions, consisting of an examination in one Latin and one Greek author, Arithmetic, two books of Euclid, or Algebra to Simple Equations inclusively.

"2nd. To pass the first public examination called Moderations, consisting of the Four Gospels in Greek; one Latin and one Greek author, of which one must be a poet, the other an orator; a paper of Mathematical or Logical questions.

"3rd. To pass the second public examination in two schools at least—first school to be passed first, and by all that of 'Literæ Humaniores'; second school, Mathematics; third school, Natural Science; fourth school, Law and Modern History. Of these schools the candidate has his choice. Between the first and second public examinations an attendance at two courses of public lectures is necessary.

"In Medicine, all students (besides undergoing the three examinations appointed for Bachelors of Arts) are to be examined in the Theory and Practice of Medicine, Anatomy, Physiology, and Pathology; in *Materia Medica*, and in Chemistry and Botany, so far as they illustrate the science of Medicine; and in two at least of the following ancient medical writers: Hippocrates, Aristotle, Galen, and Celsus. For a Doctor's degree in Medicine, a dissertation upon some subject, to be approved of by the Regius Professor of Medicine, is to be publicly recited in the schools, and a copy of it afterwards delivered to the Professor.

"Medical examinations take place once in each year—viz., in Trinity Term. Degrees can be conferred on any public degree day."

*N. G.*—The cases, if short and practical, would be acceptable.

*A Junior Practitioner.*—In the hospital named, the acid treatment proved the most successful.

*Mr. Allen.*—The museum at the College of Surgeons contains a specimen. An admission order might be obtained from a member.

*Nemo.*—It is stated that cholera has not penetrated the older districts.

*M.D., (Carlów.)*—The presence of both rye and rice-flour, when mixed with wheat-flour, is very readily discoverable by means of the microscope; but the detection of barley-flour, when in wheat-flour, is much more difficult; and if the barley constitute only a third of the article, it would be hazardous in many cases to pronounce with confidence that the wheat-flour was adulterated with the farina of the cereal in question.

The correspondent who addresses us from Deptford must give a fuller account of the case, and communicate his name in confidence.

*Mr. Thomas Black.*—Such conduct was not polite on the part of the functionary.

*Dr. Alexander Wood (Edinburgh)* is thanked for his communication.

*Tyro.*—The examination is not compulsory. It is, however, desirable for a candidate for the Honours to subject himself to the ordeal. Full information on the other point mooted may be obtained on application to Mr. Upton, at Apothecaries' Hall.

*Dr. C. B. Garrett* is thanked for his polite note.

The conclusion of *Mr. Chalmers'* lecture on "Suppuration of the Joints" is again unavoidably postponed.

*Amicus.*—At present there is a great deficiency of assistant-surgeons in the Baltic fleet. In most of the ships the assistant-surgeon has no separate cabin assigned to him, notwithstanding the resolution which was come to by the House of Commons on the subject. The comforts and interests of the profession have been disregarded by some of the naval authorities. There is no truth in the assertion that there are many well-qualified candidates for the office of assistant-surgeon.

*A. B.*—Residence is not necessary. The examination is by written and *vide* voce questions. Gentlemen in actual practice are not expected to go into the minutiae of the elementary sciences, their examination being confined chiefly to practical subjects.

*A Student.*—Complaints such as that forwarded should be made, in the first instance, to the authorities at the hospital, who, we believe, would take immediate steps to procure a remedy for the abuse detailed. There is good reason to believe that the existence of the evil is not countenanced by those in power.

*A Member.*—No. Not in England or Wales.

*Dr. Henry Hancock.*—We believe that the fee named, though most paltry and inadequate, is the legal one.

*Dr. Bayes.*—We cannot depart from the usual rule, of not admitting author's reclamations against our reviews of their books. When a writer transmits us his work, it is implied he wishes to know our opinion of it. If in intimating our judgment of the one in question, we have been wanting in "courtesy of expression," (to which, however, we cannot plead guilty,) we beg to assure Dr. Bayes it must have been in our warmth against the various "pathies" that now threaten to encumber the outskirts of legitimate medicine, and not as towards him. We stated our regret that one of so good a position as Dr. Bayes should venture on so delicate a matter as "kinesopathy."

*Zelus.*—A licentiate in Midwifery is not entitled by law to practise either as a surgeon or apothecary. We believe that up to the present time no "unqualified" person has received a licence to practise midwifery from the Royal College of Surgeons. Under a better regulation of the profession there are many anomalies which would cease to exist.

*Pater.*—Most of the provincial schools of medicine offer the same advantages to a student as those of the metropolis.

*Civis* is thanked; but the subject has already engaged our attention.

*A Young Microscopist.*—Some very interesting results will shortly be published on the subject.

*R. N., (Portsmouth.)*—An authentic statement relative to the affair would receive our best attention. We cannot notice anonymous communications.

*A Cholera Patient.*—Yes. The matter might be brought before the board of guardians. The medical gentleman named was not obliged to supply medicine in the case.

*Purgator.*—There are certain publications so essentially contemptible, that any kind of notice which seems to imply a consciousness of their crawling existence is hailed by them with paroxysms of delight. The editor of *The Times* is not aware that the prints our correspondent mentions are in existence. *THE LANCET* (Heaven forgive us!) was the publication that first brought the *castor oil treatment* under the notice of the profession, and it was also the first to denounce it as unscientific, dangerous, and fatal.

#### AN OBLIGING OFFER.

At the meeting of the board of guardians, on Saturday last, the following letter, communicated to the clerk, was read:—

"Blackburn, September, 1854.

"DEAR SIR,—On perusing the *Gazette* I find that the cholera has once more made its appearance amongst you, more particularly at Poulton. I feel confident if a few of my cholera mixtures were placed in the hands of parties in authority, where they could be had on applying for, with a few directions as regards diet, &c., the greater part, if not all, would recover. My success has been such in the treatment of the disease, that I can no longer remain silent.

"You are at liberty to make use of this letter in any way you think proper.

"I am, Sir, yours respectfully,

"R. LEACK, Surgeon.

"P.S.—The mixture will keep for any length of time, and in any climate. I should not have ventured to make these remarks had I not known the great interest you took in watching the treatment during the late epidemic.—R. L."—*Lancaster Gazette.*

*Mr. J. J. Beale* shall be answered by a private note.

*Chirurgicus.*—We entertain an opinion directly contrary to the one announced by our correspondent. Dr. Hall, we think, wrote hastily and undesignedly; and we consider that Mr. Syme is perfectly right when he states, "that so far as the safety of operations may be in question, chloroform proves useful directly in proportion to the severity of the injury or disease, and the degree of exhaustion or shock."

*Mr. Henry Thompson's* "Case of Calculus Vesicæ in a Girl," and other valuable original papers, already in type, are postponed, but will probably appear in our next.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. Marshall Hall; Dr. Ramskill; Dr. Mackinlay, (Isleworth); Mr. Lonsdale; Dr. Alex. Wood, (Edinburgh); Mr. J. J. Beale; M.R.C.S. and L.S.A.; Dr. Hancock; Pater; A Surgeon R.N.; J. E. T., (Baltic Fleet); Amicus, (Manchester); Mr. Weston; A Young Microscopist; Mr. Williams; R. N.; A Cholera Patient; A Member; Dr. Bayes, (Brighton); A Friend to the Poor; The Secretary of the Kent County Ophthalmic Hospital; Dr. Ayre, (Hull); N. G.; A Junior Practitioner; W. W.; Mr. Allen; M.D., (Carlów); Mr. Thomas Black; Dr. C. B. Garrett; A. B.; A Student; Tyro; Rurus; Civis; Purgator; Chirurgicus; Dr. Scriven, (Roundtown, with enclosure); Dr. Fyfe, (King's College, Aberdeen, with enclosure); A. T., (Deptford); &c. &c.

**Hooper's Invalid Water Cushions and Mattresses, or Beds, for Bed-sores,** whether threatened with Sloughing, or in which Sloughing has actually taken place.—Fractures, Diseased Joints, Ulcerated Cartilages, Paralysis, Spinal Affections, Renal Diseases, Inflammation of the Bowels, Spasms, Lassitude, Typhoid and other Fevers, Gout and Rheumatic Affection, Cancer, Ovaria Droopy, Coldness of the Stomach and Feet, Consumptive, and all Bed-ridden Patients. Mr. HOOPER has succeeded in obtaining Waterproof Sheetting (Bed Protectors) at a Great Reduction in Price, Free from Smell, and not affected by Temperature, Urine, Acids, or Alkalies; and, MAY BE WASHED AS FAMILY LINEN. Also—

## IMPROVED URINALS, AND ELASTIC BED PANS, OR RECEP TACLES,

INDIA-RUBBER, ENEMA, and DOUCHE, answering equally for either purpose, and may be carried in the Pocket.

For Hospitals and other Institutions a Discount is allowed. Their advantages over the costly and cumbersome Water Beds have been published in the Medical Journals, and they are particularly applicable for Paralytic and Lunatic Patients.

"I HAVE in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water-Bed."

"JONN. PEREIRA, M.D.,

"Physician to the London Hospital.

"Finsbury-square,  
"February 27, 1852."

"North Wales Lunatic Asylum.

"SIR,  
"Your Water Cushions and Mattresses answer most admirably; indeed, they are invaluable. They have been in use here for eighteen months.

"Jan. 1854."

"R. L. WILLIAMS, M.D., Visit. Phys.

INVALID CUSHION,  
FOR GENERAL PURPOSES.

CUSHION MORE ESPECIALLY USEFUL FOR SLOUGHING  
OVER THE SACRUM.

CIRCULAR CUSHION, FOR SITTING ON.

MATRESS OF AN INTERMEDIATE SIZE.

FULL-LENGTH INVALID MATRESS OR BED.

Being greatly preferable to the original costly and cumbersome Water Bed. The above are simply to be placed on an ordinary Bedstead.

## HOOPER'S SPIRAL SUPPORTERS.

[The Figures 1, 2, 3, &c., show the points at which measures should be taken in circumference.]

KNEE CAP,

SPIRAL SUPPORTER.

ABDOMINAL SUPPORTER.

ANKLE SOCK.

STOCKING.

HOOPER, 7, PALL MALL EAST, AND 55, GROSVENOR STREET, LONDON.

## GOLD CHAINS AND JEWELLERY.

**Watherston and Brogden, Wholesale Manufacturing Goldsmiths and JEWELLERS**, beg to announce to the Nobility, Gentry, and Public in general, that in obedience to the numerous calls made upon them since the Great Exhibition, where they were awarded a Prize Medal, they have resolved to throw open their Manufactory to the Public at Manufacturers' prices, a closer connexion than has hitherto existed between the real worker in the precious metals and the Public being obviously an advantage to both parties. Gold is capable of being alloyed to any extent, and therefore, in order to protect the Public in the article of Chains, Watherston and Brogden will make the Mint price of 77s. 10½d. per oz. for British standard the basis of all their operations, and, making their profit on the workmanship alone, will charge the bullion in their Chains at its intrinsic value, undertaking to re-purchase it at any time at the same price: thus—15 carat gold will be charged and will realize 53s. 1d. per oz.; 18 carat gold will be charged and will realize 63s. 8½d. per oz.; 22 carat gold will be charged the Mint price of 77s. 10½d. The price for workmanship will be charged according to the intricacy or simplicity of the pattern: for example—a Chain weighing 2 oz. of 15 carat gold is worth, at 53s. 1d. per oz., £5 6s. 2d. intrinsic value; supposing the workmanship to be £2, total £7 6s. 2d. By this arrangement the purchaser will see at a glance the proportion charged for labour compared with the bullion in a Gold Chain, and, being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of Jewellery, all made at their Manufactory, 16, HENRIETTA STREET, COVENT GARDEN. (Established 1798.)

## CAUTION.

KNEE CAP AND ANKLE PIECE.

ABDOMINAL SUPPORTER.

SPINAL SUPPORTER.

STOCKING AND THIGH PIECE.

**Mr. Bourjeaud**, in submitting the above four Engravings as illustrating the nature and special design of his Apparatuses, most earnestly begs to call the attention of Professional Gentlemen to the gross and nefarious practices of unprincipled parties, who attempt to impose on the Public by advertising their spurious apparatuses, accompanied with the closest imitations of his diagrams, and with the use even of the same words and plan of measurement, in order to obtain, by these fraudulent means, a portion of the patronage with which he has been especially honoured by the Profession. Mr. Bourjeaud wishes, therefore, to caution Medical Gentlemen against the dishonest proceedings of his imitators, and hopes they will not accept any of the appliances put forward under the name of Spiral Supporter, except the articles come from his own Establishment, No. 11, Davies-street, Berkeley-square, (opposite Mivart's Hotel,) London; and No. 17, Rue des Beaux Arts, Paris.

## Anatomical and Dental Repository,

45, Museum-street, Bloomsbury, London.—**JOHN HARNETT** begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

## Mr. Edwin Osborne, of 24, Savile-

ROW, LONDON, begs to apprise the patrons of the late Firm of Dodge and Osborne, that he is now the Sole Licencee and Maker of **PALMER'S PATENT (American) LEG**; and, having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given (if required).

## Dissecting and Post-Mortem Instru-

**MENTS**, New and Second-hand. Surgical Instruments of the best description; A. URE'S New Urethrotome for Stricture; New Uterine Compress; Newly Improved Pessary; Instruments for Army and Navy Surgeons; **DARTNELL'S Patent Truss**; Trusses for Union Surgeons; Enema Syringes; New Syphon Enema, as supplied to the Army; New Spinal Machine, pronounced the best ever invented—at

**PRATT'S, Surgical Instrument Maker, 420, Oxford-street.**

## Poultices superseded by the use of MARKWICK'S PATENT SPONGIO PILINE.

As a substitute for common poultices and fomentations, the superiority of this article is unquestionable. It is strongly recommended by the most eminent of the Faculty for its cleanliness, economy, lightness, and general efficacy, and is now used in several of the hospitals. Also Markwick's Patent Piline, for Cholera Belts, Rheumatism, Chest Protectors, Respirators, Lumbago, &c.

Sold, retail, by Chemists and Druggists, and wholesale only by **GEORGE TRIMBEY, 41, Queen-street, Cheapside.**

## Elastic Supporting Belts, of the same

beautiful fabric as Pope and Plante's Elastic Stockings for Varicose Veins. Those for ladies' use, before and after accouchement, are ADMIRABLY ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed.

Instructions for measurement and prices on application, and the articles sent by post from the manufacturers, **POPE and PLANTE, 4, Waterloo-place, Pall Mall, London.**

## Walters' India-rubber URINALS.

**F. WALTERS** having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

Made of Solid India-rubber, with Patent Valve, and adapted for Ladies, Gentlemen, and Children.

Manufacturer also of the **PATENT HYDRO-STATIC TRUSS**. One of the advantages of this Truss is, that the pad, being filled with water, adapts itself with perfect accuracy to the form of the body, thereby keeping up a firm but easy pressure on the internal ring.

**F. WALTERS,**

16, MOORGATE-STREET, LONDON.

**Allsopp's Pale Ale in Bottle, as**  
supplied to the CRYSTAL PALACE; also in casks of 18 gallons.  
Recommended by BARON LIEBIG.

Address, HARRINGTON PARKER and CO., 54, Pall-Mall, London.

**Pale India Ale and Stout, 4s. 6d.**

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.

WOOD & WATSON, 16, Clement's-lane, City.

**Allsopp's Pale Ale.—Medical gentle-**

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

**Soyer's Aromatic Mustard.—"M."**

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration.—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

**To Invalids and those desirous of**

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO'S HOMOEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

**Cocoa of the finest quality, prepared**

in the best possible manner.—Our PURE GRANULATED COCOA was pronounced by the Analytical Chemists employed by THE LANCET, in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 6d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congo Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s. for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

## DOMESTIC ECONOMY

**H. Sparrow and Co. beg to announce**

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Souchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

**Robinson's Patent Barley, for making**

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than thirty years, have been held in constant and increasing public estimation as the purest farinas of the oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

The proprietors of ROBINSON'S PATENT BARLEY and PATENT GROATS, desirous that the public shall at all times purchase these preparations in a perfectly sweet and fresh condition, respectfully inform them that every packet is now completely enveloped in the purest Tin-foil, over which is the usual and well-known paper wrapper.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets at 6d. and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

EAST INDIA HOUSE, Aug. 8th, 1854, and Oct. 4th, 1854.

**Notice is hereby given, that the**

annexed CODE OF REGULATIONS for the ADMISSION of CANDIDATES at the First Examination, to be held in January next, for the APPOINTMENT of ASSISTANT-SURGEONS in the service of the EAST INDIA COMPANY, has been framed by the Board of Commissioners for the affairs of India, under the provisions of the Act 18 and 17 Vic., cap. 95, sec. 38.

REGULATIONS FOR THE ADMISSION OF CANDIDATES FOR THE APPOINTMENT OF ASSISTANT-SURGEON IN THE SERVICE OF THE EAST INDIA COMPANY.

All natural-born subjects of her Majesty may be candidates for admission into the service of the East India Company as Assistant-Surgeons. They must, however, be between 22 and 28 years of age, and of sound bodily health.

They must subscribe and send in to Dr. Scott, the Physician to the Hon. East India Company, before the 10th day of December, 1854, a declaration to the following effect:—

"I [Christian and surname at full length], a candidate for employment as an assistant-surgeon in the service of the East India Company, do hereby declare that I was — years of age on the — day of — last, and that I labour under no constitutional disease or physical disability that can interfere with the due discharge of the duties of a medical officer; and I also attest my readiness to proceed on duty to India within three months of receiving my appointment."

This declaration must be accompanied by the following documents:—

1. Proof of age, either by extract from the register of the parish in which the candidate was born, or by his own declaration, pursuant to the Act 5 and 6 Wm. IV., c. 62.
2. A diploma in surgery, or a degree in medicine, provided an examination in surgery be required for such degree, from some body competent by law to grant or confer such diploma or degree.
3. A certificate of having attended two courses of lectures, of six months each, on the practice of physic, and of having attended for six months the practice and clinical instruction of the physicians at some hospital containing at least on an average one hundred in-patients, or of having attended one course of lectures of six months on the practice of physic, and clinical instruction for twelve months.
4. A certificate of having attended for three months the practical instruction given at one of the public asylums for the treatment of the insane.
5. A certificate of having attended for three months one of the institutions, or wards of a hospital especially devoted to the treatment of ophthalmic diseases.
6. A certificate of having attended a course of lectures on midwifery, and of having conducted at least six labours.
7. A certificate of having acquired a practical knowledge of cupping.

Candidates may also, at their option, send in certificates of attendance at any hospitals, or on any courses of lectures, in addition to the above. Attendance on a course of military surgery is recommended.

Candidates producing satisfactory certificates will be admitted to an examination to be held in January, 1855.

The examination will include the following subjects:—

1. Surgery in all its departments.
2. Medicine, including the Diseases of Women and Children, Therapeutics, Pharmacy, and Hygiene.
3. Anatomy and Physiology, including Comparative Anatomy.
4. Natural History, including Botany and Zoology.

The examination will be conducted:—

1. By means of written questions and answers.
2. By object examinations and experiments, when the subject admits of such tests.
3. By practical examination at the bedside of the patient, and by dissections and operations on the dead body.
4. By vivâ voce examination.

The persons who shall be pronounced by the examiners to be the best qualified in all respects, shall be appointed to fill the requisite number of appointments as assistant-surgeons in the East India Company's Service.

All assistant-surgeons are required to subscribe to the Military or Medical, and Medical-retiring Funds at the Presidencies to which they may be respectively appointed, and to the Military Orphan Society also, if appointed to Bengal.

All assistant-surgeons who shall neglect or refuse to proceed to India under the orders of the Court of Directors, within three months from the date of their appointments, will be considered as having forfeited them, unless special circumstances shall justify a departure from this regulation.

Candidates may apply to Dr. Scott, 13, Stratton-street, for further information if needed.

N.B. The certificates and notices as to examination herein contained apply only to the examination to be held in January next.

Regulations regarding the requirements of candidates for future examinations will be issued after the first examination.

JAMES C. MELVILL, Secretary.

NOTE, Oct. 4th, 1854.—Candidates who may not have been able to attend the practice of an asylum for the insane, or of an ophthalmic hospital for three months previous to offering themselves for examination in January, 1855, will not be excluded from examination, but will, if successful in obtaining recommendation for appointments, be required to produce certificates of having attended such practice during the interval between the examination and the time of proceeding to India.

The Board of Examiners of candidates for the appointments of assistant-surgeons in the East India Company's Service give notice, that on the 8th of January, 1855, they will hold examinations at the East India House for the selection of assistant-surgeons. The selection will be made according to merit, and it is expected that about thirty appointments will be awarded.

J. D. DICKINSON, Deputy-Secretary.

**Matrimonial Institution.—Founded**

1846.—Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CUTHEBERT, 12, John-street, Adelphi, London.
